THIS, the THIRD MEETING for the season, was held in the Surrey Zoological Gardens. The weather was favourable for the occasion, and the Exhibition was, in many respects, superior to the former meeting.—The MISCELLANEOUS COLLECTIONS OF PLANTS shown by *Amateurs* were deficient; but those produced by Gentlemen's Gardeners and Nurserymen were highly creditable. The best collection in the gardens was from Mr. Bruce, gr. to B. Miller, Esq., and comprised, among others, Achimenes longiflora and grandiflora, finely managed; Hoya carnosa, twining gracefully round a wire trellis; Siphocampylus betulifolius, flowering abundantly, and in excellent health; a good Clerodendron squamatum, and a pretty Euphorbia splendens, together with Pentas carnea, and several well-grown Heaths.—Mr. Atlee and Mr. Hamp also showed as Gentlemen's Gardeners, the former producing, among others, a very large plant of Erica intermedia, a tolerably-good Manettia cordata, but scarce of bloom; Hoya carnosa, and the useful Gardenia radicans, together with Burtonia conferta, Erica ampullacea, and Savileana, loaded with blossoms.—Mr. Hamp received a Large Silver Medal for a group containing the free-flowering Erica mutabilis, Clerodendron squamatum, a pot of Achimenes grandiflora, and a large Ipon œa.—In the *Nurserymen's Class* there were three exhibitors, viz. Mr. Jackson, Mr. Fairbairn, and Mr. Bushell. The group by Mr. Jackson was the best, and was awarded a Gold Medal. It included, among others, good plants of Statice incana, sinuata, and Dickensoni;

Hibiscus Cameroni, and a considerable number of Heaths, among which was an excellent Hartnelli, in luxuriant growth, its branches hanging over the pot, and feathered with healthy foliage; a magnificent bush of Jacksoni, and a good Westphalingia, quite a mass of bloom.—Mr. Fairbairn obtained a Large Silver Medal for Lilium eximium, having ten fully-expanded blossoms; a purple Petunia, named Beauty; some Fuchsias, and several young, but finely-managed Heaths.—Mr. Schroder and Mr. Cox showed in the Amateurs' Class, the former bringing the best plants, among which was a good Erica Irbyana; Boronia virminea, with small pink blossoms; Mimulus Frazeri, a pretty dark variety; Martynia fragrans, and a yellow Thunbergia, called Frazeri.—From Mr. Cox was Achimenes longiflora and grandiflora; Eucomis punctata, producing four spikes of green-coloured blossoms; a Gloxinia, and a plant of Lilium punctatum speciosum. Of Heaths there were two Collections present, one from Mr. Fairbairn, of Clapham, the other from Mr. Jackson, of Kingston. Of the two, that by Mr. Fairbairn was the best; it contained good plants of ampullacea vitata, a variety of ampullacea called s. nana; Savileana, in a lovely state; Jasminiflora alba, in fine health; and a dwarf, bushy plant of eximia, loaded with bloom.—From Mr. Jackson was tricolor superba, an excellent variety; cerinthoides, with brilliant scarlet blossoms; the free-flowering Savileana, a pretty Jasminiflora alba, a large princeps carnea, and a good eximia. Some Orchidaceæ were present, but among them there was nothing novel or particularly fine.—Mr. Don, gr. to G. F. Cox, Esq., received the First Prize, for Cattleya Harrisonii exhibited as a single specimen; and also for a Collection containing Miltonia spectabilis, Cycnoches chlorochilum, Broughtonia sanguinea, and Catasetum Russellianum.—A second group was from J. H. Schroder, Esq., in which were Vanda Roxburghi and Peristeria pendula, in fair condition.—The Second Prize, for the best single specimen, was awarded to Mr. Cuthill, for Lisianthus Russellianus, which had 18 stems, and was two years and four months old.—A well-grown Lisianthus Russellianus, finely in bloom, was also exhibited by Mr. Kay, gr. to B. D. Colvin, Esq., who likewise showed a tall Humea elegans, Mahernia incisa, Myoporum parviflorum, with white star-like blossoms, and some others.—Mr. Bruce was awarded a Large Silver Medal, for the best specimen plants of six distinct genera, among which was a fine Leschenaultia formosa, and a beautiful small Gardoquia Hookeri.—From Mr. Jennings, of South Lambeth, were Erica mammosa, Lotus Jacobæus, and some Fuchsias.—Among miscellaneous objects was a Collection of Cockscombs from Mr. Scorer; well-managed Balsams from Mr. Atterton; 7 good plants of Lisianthus Russellianus from Mr. Cuthill; a group of Cacti from Mr. Schroder; and a box of cut Indigenous Plants from Mr. Turner.—Of CUT ROSES, there was a good display; bunches of 12 varieties were shown by Mr. Edmonds, Mr. Parsons, and Mr. Paul, and good boxes of Cut Flowers were sent by Mr. Garty and Mr. Bruce.

The show of PICOTEES and CARNATIONS was upon an extensive scale, the number of competitors being very numerous, and the flowers in excellent condition. The tent devoted to this part of the Exhibition was crowded during the day, and the display of these beautiful flowers appeared to afford universal gratification. The Silver Cup, offered by Mr. J. Dickson for 12 white ground Picotees, to be contested for among the amateur members of the Society, was awarded to T. Barnard, Esq., for a remarkably fine stand of flowers, consisting of the following sorts:—Ely's Great Western, Sharp's Duke of Wellington, Ely's Favourite, Brinkler's Lady Emily, Wain's Victoria, Wildman's Isabella, Burrough's Lady Douro, Sharp's Gem, Green's Queen Victoria, Jessop's Sir W. Middleton, Wilson's Pluperfect, and Barnard's Mrs. Barnard.—To *Amateurs*, Members of the Society, the *Gold Medal* was awarded to Mr. Edmonds, for 12 blooms of white ground Picotees. This stand, which was very fine, consisted of Willmer's Princess Royal, Nulli secundus, Jessop's Sir W. Middleton, Orson's Adelaide, Green's Queen, Barraud's Cornelius, Ely's Grace Darling, Headley's Nannette, Gidden's Princess Royal and Teazer, Crask's Queen Victoria, and Brinkler's Purple Perfection.—*Large Silver Medal*, to the Rev. A. H. Matthews, who showed Dickson's Trip to Cambridge, Crask's Queen Victoria, Lady Alice Peel, Seedling, Enchantress, Ne plus Ultra, and Regina (seedlings also); Brinkler's Purple Perfection, Nulli Secundus, La Elegante, Sir R. Peel, and Lady de Grey.—*Middle Silver Medal* was awarded to — Proctor, jun., Bermondsey; to this collection no names were attached.—*Small Silver Medal*, to Mr. George Leach, for Burrough's Mrs. Bevan, Wilson's Pluperfect, Wain's Queen Victoria, Masson's Charlotte, Wilson's Harry, Willmer's Princess Royal, Barraud's Cornelius, Burrough's Lady Flower, Crask's Queen Victoria, Princess Augusta of Cambridge, Lady Payne, Miss Desborough.—For the best 12 blooms of Carnations, *the Large Silver Medal* was awarded to R. Headley, Esq.—no names attached. 2d, to Mr. Trevors, jun., *the Middle Silver Medal*—no names attached.—For Heartsease in stands of 24 varieties, *Middle Silver Medal*, Mr. J. Hunt; *Small Silver do.*, Mr. W. Hall.—Among *Gentlemen's Gardeners*, for 12 blooms of Carnations, *the Middle Silver Medal* was awarded to Mr. Eubleton, gr. to T. Barnard, Esq. This stand contained the following varieties:—Dation's Lancashire Lass, Hale's Prince Albert, Wilson's Harriet, Queen of Sheba, Greig's Mary, Barnard's Duke of Roxburgh, Martin's President, Roi Dagobert, Lord Pollington, Ely's Lady Ely, Willmer's Conquering Hero, Pucelle d'Orleans. 2d, *the Small Silver Medal* to Mr. Atterton—(no names.)—For 12 blooms of white ground Picotees, 1st, *Middle Silver Medal*, to Mr. Welch, gr. to G. Edmonds, Esq., for Kirtland's Wellington, Willmer's Princess Royal, Jessop's Sir W. Middleton, Barnard's Mrs. Barnard, Orson's Adelaide, Ely's Grace Darling, Green's Queen Victoria, Gidden's Princess Royal, Brinkler's Hope, Burrough's Lady Flower, Wood's Mrs. Vesey, and Sharp's Wellington.—For the 2d best stand, *the Small Silver Medal* was awarded to Mr. Embleton, gr. to T. Barnard, Esq.—Sharp's Duke of Wellington, Green's Queen Victoria, Nulli Secundus, Jessop's Sir W. Middleton, Wilson's Pluperfect, Wain's Queen Victoria, Willmer's Princess Royal, Wildman's Isabella, Ely's Grace Darling, Dickson's Trip to Cambridge, Crask's Queen Victoria, and Barnard's Mrs. Barnard.—Among NURSERYMEN and FLORISTS, for 12 blooms of Carnations, the 1st Prize, *Large Silver Medal*, was awarded to Mr. Willmer, for Willmer's Conquering Hero, Prince of Wales, Duke of Northumberland, Hufton's Lord Wellington, Addenbrook's Lydia, Puxley's Prince Albert, Sharp's Duke of York, Wilson's Harriet, Hepworth's True Briton, Brown's Dr. Watts, Brook's Flora's Garland, and Squire Meynell.—2d. *Middle Silver Medal*.—Mr. Norman, of Woolwich, for Wilson's Harriet, Hale's Prince Albert, Holmes's Count Paulina, Wigg's Earl of Leicester, Ely's Hugo Meynell, Mitchell's Patriot, Brook's Flora's Garland, Sharp's Defiance, Mausley's Bonny Bess, Roi du Capucin, Norman's B, and Low's Grand Sultan.—3d. *Small Silver Medal*.—Mr. Bates, of Oxford, for Wilson's Harriet, Hale's Prince Albert, Nix, Lord Chetwynd, Addenbrook's Lydia, Calcott's Brutus, Jones's Brilliant, Ely's Lady Ely, Hepworth's True Briton, Young's Earl Grey, Martin's Splendid, Toon's Prince Albert, Gregory's Alfred.—For the best 12 blooms of white ground Picotees. 1st Prize. *Large Silver Medal* to Mr. Willmer, of Sunbury, whose stand contained Willmer's Princess Royal, Gidden's Vespasian, Wildman's Isabella, Nulli Secundus, Willmer's Queen Adelaide, Sharp's Wellington, Wilson's Fanny Irby, Gidden's Miss Hennell, Jessop's Sir W. Middleton, Gidden's Teaser, Barraud's Bordene, and Hupton's Charlotte.—The *Middle Silver Medal* to Mr. Keynes, of Salisbury, for Gidden's Miss Hennell, Wain's Victoria, Sharp's Hector, Orson's Adelaide, Crask's Victoria, Wildman's Isabella, Hupton's Charlotte, Barraud's Cornelius, Wilson's Pluperfect, Green's Queen, Nulli Secundus, and Sharp's Wellington.—For Heartsease, in stands of 36 varieties, Mr. Brown, of Slough—the *Middle Silver Medal*. This stand contained Hannibal, Viceroy, Hale's Dark, Maid of the Mill, Orlando, Bella, Fair Maid, Warrior, Eclipse, Enchantress, Mulberry Superb, Duke of Beaufort, Cotherstone, Attila, Black Prince, William Tell, Chevalier, Alicia, The Prior, Plenipo, Venus, Duchess of Richmond, and 14 seedlings. Mr. Brown also exhibited a stand of 18 varieties of Dahlias, in very fine condition:—The Beauty of the Plain, Brown's Blue Bonnet, Standard of Perfection, Essex Triumph, Brown's Lady St. Maur, Sir R. Sale, Miranda, Springfield Rival, Dodd's Prince of Wales, Perpetual Grand, Bedford Surprise, Mrs. Shelley, Rembrandt, Brown's Delight, Indispensable, Phœnix, Union, Tournament, and Queen of the Isles.

SEEDLING.—For the best white ground Picotee, the *Small Silver Medal* was voted to the Rev. A. H. Matthews, for a seedling named Enchantress; and a similar reward to Mr. Norman, of Woolwich, for the best seedling Carnation. Seedling Heartsease recommended for a Prize, from Mr. G. King.

Of FRUIT, among *Gentlemen's Gardeners* for the best collection of four sorts, the *Large Silver Medal* was awarded to Mr. Hamp, who also obtained the first prize for Grapes.—The award for the four best sorts in the Nurserymen's class, was given to Mr. Bursill, and Mr. Chapman obtained a *Middle Silver Medal* for good specimens of Black Hamburgh Grapes. Of VEGETABLES the best were shown by Mr. Gaines, and Mr. Atterton.

Reviews.

The Scientific Phenomena of Domestic Life. By C. F. Gower, Esq. 12mo. Ridgway.

THE plan of this trifle is excellent. The Author explains, in familiar language, the true causes of the common phenomena that meet us at every step, and are therefore overlooked. If written by men acquainted with the subject, such books are invaluable, and that Mr. Gower is well acquainted with them, the following extract will abundantly show:—

"The current of air and smoke which ascends the chimney, is again an object to attract our attention—caused by the same expansive power of heat. The air, as it passes through and over the fire, becomes greatly increased in bulk, and consequently lighter; that is, a gallon of air expanded to double its bulk, or two gallons, will weigh only as much as it did before it was so increased, which causes it to ascend through the denser part, leaving its space to be filled by cold air from the door or window. By this means the fire is supplied with the proportion of fresh air necessary for combustion, whilst a considerable quantity of rarified air ascends the chimney, carrying up with it the smoke or dense vapour which arises from burning bodies.

"It may be inquired how it is that, when a fire is lighted in a room, the air does not descend the chimney to supply it, because that appears the easiest access to the outside air; and this, if the chimney were very large and quite open above, so as to admit space enough for an ascending and descending current, might be the case. To obviate this, if the chimney is large, we contract the opening at top, by putting on a chimney-pot, by which means the current of ascending air is rendered so strong through the small aperture as to prevent the external air from entering. We are very frequently disturbed by smoke coming into our rooms, particularly at first lighting a fire, and more especially when other fires in the house have been burning some time previously. When this is the case it will occasion a downward current of air in the chimney, caused by the other fires requiring a supply of air; and the open chimney being the easiest way by which the air can find admittance, this occasions the chimney to smoke when the fire is first lighted; but if the door of the room is closed and a slight portion of the window opened, the room is cut off from communication with the other fires, and the smoke will then ascend the chimney. When the fire is sufficiently established to cause a good draft, the window may be again closed, and the door opened without further annoyance, because the air to feed the other fires in the house will no longer find this chimney the easiest way of introduction, and some other means of entrance will probably soon discover itself. Sudden gusts of wind are apt to cause chimneys to smoke, by removing the equality of the atmospheric pressure on the outside, whilst the interior pressure is not exactly subject to the same influence. During the gust, the perpendicular pressure of the atmosphere above is partly removed by the velocity with which it passes over, in the same manner that the pressure or weight of a cannon-ball is removed from the earth while it is flying along, its velocity having overcome its gravity or weight; but when it loses its velocity, its weight again becomes perceptible, and it falls to the ground; the consequence is, that during the time of the gust, whilst the pressure is removed, there is a rapid draft up the chimney, caused by the want of resistance above; but the moment the wind lulls again, this pressure returns, the upward draft is suddenly checked, which causes a momentary obstacle to the ascending current, and a puff of smoke in the room is the most probable result. Some particular direction of wind will generally influence a chimney in this way more than another, either from some peculiarity in the situation of the chimney above, or from the apartment being more or less immediately influenced by the same cause; for, it is clear, if the variation of pressure above and in the room is simultaneous, no confusion will take place, but if the one happens a few seconds after the other, a contrary effect will be produced."

We heartily commend this little work to all our young friends.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

LÆLIA MAJALIS. The May-flower Lælia. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—The history of this charming plant is so well given by Mr. Bateman, that we beg to extract it from his magnificent work on the Orchidaceæ of Mexico and Guatemala. "This lovely plant abounds in the most temperate parts of Mexico, where its exquisite beauty has rendered it a prime favourite with the natives, from whom it has received the familiar appellation of 'Flor de Mayo.' It does not, however, appear to have been long known to botanists, Dr. Schiede having been the first to send specimens to Europe, which, through the liberality of Professor Schlechtendahl have been extensively distributed. Living plants were first obtained by Mr. Barker, from Oaxaca, through the instrumentality of Mr. Ross: and more recently, a large supply has been received by the Horticultural Society of London, collected by Mr. Hartweg in San Bartolo, in situations so elevated, that the temperature sometimes falls below the freezing point. This habitat, so unusual for an Orchidaceous plant, will go far to explain the ill success that has hitherto attended its cultivation, for while it is comparatively easy to imitate the close and humid atmosphere in which most of the tribe are found, it is infinitely more difficult to provide a substitute for the pure air and frequent changes of temperature in which these mountain epiphytes would seem to delight. Indeed, so signal, in the case of Lælia majalis, has been the failure of even the most experienced cultivators, that although there was scarce a collection that did not contain one or more specimens of the plant, still did it obstinately refuse to flower, except in the solitary instance about to be described, when it yielded to the skilful treatment of Mr. Dillwyn Llewelyn, of Penllergare, who has favoured us with the following note:—'This plant was purchased,' says Mr. Llewelyn, 'about three years since from M. Deschamps, and soon afterwards potted in very rough fibrous peat, being kept nearly dry in a cool plant house, until its new buds began to swell, when it was removed to a hot and damp stove, kept exclusively for Orchidaceæ. Water was regularly given until its buds had acquired their full size, when it was discontinued by degrees, and the plant carried back to a lower temperature. This treatment has been repeated, and under it the entire genus seems to thrive, although, perhaps, from the vigour of some specimens of L. anceps and L. autumnalis, which I have attached to pieces of rough barked wood (with a little peat tied round the root), I should prefer that course of treatment to the more usual one of potting them.' The mode pursued by Mr. Llewelyn is certainly the only one under which success can be expected; but there is yet a point to be gained, for while the specimens at Penllergare, however beautiful, consisted of only a solitary flower, in a wild state, three or four are borne upon a spike." The method of managing the plant in the Gardens of the Horticultural Society is as follows:—It is tied to a block of wood and suspended to a rafter in a moist stove. When removed from one block to another, which is sometimes necessary, it will be found beneficial to place a slice of turfy peat or a small quantity of sphagnum between the wood and the roots of the plant; this retains moisture in summer, so that less syringing is required. The quantity of water necessary for it on the bare block of wood would prove injurious to plants in pots below it. In the growing season the temperature does not exceed 80° by day, nor does it fall below 70° at night. In winter 56° with fire-heat is quite sufficient.—*Botanical Register.*

Miscellaneous.

Myrrh and Frankincense.—Major Harris describes the Myrrh-tree (Balsamodendron Myrrha) as growing abundantly on the Abyssinian coast of the Red Sea to the Straits of Bab el Mandeb, over all the barren hill-sides of the low zone inhabited by the Danakil or Adaiel tribes. It is called Kurbeta, and there exist two varieties; one producing the better description of the gum being a dwarf shrub, with deeply serrated crisp leaves of a dull green; while the other, which yields a substance more like balm than myrrh, attains a height of ten feet, and has bright,

shining, slightly-dentated leaves. The myrrh, called Hofali, flows freely from any wound, in the form of a milky juice, possessing a perceptible acidity, which either evaporates or becomes chemically changed during the formation of the gum. The seasons for collecting it are in January, when the buds appear after the first rain; and in March, when the seeds are ripe. Every passer-by transfers such portions of it as he may find to the hollow boss of his shield, and exchanges it for a handful of Tobacco with the next slave-dealer whom he meets on the caravan-route. The merchants also of the sea-coast, before returning from Abyssinia, send into the forests that gird the western bank of the river Hawash, and bring away considerable quantities of the Hofali, which is sold at a high price. The natives administer it to their horses in cases of fatigue and exhaustion. The shrub which produces the balm of Mecca (Balsamodendron Opobalsamum), is found on the opposite Arabian coast at Cape Aden, where it is called Beshán, either the original of or a derivative from the word Balsam. It is the Balessan of Bruce, who did not meet with the true Myrrh-tree. The balm flows copiously from any incision, and the ethereal oil speedily evaporating, a tasteless gum remains. The Frankincense, Major Harris states, is found chiefly along the Somauli coast, in the neighbourhood of Cape Guardafui. At Bunder Maryah, 20 miles to the S.W. of Ras Feeluk, the mountains are three miles from the shore, and attain a height of 5000 feet. Ascending 1000 feet, a plain presents itself, bounded on every side by precipitous mountains, studded with the Frankincense and Gum-Acacia-trees, although looking bare, from the total absence of underwood. The Frankincense-trees invariably grow from the bare and smooth sides of the white marble rocks, or from isolated blocks of the same scattered over the plain, without any soil whatever. From the base of the trunk, and about treble its diameter, a round thick substance is thrown out, of a nature between bark and wood, adhering most firmly to the stone, and resembling at a distance a mixture of mortar and lime. The stem rises from the centre of this mass, and having first taken a bend outwards of several inches, rises straight to a height of 40 feet. It throws out from the top short branches covered with a very bright green foliage, the leaves being narrow and rounded at the end, five or six inches in length by one broad, and crimped like the frill of a shirt, or rather like the sea-weed called by children on the English coast "the old gentleman's ruffles." The usual girth of the stem is from a foot to eighteen inches. The bark is perfectly smooth and consists of four distinct layers, the outermost of which is very thin; the two next of a singularly fine texture, resembling oiled letter-paper, perfectly transparent, of a beautiful amber colour, and used by the Somaulis to write upon; and the innermost about an inch thick, of a dull reddish hue, tough, and not unlike leather, but yielding a strong aromatic perfume. The wood is white and soft. On making a deep incision into the inner rind, the gum exudes profusely, of the colour and consistence of milk, but hardening into a mass by exposure to the air. The young trees produce the best and most valuable gum, the older merely yielding a clear, glutinous fluid resembling copal varnish, and exhaling a strong resinous odour. During the S.W. monsoon the pastoral tribes in the neighbourhood of Ras Feeluk collect large quantities of frankincense, which they barter with the Indian Banyans, of whom a few reside at the villages along the Abyssinian coast. Boats from Maculla, and from other parts of the Arabian coast also, come across during the fine season, and carry away the gums that have been accumulated, in exchange for a coarse kind of cotton cloth which is worn by the shepherds.—*Annals of Natural History.*

Horticulture of Auckland in New Zealand.—No country in the world seems to be better adapted to Horticulture than New Zealand: the alternations of shower and sunshine that characterise the climate for a great part of the year, cause a most surprising vegetation. All the common fruits and vegetables of Europe flourish in great perfection, and some of the southern climates grow vigorously in the open air. *Fruits.*—There are planted at present in this district, Peaches, Nectarines, Apricots, Almonds, Figs, Lemons, Oranges, Olives, Vines, Plums, Cherries, Mulberries, Pears, Apples, Quinces, Walnuts, Filberts, and the Loquat (Mespilus Japonica). These are all in a healthy state, and many give promise of fruit this season. It is doubtful if the Orange will ripen its fruit, or the Olive, both of which however are in a thriving condition. The Vine plants brought from Sydney in October, 1840, have already produced Grapes, and others procured from different sources, and planted subsequently in gardens, have thriven surprisingly. The cultivation of the Vine on a large scale is a subject that might be enlarged upon, but as it is expensive, and the return tardy, it is not likely to be attended to in the infancy of a colony, but it should not be lost sight of, and it is to be hoped that some enterprising and competent person may yet undertake it, for there can be no doubt that the volcanic lands in this vicinity are well adapted for vineyards, and that good wine might be made from their produce. The Gooseberry, red and black Currant, have been planted, but it is probable that the climate of this district is not adapted to them, as a long continued high temperature would seem to be unsuited to their habits; being natives of northern climates, they do not thrive, but probably means may be found to cultivate these national fruits. The same may be said of the Raspberry, unless planted in a very moist and shady situation. The Strawberry has afforded fine crops in some gardens, but the soil in general appears unsuitable: they generally run too much to leaf. The Cape Gooseberry (physalis edulis) is almost indigenous, growing wild in every part of the country, but if cultivated in gardens and trained, would grow to a greater size, and prove a valuable fruit for domestic purposes. It bears nearly throughout the year. Melons of several varieties have been grown in the open air: though late in coming to maturity, they were of delicious flavour. *Culinary Vegetables*—The common culinary vegetables of Europe grow in this district in a manner that cannot be surpassed, but much judgment is required in selecting the period for sowing and planting. It may be stated as a general rule, that no seed need be planted in the months of January and February, as the dryness of the season and the attacks of the insects will render the labour futile. The results of the experience of three years are now furnished. Beans may be sown in May and June: when a foot high, it is best to cut them down close to the ground; they will then flower in September, and produce plentifully; if again cut down, they will bear again: they seem to be biennial in this climate. Kidney Beans may be sown from September to November: they bear plentifully, and a species (haricot blanc of the French) produces abundantly, and might be used in their dried state with advantage, as in the south of Europe, in soups and stews: they are very nourishing and palatable. The scarlet runner does not generally succeed well, but a species, the Lima pole Bean, introduced from South America, grows well in a rich soil and in a sheltered situation, and is a very delicious vegetable, being used as the broad bean. Carrots may be sown from April to September, but not later; they grow to a very large size. The Potato Onion, which thrives admirably, ought to be planted in June. A species of Eschalot, which has almost become indigenous, being cultivated largely by the natives, grows throughout the year. *Flowers.*—It would be tedious to enumerate the variety of flowers that flourish in this district. It may suffice to say, that in addition to those cultivated in the open air in Great Britain, many grow here throughout the year, which there require the protection of a greenhouse.—*Extracts from The Southern Cross, and New Zealand Guardian, Nov.* 25, 1843.

Carnation and Picotee Show.—As the day is fast approaching (the 6th of August) when the Carnation and Picotee Show, open to all England, will take place at the Coppice, near this town, in the grounds of Mr. J. F. Wood, nurseryman and florist, for two silver cups, value five guineas each, presented by him for competition, we are enabled by the kindness of the Secretary to the Committee, Mr. G. J. Robinson, to present to our readers a list of the competitors, amongst whom are some of the best growers in the kingdom:—

Carnation Cup.

Mr. S. Pollard, Ilkeston
Mr. E. Hirst, Caunton, near Newark
Mr. T. Hastings, Oxford
Mr. J. Gibbens, Bramcote,
Mr. W. Hepton, York
Mr. J. Oldham, Beeston
Mr. J. Haines, Tipton, Warwickshire
Mr. R. Orson, Grantham
Mr. I. Taylor, Snenton
Mr. I. Hepworth, Halifax
Mr. W. Lodge, Manchester
Mr. R. Rilot, Donington, Lincolnshire
Mr. G. Hudson, Kingstone
Mr. J. Smalley, Leicester
Mr. W. Sharpe, Clophill
Mr. G. Pickering, Nottingham

Picotee Cup.

Rev. A. Matthews, Oxford
Mr. E. Hirst, Caunton, near Newark
Mr. J. Gibbens, Bramcote, Nottinghamshire
Mr. W. Pearson, Nottingham
Mr. W. Hepton, York
Mr. J. Oldham, Beeston
Mr. J. Haines, Tipton
Mr. R. Orston, Grantham
Mr. J. Hepworth, Halifax, Yorkshire
Mr. W. Lodge, Manchester
Mr. R. Rilot, Donington, Lincolnshire
Mr. G. Hudson, Kingstone
Mr. I Ward, Nottingham
Mr. J. Smalley, Leicester
Mr. W. Sharpe, Clophil
Mr. S. Buswell, Nottingham.

Observations on the Green Teas of Commerce, by Robert Warington, Esq.—On submitting a sample of Green Tea, supposed to be spurious, and which had been seized by the Excise, to microscopic investigation, the author found that the variation of tints, which had led him to this mode of examination, was dependent on adventitious substances mechanically attached or dusted on the surface of the curled leaves. The principal part of this powder was of a white colour, interspersed with particles of an Orange and of a bright blue. From the abraded dust of this sample, obtained by agitation, some of the latter were separated, and proved on examination to be Prussian-blue; the Orange portion was apparently some vegetable colour; and the white and principal part was found to contain silica, alumina, a little lime and magnesia, and was probably kaolin or powdered agalmatolite, more particularly from the rubbed and prominent parts of the Tea assuming a polished appearance. A great variety of other samples of Teas were submitted to examination, but in all cases they were found to be faced with various substances, to give them the bloom and colour which is so distinct a characteristic of the Green Teas of commerce. The unglazed varieties appear to have had no blueing material applied. Very high qualities of glazed Teas have this facing apparently tinted of an uniform pale blue before application; while others, still of high quality, and embracing the great part of the samples examined, have both the white and blue particles very distinct, the latter varying in its quantity; in the low qualities, as Twankay, being pretty thickly powdered. When this facing was removed, the Tea was found to be of a black colour, but without the corrugated aspect presented by black Teas ordinarily, and which evidently arises from the higher temperature to which they are subjected during the process of curing or drying. The substances separated from these Green Teas were sulphate of lime, a material analogous to kaolin, and Prussian-blue, together with some yellow vegetable colouring body. It is evident that the whole of these Teas come to this country in a dressed or adulterated state, and the *onus* of this should fall on the right shoulders. The author concluded by quoting various opinions and observations of persons long resident in China, by which his investigations are satisfactorily confirmed.—*Chemical Gazette.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

About the beginning of August some of the best gardeners treat their established stove plants somewhat like those of the greenhouse for five or six weeks. They either remove the plants to more open houses or throw their stoves open on purpose—removing dwarf, tender, and young, delicate plants into close frames. Whatever conveniences of this nature may be at hand should be made the most of at this time. Nothing can be more injurious to stove plants than keeping them growing late in the season, and thus preventing the ripening of their wood, which renders them more liable to injuries in winter and prevents their flowering freely next season.

Conservatory.—Concerning the varieties of Thunbergia alata, being among the best things for the conservatory at this time, and coming more into fashion every season, I shall again offer suggestions for their management, as some find them difficult to manage. A complete key to the natural or true management of these plants is given in last Number (p. 483), in the notice of Mr. Backhouse's volume. Mr. B. says they grow in shady places, "much in the manner that Ground Ivy grows in England." From this we may infer that the back borders, or under the large specimens planted out in the conservatory, is the true situation for these plants, where they might scramble among Ferns, roots, or Moss, stones, &c., "after the manner of Ground Ivy." But to improve, or rather to follow out the great improvement which Mr. Fryer has effected, they ought to be planted out in pits early in May, using very rich rough compost, and placing fresh Moss all over the bed; keep the Moss damp and shade the plants in the middle of the day, and allow them run all over the Moss. Beautiful as Mr. Fryer's two new seedlings are, I have no doubt but still greater beauties may easily be obtained from plants thus treated.

Pits and Frames.—The lights should now be drawn off at night, where the plants are of the hardier kinds. Stout cuttings of Plumbago capensis struck now will force next spring for the conservatory, and may afterwards be planted out in beds in the flower-garden, for which they are admirably suited.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

We have not had such alternations of wet, cold, and dry seasons for flower-gardening for the last five years, which, if they have taught us nothing else, have convinced me of the impossibility of producing anything like vigorous growth in bedded-out plants by manual labour, let it be ever so well directed. There is certainly a great difference in soils, and plants will grow in one of a free porous nature when they can scarcely exist in one of an opposite mechanical texture; but even under the most favourable circumstances of soil and situation, it is impossible to produce a healthy growth during the prevalence of north or north-east winds, which seem to prevail here during the spring and early summer months, with as much exactness as the trade winds do in more tropical climates. Two of the flower-gardens here were attended during the past dry weather with all the care which the most solicitous could have bestowed upon them. They were regularly watered with warm soft pond water, wetting the soil each time to the depth of at least nine inches; the beds were mulched with short Grass, and the plants shaded in the day time, but with all this they did not grow; under ones became sickly, and those not well established at the time of turning out died outright. Therefore, What is to be done another season? I direct this question to the flower-gardeners of the United Kingdom, knowing that in the multitude of counsel there is wisdom, and with the hope that many will be induced to communicate their answer to the query. At the same time I should also be glad of a list of such plants as are considered by the growers novelties in the way of bedding-out plants, and more particularly if any are grown which were not mentioned in the Amateur's Garden in the *Chronicle* of last year. I shall next week answer the question, What is to be done? and then proceed weekly with the lists of the best grouping plants. —*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas and Polyanthuses—Must at this season be kept from excessive rain, and above all things avoid a continuous drip. Nothing ruins an Auricula so soon as wet lodging in the crown or heart. The Aphis must be sedulously attended to and never allowed to get a-head. Tulip-seed continues to ripen: secure the heads as soon as the seed-vessel opens at the top, or the stalk becomes dead; put them in paper bags and hang them up in a dry place. *Carnations.*—The blooms come on very rapidly, more so than we ever previously recollect. Pollen appears more abundant this year than usual; we have impregnated many blooms this season, always observing to have the bloom operated on, of a good sort and of good colour, and the variety from which the farina is taken as good as we can get it. Continue to layer; a great deal of the success of wintering Carnations well depends on having strong and early-rooted layers, that they may be well established in their pots before autumn. Some varieties are blooming better than usual this season. Colen's Juba, for instance, a beautiful shaped flower which usually comes short of bizarre, is this season quite up to the mark, whilst the accounts I receive of Colcut's Brutus confirm me in the opinion I entertained of it some years ago, namely, that it is an extremely coarse flower as well as uncertain. *Ranunculuses.*—Sad complaints are made from all quarters of the great loss of roots, many collections being nearly destroyed. Seed may now be gathered, as the heads assume a yellow hue.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries—It is a desirable point in the cultivation of the Pine-Apple, that no check should be given to the plants, from the commencement of their growth till the fruit is ripe. Notwithstanding this, there are few gardeners who have not at some period or other been compelled to check some of their plants, by withholding water, to cause them to fruit sooner than they otherwise would do; thus obtaining fruit at the time that it is most required, at a sacrifice of size. This is sometimes the case in large establishments, where a regular supply is wanted all the year round. The leaves should not be allowed to become flaccid, nor the bottom heat to decline. Occasional sprinklings with the syringe should be given, and as soon as you feel certain that the fruit is formed, and beginning to rise from the heart of the plant, give liquid manure in small quantities, and in a clear state, until the plant is quite recovered; when it may be watered and treated in the usual way. Attend to the growth of the suckers, so as to get them well rooted before winter. Shade them in hot sunshine.

Vineries.—Look over the bunches to see if there are any injured or small Berries in them, which remove as you go on. The return of dry hot weather is favourable to the increase of red spider; be assiduous in the use of the usual means for checking it. It is easily kept down or eradicated by the syringe where the fruit is all cut. Look to the state of your borders with regard to moisture, where the Vines are swelling their crop. If they are dry, supply plentifully with liquid manure, first loosening the surface with a fork, 1 inch deep, to prevent the water from running off.

Peach houses.—The houses which contain fruit should be kept well ventilated at all times. When the weather is fine, it is not necessary to shut up the houses wholly at night, unless it is wished to hasten the ripening of a crop. Keep all Peach and Nectarine-trees clear of insects, and supply with water regularly as required.

Strawberries.—Continue to lay the runners of the kinds you wish to force in pots, till you have a sufficient quantity done. Let those already laid have plenty of water.

Melons.—(see last week's Calendar.)—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Apricots.—As soon as the fruit changes colour, keep a sharp look-out for snails and woodlice. To keep the first in check, where they are numerous, syringe repeatedly with clear lime-water, not doing it too late, as otherwise a thin pellicle of chalk would be formed, and spoil the look of the fruit. Lettuce-leaves, &c., may be strewed about the wall, after being greased on one side, and examined every morning. The syringing will also discompose the woodlice, as they do not like wet, and cut stalks of Beans may be inserted in the branches of the trees as traps; but the great remedy is to keep the wall in good order, so as to give them no place for concealment. The following circumstance might furnish a hint:—A month ago they annoyed me by taking absolute possession of a Mushroom-bed in a bearing state. I had the covering removed, swept the bed, syringed the walls, killed as many as I could, and run a brush with gas-tar all round the bed. The smell was very offensive for a day or two, but scarcely a woodlouse has been seen since. *Peaches.*—These very hot days are just the delight of the red spider, and if he once establishes his colonies on the underside of the leaves, he will smile secure for a time amid all the battering from your garden-engine. Put plenty of sulphur in the engine, previously made into a paste, so that it mixes equally with the water; or what is better, take Mr. Errington's advice, and daub the open spaces of your wall with it, and then the more intense the heat the stronger the fumes of the sulphur will be. It is as yet the only remedy we possess for expelling or killing the red spider, and I have never known vegetation suffer from its fumes, unless when heated to ignition. *Mushrooms.*—The chief thing to be attended to with beds in a bearing state, is to keep them in a close cool atmosphere, by frequent gentle sprinklings of water on the slight coverings of the beds. Take every opportunity that occurs of collecting and drying horse-droppings, &c., for future beds. *Routine.*—Sow Cabbage for the spring crop, Lettuce and Endive for succession, the last French Beans for the open air, a good breadth of Turnips, Radishes, Onions, &c., for Salads, and Flander's Spinach now, and again in eight days, for early winter use.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Attend to the directions given in recent Calendars. Examine the woods often in order to ascertain what trees may be taken out next season.

Coppice.—As the young shoots from the stools are growing fast, great attention should be paid to thinning and regulating them before high winds, accompanied by heavy rain, occur, which often does much injury to them.

Young Plantations.—Attend to shortening and training the young shoots according to previous directions. By this practice the trees make more progress than those left undone.

Nursery Work.—Attend during the growing season, to thin, shorten, and train the young shoots, if strong handsome plants for speedy removal are wanted.—*W. B.*

VII.—COTTAGERS' GARDENS.

Look over Vines on walls to stop laterals, thin out weak shoots, and keep the rest neatly fastened in. The fruit will now be advancing, and the bunches should be thinned out with a pair of scissors, which is an operation that is very essential to their perfection both in size and flavour. Keep Dahlias tied in; remove weak side-shoots and give them occasionally a watering with manure water; if they are planted in a situation and soil which render mulching necessary, cover the dung over with a thin layer of soil, which will take away its unsightly appearance. Keep Creepers (if any) on the cottage walls neatly trained up, but not so as to give them too stiff or formal an appearance; free them from all dead leaves. It is of great advantage to Cucumbers that are planted in the open air, to cover the ridges with clean Straw or Pea-haulm, before the plants are too far advanced. This keeps the sun from parching the ground in hot dry weather, and prevents the blossoms and young fruit from being covered with soil during heavy rains; it also, in a great measure, preserves the fruit from becoming spotted, when the autumn is wet and cold. Towards the end of the week, prepare a small bed and make a sowing of Early York and Vanack Cabbages, to come into use in spring. Thin out young Turnips as they advance; hoe between the rows of growing crops, and keep down weeds.—*J. M'H.*

State of the Weather near London for the week ending July 25, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 28th July, 1835—therm. 91°; and the lowest on the 1st Aug., 1842—therm. 43°.

Notices to Correspondents.

Bokhara Clover.—*A Constant Reader.*—This is a coarse annual stemmed plant, growing 7 or 8 feet high. Alcohol, when decomposed, may be useful to plants; undecomposed, it must be injurious.

Country Shows.—*John Sillobs*, or *Snobs*, or *S. Shobs*, or *Schobs*, (for we cannot read your signature,) you do not say *what* Show your report belongs to. What Society is "this Society?"

Currants.—*F. X. O.*—The origin of the Black Naples Currant is unknown to us. It has existed in the Garden of the Horticultural Society since 1824, when it was obtained from the Nursery of Messrs. Dickson, of Edinburgh.‡

Diseases.—*J. B.*—Certainly, where the flower-buds of shrubs produce nothing but leaves it is a disease, caused by an excessive supply of food. We should like to know how the ingenious gentlemen who set up against Morphology can explain such things without reference to its principles.

Flower Shows.—*An old Subscriber.*—Common sense says that the words "That no flower, &c., being burst, artificially supported, or otherwise imperfect, be entitled to take a prize," applies to Carnations, and plants of that sort. If it is maintained that it applies to Moss used in forming a ground for Roses, the decision must be arrived at by some other sense than common sense.

Heating.—*A Subscriber.*—We do not sell heating apparatus. Consult the advertisers. Yours is a very little affair, and hardly fit for an apparatus. Consult the paper by "Dion," at p. 316, vol. 1844, and try to make an apparatus for yourself; if you are a clever man you can easily do it.

Heaths.—*A Reader.*—The following are good kinds, which bloom throughout the summer:—Ewerana, tubiflora, vestita coccinea, v rosea, sulphurea, Hartnelli, tricolor, ampullacea eximia, echiiflora, Bowiana, mammosa, viridiflora, Irbyana, refulgens, retorta, perspicua, Massoni, exsurgens, Aitoniana, depressa, Cavendishii, and the several varieties of Ventricosa. For Camellias, see p. 431 of this year.‡

Humphreys's Soluble Compound.—We have received from Mr. Humphreys another letter, which commences in the following words:—"As it is now obvious that the object of the late attacks on this subject has been to injure the sale, *by the fabrication of fictitious chemical details* as to its nature," &c. This language, which is as false as it is offensive, at once excludes the writer from a future place in this Journal, except in the advertising columns. Our object has been truth, and that we have gained. Our business is to enlighten the public, and that we have done. We have shown that the so-called Compound is nitrate of ammonia, with some trifling impurities, and a mere trace of phosphoric acid; and we have thus enabled gardeners to judge of its real value. Mr. H. was greatly mistaken if he thought that we were to be driven from such a course by either fear or favour.

Hybrids.—*Clericus.*—The greater part of the Fuchsias in cultivation are mules, and barren. If you want pollen you must go to the original species, or you must examine your mules till you find good pollen. The pure parents are the best to use, at least on one side or the other. Without pollen you cannot cross. Let your Dahlias alone; the side-shoots will grow in heat, but will do no good now.

Insects.—*F. H. S.*—Your Caterpillars will change to the Vapourer Moth, Orgyia antiqua, described and figured in the *Gard. Chron.* vol. ii. p. 540; they feed on a variety of plants, and occasionally do great mischief in the squares of London. Nothing but hand-picking and destroying the apterous females and the clusters of eggs can afford you any relief. *R.*—*A Subscriber.*—If your query was not answered your letter never came to hand. The maggots infesting your Cauliflowers, &c. will produce a Fly, probably the Anthomyia ceparum, whose history was given in vol. i. p. 396 of this Journal, and you must consult the "Royal Agricultural Journal," vol. iv. p. 128, where the best mode of extirpation is recorded. *R.*—*J. Butterfield.*—Your luminous animals are female Glow-worms. *R.*—*J. M.*—The Slug worms infesting your Pear-leaves are the larva of a Saw-fly, named by Linnæus Ten hredo cerasi, whose history you will find in the 2nd vol. of the *Gard. Chron.*, p. 692. *R.*—*A. B.* Thanks for your notes and supply of infested Barley. *R.*—*A Constant Reader.*—Your Pear-tree leaves have been eaten by the larvæ of a Moth called Argyromiges Clerckella, which is figured in the 1st vol. of the *Gard. Chron.*, p. 261, where its history is given, and the best means of getting rid of the disease. Whether your Ribstone Pippin be affected by the same Caterpillar we cannot determine without seeing the leaves; the Pelargonium spots arise from a very different cause. *R.*—*A Subscriber, Waterford.*—It is impossible to advise you in the absence of specimens of the insects, and a portion at least of an infested leaf. *R.*—*Aliquis.*—We believe your Shells are the Helix memoralis, but they are so mutilated that it is difficult to determine the species. *R.*—*R. W.*—Your Oak gall will produce the Cynips gemmæ. *R.*—*A Constant Reader in the North.*—Please to send us some of the black scales affecting your Vines, and we will tell you what is best to be done, for as the females are stationary, and the young ones scarcely visible, we think you must be mistaken in supposing they come out of the earth. *R.*—*N. O. P.*—We should be happy to comply with your request, but the Caterpillar was crushed perfectly flat. Lucifer boxes are no protection by post, but if you will send us a Caterpillar or two in a shallow pill-box with a piece of cork stuck in the centre, we shall feel obliged, as this enemy to the Carnations is an interesting and novel fact which we are desirous of investigating. *R.*

Morphology.—*J. S.*—We would strongly advise you to turn your attention to things you understand. We really cannot inflict your ignorance upon our readers.

Manures.—*C. J. P.*—We have had no experience with horn-dust, and therefore cannot give an opinion respecting it.‡

Names of Fruit.—*A Constant Reader.*—Your Pear is the Citron des Carmes.‖

Names of Plants.—*L.*—Tropæolum pentaphyllum.—*A.B.C.*—Certainly not Clerodendron splendens, nor at all like it.

Oaks.—*A North Briton.*—The cause of the disease of your Oaks could only be determined by personal inspection. It is impracticable to say what is the matter without that.

Pelargoniums.—*A.*—Turn them out of doors for a fortnight to ripen the wood, then cut them back, both top and bottom, shake them out of their pots, and repot in fresh soil.

Pot Pourri.—*J. B.*—The following receipt is excellent:—Put into a large China jar the following ingredients, in layers, with salt strewed between the layers: two pecks of Roses, part in buds and part blown, Violets, Orange-flowers, Jasmine, and anything sweet—a handful each; Orris root, sliced, Benjamin, and Storax, 2 oz. of each; ½ oz. of Musk, ½ lb. of Angelica-root, sliced, a quart of the red parts of Clove-Gilyflowers, two handfuls of Lavender-flowers, half a handful of Rosemary-flowers, Bay and Laurel leaves, half a handful each; also of Knotted Marjoram, and Balm of Gilead. Cover them quite close; when the lid is removed the perfume is very fine. When the above has been in the jar some weeks it is advisable to empty it entirely, stir it well with the hand, and return it into the jar again.

Preserving Skins.—*J. M. C.*—You must consult a work on Taxidermy; we cannot give up space to such a subject as bird-stuffing. The booksellers will readily set you up.

Raspberries.—*Messrs. Youell and Co.*—The samples of Fastolff Raspberries which you have sent are fine, large, good-looking fruit.‡

Royal Botanic Garden, Regent's Park.—*Scrutator.*—This time you are probably right. It may be true that one of the Judges of Roses at the last meeting was also an exhibitor, and assisted in giving the first prize to himself; and if true it did his good taste no great credit, and it was decidedly wrong on the part of the Regent's Park Society to have made him a Judge. But, supposing this to have happened, there can be no doubt that the Managers of the Regent's Park Garden will take care to avoid in future such an oversight as making a Rose Exhibitor a Rose Judge. If it should again happen, it will then be time to attack the Society on the subject; but not till then.

Soils.—*U. J.*—By all means mix Guano with farmyard dung, but mind that it is not allowed to become wet and then drain away. It may become wet, if you like, but the drainage must be all thrown back again. We should dig it in early next spring. We never before heard of a "lug" of ground. How much is that? Move your Apple trees on the 1st of November, or as near that day as you can.

Strawberries.—*S. B. P.*—To Keen's Seedling you may add Myatt's British Queen, Elton, Grove-End Scarlet, and Downton. We would prefer planting in rows, with three plants in each patch.‡

Miscellaneous.—*Enquirer.*—We really do not know what we *can* add to our own opinions upon planting and pruning, beyond what has been already stated in our columns for the last three years. It is an entangled subject, and you had better consult our previous volumes. If your plants are bushy-headed cut them down, except Beech, and watch with care the new shoots that will be thrown up. Thinning is the great thing; pruning we esteem but lightly, except in particular cases. Prune Laurels in April. Knight's Dwarf Marrow is the best late Pea. Employ Potter's guano, or superphosphate of lime; the last best. Why not let your Vines bear? There is no earthly reason against it. Mix urine with water, and when in full fermentation, add oil of vitriol carefully till effervescence ceases, or throw gypsum among it; or if you are prodigal leave it till it loses its causticity. It is the most valuable of all manures. Steep guano in it, and try it on Camellias.—*A Subscriber.*—After your Calceolarias have done flowering they may be placed out of doors in a shady situation until the young wood becomes sufficiently ripened for putting in cuttings of them. Allow your Achimenes to dry off, withholding water gradually until the stems become withered, when it may be stopped altogether. From your Pelargonium seed that has not been fertilised with other kinds, you have a chance of raising something different from the parent plant, as Pelargoniums are varieties, but seeds of your Fuchsias, if they are species, are likely to reproduce the same thing. We cannot tell where Meyer's rat poison can be had.‡—*S. E.*—We are not aware that there is any preparation first put on zinc labels to fit them for retaining the ink.—*A Reader.*—For information regarding gold fish, we would refer you to p. 213 of the present year.‡—*A Lady Gardener.*—We cannot recommend Nurserymen.‡—*A. J. B.*—You can have 27 of the Numbers you write for; the others are out of print.—*Rusticus.*—Skeletons of leaves are made by maceration in plain water till all the parts are soft, then washing and picking out the soft parts with needles, and then steeping for a little while in *very* weak muriatic acid. It is a difficult and tedious process. Gather the leaves when full grown.—*W. C.*—May add to his Conservatory climbers Hardenbergia macrophylla and Mandevilla suaveolens.‡—*Somerset.*—You had better allow your Raspberries to stand, and have patience until another year, when probably you will have suckers. We presume your Salvia is S. mexicana. To flower it, it should be grown in a pot, and should not have too much pot room, as it is apt to get over-luxuriant. It also requires to be freely exposed to bright light during the summer months.‡—*E. B.*—Two good Cabbages to be sown about this time for spring use are the Early York and Vanack. There is no evidence to show that the moon has the effect of causing or preventing them from running to seed. Ground for Onions should be bastard-trenched and ridged late in autumn, and manured at the same time. Nothing, therefore, is required when the seed is sown in spring but levelling down the ridges.‡—*J. A. A.*—The glow-worm is not destructive in flower-gardens. For its history, see page 443 of the present year.‡—*A Reader.*—Will find excellent directions respecting the management of Cape bulbs, given at p. 774, 1843.‡—*Hibernicus.*—For a method of trapping Weasels see p. 260 of this year. Let the weak side-shoots of your Dahlias be thinned out; they are not worth the trouble of putting in for cuttings, as Dahlias are so easily increased in spring.‡—*Chemical Jack.*—We are sorry, but cannot remedy the evil of which you complain. Speak to the agent who supplies you.—*J. H. H.*—Depend upon it the Vine you speak of was not a Vitis, nor its fruit Grapes of any kind. There is no such thing, as far as we know, as a herbaceous Vitis. There are plenty of Vine-like plants, herbaceous, and bearing berries; but what you may have seen we cannot tell; perhaps some Bryonia.—*Mede.*—We are unable to explain the first cause. There is no doubt that the curling in your pods of Stock arises from one side being injured and made incapable of growing as fast as the other. But what may have injured it and made it so we see no means of explaining.—*N. O. P.'s* question is not forgotten.—*Alnus.*—You will find all about Anastatica at p. 363, of 1842. The reference is omitted by some negligence of the person employed to make the Index. The seeds cannot be bought in this country. It has possibly been cultivated, but we never saw it.

SEEDLING FLOWERS.

Antirrhinum.—*Z. Z.*—If 29 is a seedling it must be a repetition of caryophyllicides. 30 is handsome and well formed. 33 is pretty, but not new, and the lower lip does not spread, as it does in 30, which is a very perfectly-formed flower.*

Fuchsias.—*W. J. E.*—We are obliged by the sight of your flowers; they are very good as a collection. 3, 9, and 10 are very fine.*—*E. T. S.*—The sepals of your seedling are too long; and there is nothing new in the colour to recommend it for general cultivation *—*W. R. and S.*—Your seedlings are large, stout, and showy flowers, but in colour they are similar to the varieties in cultivation; 2-44 is the best *—*Z. Z.*—A large, stout, and rather coarse flower, not differing in colour from a great many already out.*—*W. S.*—As a variety for bedding out, or planting in the border, your seedling No. 10 is an excellent variety; it appears to be a robust grower, and is the most prolific bloomer we have seen, bearing several flowers at every joint; the flowers are large, rich in colour, and measure, from the base of the footstalk to the end of the pistil, nearly six inches.*—*C. D. M.*—*No.* 1. The sepals to this variety are long and coarse, and there is scarcely any distinction in colour between the corolla and the rest of the flower. 2 is a better flower, elegant in form, but wanting the purple in the corolla: this is the best seedling. No. 3 is small, and though bright and pretty in colour, the proportions of the flower are not good.*—*Y. C.*—Your seedling is a showy variety; rosy carmine tube, with sepals tipped with green; the corolla purple crimson, and very large for the size of the flower.*

Petunias.—*D. J.*—Your seedling is a delicate and pretty variety, and the changes it undergoes after the flower opens, of a purple-crimson to various tints of blue, increases its value.*—*Z. Z.*—Your dark-veined Petunia is a pretty variety, but not very new or striking.*—*W. G.*—It is impossible to form an opinion of your seedling, from the flowers being pressed flat between paper; they were so bruised that the colour was entirely gone; they travel best in damp moss.*—*J. S. S.*—Seedling Petunia, rich purple crimson, spotted, and occasionally striped with white; the spots are distinct, but the flowers are rather small. We should like to see it again, in about a fortnight. It will make a good border variety.*

Pansies.—*W. J—n.*—Your Pansy is of no value, the flower not having a clear ground colour; this part of the flower is blurred and imperfect.*

Pelargoniums.—*R. W. and Co.*—*Formosissima* is your best seedling. The flower is well formed, but the top petals want smoothness; and though common in colour, it is delicate and pretty. *Teniers* was too far gone to form an opinion of; and *Rubens* and *Maid of the Valley* are ill-formed and destitute of novelty.*—*F. C. B.*—Your seedling scarlet is of a very rich and intense colour, and resembles in intensity a variety known as the Brighton Hero. The trusses are very large and compact; the one sent contains between 70 and 80 buds and flowers.*—*J. Y.*—The petals of your flower had fallen; they appear thin and deficient in substance, and the form of the flower we should judge to be too long; the top petals are rich in colour.*—*Eleanor.*—Your white seedling, No. 18, is a good flower, well formed; the spot decided and the white pure: it would have been more welcome with the spot any other colour. The top petals to 19 are too pointed, and the colour and surface too uneven; the lower petals are broad and clean, and the flower is good in substance.*—*W. H. Gr.*—Your flower is good in colour, but deficient both in substance and form as a show variety.*—*J. H.*—Your seedling is a flower of good form and substance, but it is unfortunately of that lilac colour which is now discarded from every good collection.*

Verbenas.—*Z. Z.*—There is nothing new or particularly attractive in either of your seedlings; they are similar in colour to varieties in cultivation.*

*** As usual, many communications have been received too late.

SEED-WHEAT.—Any one desirous of purchasing Seed for next year is invited to inspect the two varieties of Wheat, SHIRREFF'S HOPETOUN and MORTON'S RED-STRAW WHITE, 120 acres of which are now growing on WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE.

The present is the only season of the year when the value of any variety of Wheat as Seed can be ascertained by inspection; for, if the examination of a mere sample of the grain, which can be seen at any time, be nearly uninstructive as to its quality in the eye of the baker (see *Ag. Gazette*, No. 5), it is entirely so as to the productiveness or habit of growth of the variety to which it belongs. These points, which are of the highest importance in the eye of the Farmer, can be ascertained only by an examination of the growing plant when in full ear.

JOHN MORTON, Whitfield, Thornbury.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, July 31	Agricultural Society of England.	
THURSDAY, Aug 1	Agricultural Imp. Soc. of Ireland.	
WEDNESDAY, Aug. 7	Agricultural Society of England.	
THURSDAY, Aug. 8	Agricultural Imp. Soc. of Ireland.	

FARMERS' CLUBS.

July 30	Framlingham. Isle of Thanet. Rayleigh.	Aug. 3 Collumpton.

WE have to direct the attention of our readers to the Report, in other columns, of the MEETING OF THE AGRICULTURAL SOCIETY OF ENGLAND AT SOUTHAMPTON during the past week.

The exhibition of implements, to which, in keeping with our leading principles (see No. 1), we have devoted the greater part of our attention, has greatly surpassed its predecessors, not only in the money, but in the agricultural value of the machines shown. This Exhibition possesses not only a positive interest, depending on the usefulness of competition amongst machine-makers, but it possesses also a relative interest, to be ascertained by a comparison of it with those of previous years, inasmuch as it exhibits the progress of improvement in that important subject—agricultural mechanics. We have endeavoured to exhibit, by a comparative statement, the relation in which the show of implements at Southampton stands to that of the previous year at Derby. This will be seen, along with other remarks on the subject, in another place.

THOUGH the subject of Machines of Carriage will come to be considered more in detail in the course of a series of articles on Agricultural Mechanics, which we hope soon to lay before our readers, yet the present being a seasonable time for a discussion of THE MERITS OF THE CART OR WAGGON FOR HARVEST PURPOSES, we shall just state the points on which such a discussion must turn. Our own opinion is, that for these, as for most if not all farm purposes, the one-horse cart is the most economical machine in use; but the result of a well-conducted comparative trial might prove unfavourable to this view, and yet arable farmers who hold it might still be perfectly justified in refusing to use waggons instead of carts—and this, on the only ground which can commend itself to the practical man—on the ground of true economy. For, to take a case, we happen to know a farm on which, in winter and spring, 2100 cubic yards of manure were last year carted from the steading to the fields; on which, in autumn and winter, about 1400 tons of Swedes, Mangold Wurzel, Carrots, Potatoes, and Turnips, were carted from the fields to the steading; on which, in summer and autumn, about 700 cart-loads of Corn, Hay, and Stubble were carted home. Now, was it the interest of the farmer in this case to change his carts for waggons, though it might be proved that he would have saved by it in harvesting his 700 loads of Corn, when he would so manifestly have suffered by the change, with reference to five times as many loads of the less bulky material—manure and green crops? We do not suppose the experience of every or of many arable farmers is similar to that of the one we allude to, but we just mention the case, to convince those who hold the superiority of the waggon over the cart in harvest-time to be self-evident, that others may agree with them in opinion on this point, and yet reasonably differ from them in practice.

This farmer needs *all* his present number of carts when hauling manure in winter and spring. Is it his interest to purchase, in addition to them, as many waggons as he will require during Corn-harvest, merely to obtain the small differential advantage which we will suppose him to receive from them at that season? This advantage would need to be a great one to justify an affirmative answer. But we believe, where well-constructed carts are in use, the employment of waggons at harvest-time in their stead, in place of being advantageous, would entail a *loss* upon the farmer.

The implements and furniture of a farm form a large item in the account of capital invested in it, and the purchase of a greater variety than is necessary is obviously most unwise: the aim should be, not to have a machine for every separate purpose, but to get a machine to perform as many purposes as possible.

To no class of implements do remarks on variety being inconsistent with economy apply more than they do to machines of carriage. There are waggons for the carriage of heavy goods, and waggons for the harvesting of Corn or Hay; and there are three-horse, two-horse, and one-horse carts; while the purposes for which all these are used may be effected, we believe, as well by the use of one of them. It is needless to describe all the various little differences in the construction of these machines. They vary in dimension; some have attachments in front and behind, by which the length, and on either side by which the width, of the load may be increased. Some have broad wheels, which are necessary in harvesting Hay or Corn off the wet undrained districts in which they are used; others have narrow wheels, more fitted for the carriage of light loads on good roads.

In the practice of many well-farmed districts, it is shown that one form will answer certainly all the farm purposes, and perhaps almost all other purposes for which this variety is used. Economy requires a form of carriage which, while it will just hold a heaped load of dung, or a flat load of earth, or stones sufficient for the draught of one horse, may, by a simple means of increasing its size, be enabled to hold an equal weight of Straw or Hay.

On this subject we shall hereafter enter more into detail; at present it is sufficient to say, that if, as we know to be the case, a framework supported by only two wheels may be made to carry a full load for one horse—say 24 cwt.—of Corn in sheaf, the only result which could follow a union (in point of size) of two such frameworks supported by four wheels would be that injurious one of increased awkwardness and unmanageableness.

But let us for a short time consider the general question of cart *versus* waggon. There are many advantages possessed by one-horse carts over carriages requiring two or three horses to draw them. The second and the third horses, in the latter case, cannot exert themselves to such advantage when in trace harness as if each were between shafts. The strength of the foremost of a long row of horses, and of each of the others, in proportion to their distance from the weight, is expended on the useless labour of keeping those behind him in a straight line. This is particularly observable on going up a hill, when a horse naturally pulls to a side to try to lessen the draught. Unless they are under a skilful driver, some of the horses will be seen pulling one way, and some in another. On going down hill, again, the faults of this plan are equally evident, for the whole weight of the machine comes on the shaft-horse; while, were it divided amongst three or four in separate carts, each would have his share.

In an interesting Paper on this subject in the second volume of the Agricultural Society's Journal, the author states that he has, *after trial*, abandoned the heavy waggons of the district, and substituted in their place, for all farm purposes, the light one-horse cart; he states that the only objection to the one-horse cart system is, that the weight on the back of the animal distresses it. Now, here we think he is wrong; this weight, to which he objects, we believe to be both directly and indirectly advantageous. Directly—for if there be a portion of the load on the back of the horse, there will, of course, be less on the cart for him to draw. When an excavator loads his barrow with earth or stones, he loads it near the handles, that by having more to carry he may have less to wheel. And it is, we believe, *indirectly* beneficial; for when there is a portion of the load on the horse's back, he is better able to draw that which rests on the cart; his feet are firmer on the ground, of which he has thus a better hold, and along which he is of course better able to pull a heavy load; this may easily be seen when he is pulling up hill: the carter then always loads his cart forwards. If a pressure on the back of the horse enables him to draw a heavy load up hill, it will, to a certain extent, also enable him to support a heavy load without slipping on going down hill. There is no doubt, however, but that from a badly arranged load the animal will suffer going down hill, as the pressure is of course increased the more that the centre of gravity of the load is thrown forwards. To remedy this, the author of the paper alluded to recommends three ways. Two of these certainly tend to diminish this weight, though not to take it away. In one of them it is proposed to lower the box of the cart and pass the axle *through* it, so as to have some of the load below as well as above it. In the other, the author simply proposes to lengthen the cart and diminish the height of the load; and he gives a drawing of a very neat Corn-cart on this principle, of his invention. The third method which he suggests is, however, evidently founded on a mistaken idea, (see page 79, vol ii. Society's Journal). He proposes to load the cart at either end "so as to leave the middle space empty, so that, at the greatest descent it has to meet with, no portion of the bulk shall pass the plumb line" from the axle, "consequently no overbalance can take place, no weight can be thrown forwards." But the author forgets that it does not matter whether each of the two loads is on its own side of the plumb line; we must not only look at the fact, that the two equal weights are on either side of the axle or fulcrum, but we must look also to their distances from that fulcrum, and we shall find that if the cart be inclined, as when going down hill, both the front and hind portions of the load will be thrown forwards, the one portion from, and the other nearer to the plumb line from the axle, and thus the weight on the horse's back will be increased as before. If this weight be inconveniently great, the proper and simple remedy is to raise the shafts by taking up the back band of the shaft horse, and loosening the belly-band; or the load may be raised in front, and so thrown backwards, if it be a *tilt* cart, by means of the rail in front, which most carts of this kind have for that purpose.

We have digressed somewhat from the question which first engaged us, viz. the merits of carts or waggons for *harvest purpo es*, and in returning to it we would just say how only this point can be properly determined. If ten or twelve practical men, farming similar extents of similar land, and following the same method of harvesting their grain, excepting that so many used waggons and so many carts, were to keep a journal of their harvest operations, specifying the number of men, women, children, and horses, respectively employed strictly in harvest work, so many *hours* in *each* field—if they were to keep the Corn of each field separate and measure the *bulk* of it a month after harvest when it might be supposed fairly to have settled—and if they were to measure the distance of each field from the stack in which the crop off it was built, a comparison of those journals by any one acquainted with the general character of the crops on each farm, and with the strength and activity of the men and horses at work on it, would determine the question of the relative merits for harvest-work of the carts and waggons employed. The question is a very interesting one, and we should be glad to join with any, in an attempt of this kind, to answer it.

GEO-AGRICULTURAL NOTES ON SOUTH GLOUCESTERSHIRE.

IT is necessary to state at the outset, that in drawing up the following remarks, the various subsoils or geological strata occurring in our district are described in the reverse order of their deposition, commencing with the uppermost, *i. e.*, the kerse or alluvial land along the sides of the Severn.

Alluvium.—Along the eastern side of the Severn there is an extensive tract of alluvial deposit. Its eastern boundary, which is everywhere its junction with the marl of the new red sand-stone, lies, from Shirehampton on the Avon along the edge of the hills by Over and Almondsbury to Olveston, where it turns north-west, by Ingst and Aust. This constitutes the chief portion of the alluvial district. Another division of it, connected with this by a narrow band of land between Aust and Ingst, on the alluvial level, runs in a narrow tract along the shore to Oldbury, being bounded thus far by the rising ground between Littleton and that village; from Oldbury, the boundary of this tract runs south-east towards Thornbury, up to Rockhampton, Hill, and Berkeley, where it is terminated abruptly by the Little-Avon, up the banks of which a narrow band on the alluvial level runs as far up as Stone. The shore of the Severn from this to Oldmoor Cliff, north of Purton Passage, is abrupt. Near this, another tract of small extent commences, the principal portion of which gets the name of the New Grounds, having been taken from the Severn by embankment many years ago. This alluvial deposit is generally of a light blackish-brown colour, but towards Berkeley the colour is ruddier than anywhere else. It is a calcareous clay, produced by the degradation of the clays and limestones of the blue lias, and of the marls of the new red sand-stone, through which the river runs. Under the head *Alluvium*, also, must be placed those fertile districts down the sides of the many streams which everywhere intersect the county. The nature of the soil on these, of course, varies with that of the district through which the streams flow; thus, the soil on the banks of the streams down the valleys in the oolitic district is a rich calcareous loam, while that similarly situated in the coal district is either a stiff clay or a keen sand. The land on the alluvium is almost wholly pasture. Perhaps, out of a farm of 200 acres, a field of 6 or 7 acres may be arable. The fields are not small, and they are seldom crowded with trees. The Elm is the hedge-row tree. Orchards flourish on this soil. The small extent of arable land is generally cultivated wholly for the farmer's own consumption, for which, indeed, on many farms, it does not suffice. Wheat and Potatoes are the chief crops. Beans are also occasionally grown. The average of the Wheat-crop is from 28 to 30 bushels per acre—higher than anywhere else in the district; the Potato-crop is also generally good. These crops are, however, as in all cases on clayey soil, much dependent on the weather: a wet autumn and mild winter, or a dry season in spring and summer, are equally injurious: and

in this, in great measure, consists the difference in value existing amongst clayey and deep or shallow sandy soils: in the first case, the soil is easily injured by extremes of either kind of weather, and land of this kind is here frequently termed "casualty" on this account. In the case of a shallow soil, one resting on rock, injury is received only in very dry weather—the wetter the season is, the better for it; and in the case of deep sandy soils, although the crops are dependent in some measure on the weather, yet the injury received from extremes of either wet or dry is comparatively small. It is the great advantage of drainage, when accompanied by subsoil ploughing, that it removes superabundant water during a wet season, and affords a source of moisture in a dry one, thus tending to render all soils independent of the weather. The alluvial district, being perfectly flat, and also of considerable extent, a very slight fall can be obtained for water, and the drainage of the land, when attempted, is most imperfect. Almost universally, however, no drainage has been attempted—the occasional clearing out of the ditches being the only attempt to dry the land. The scourings of the ditches, mixed with the dung taken off the pasture-land, is all that the land to be mown receives; and this cannot be given to it each year. An average crop of 25 cwts. of Hay per acre is cut each year; and the value of the early spring and autumn feed is greatly beyond that of any other district of pasture-land in the county. Out of 30 square miles, which is the extent of the alluvial district, at least two thirds are mown each year.

Gravel.—Beds of gravel occur covering the clay of the lias near Slimbridge and Frampton, and also at Eastington and Stroud. They are generally of no great thickness; in the centre of that, however, at Frampton, the wells dug for water do not reach the clay. These diluvial deposits consist of fragments of calcareous rock, generally of a rounded flat lozenge form, varying from one or two inches in length to a mere sand. They must be due to the degradation of rocks of the oolitic series, as they are formed generally at the mouths of the large valleys which here intersect those strata; and the gravelly form is more perfect, the fragments are more perfectly rounded, the farther they occur from the oolitic district. Besides these extensive deposits of gravel there are numerous cases in which mere traces of a deposit exist; and these, though existing in so small a quantity, exert a great influence in improving the character of the soil overlying them.

Agricultural Character of the Gravel.—The surface of the district covered by the gravel is level, and, as has been already said, is comparatively bare. Fewer trees exist in the hedge-rows, when we compare it with the densely-wooded country surrounding it, and the fields are larger. The land is chiefly arable. Most of that at Frampton, for instance, is arable; perhaps, however, the half of that occurring at Eastington is pasture. The soil is a calcareous loam, not generally partaking much of the gravelly character of the subsoil. It varies in depth from upwards of a foot to less than three or four inches, constituting in the one case some of the best land in the county, but being in the other easily scorched by a drought of any continuance. It is a light soil, but when wet is apt to cling, and roll up before the plough; the plough in general use is of an old-fashioned form, having a large flat wooden mould-board, inclining backwards at an angle of 30° to the line of draught. This, one would think, would form a most imperfect implement, tending rather merely to push the furrow slice aside, than to turn it over; but when the land is wet, the farmers prefer it to the more elegant iron implements used in some parts of the county. It is generally drawn by three horses in a row. The subsoil is of a more retentive character than, from its gravelly nature, might be supposed. The water stands in the ditches in the fields near Frampton, during wet weather of any continuance. The greatest improvement might be effected here by the use of the subsoil-plough. The porousness which would thus be given to the subsoil, would render drains effective, though placed at very considerable intervals. The greatest difference is observable in the management of land on the gravel. Two farms over which I went, presented a great contrast. On one the four-field system was adopted, for which the soil is remarkably suited. On the other no system at all was followed. Sometimes Wheat was followed by Beans, which were succeeded by Wheat; after which the land was fallowed, and then Wheat again taken; or Wheat was taken during two successive years; or it was followed by Barley, and then after one year Clover, Wheat was again taken; or sometimes, Wheat being twice taken in a four years' course; the intervening crops were Potatoes or Swedes, and Vetches or fallow. The consequence was, that in the one case the land was clean, and the crops good, while in the other the land was foul and the crops inferior. These instances, though occurring at a considerable distance from one another, were on precisely the same kind of soil, and they show how much the value of land depends on the cultivation it receives. The four-field course is adopted near Frampton, Wheat, Turnips or Swedes, Barley, and seeds occurring in succession. The average crop of Wheat is above three quarters to the acre: the Red Straw Lammas is the kind generally sown. Indeed, this variety is held in general estimation all over the county. White Wheats are seldom sown. The Wheat is always sown in autumn, generally towards the end of September; when, however, forced by weather to postpone the sowing till spring, Spring Wheats are seldom used—the seed is not changed. The crop following Wheat is generally Turnips or Swedes. This is sown broadcast; the plants are singled out in the usual way, when the rough leaf appears, and a second hand-hoeing is all the cultivation they receive. Large crops are therefore seldom raised, and when they do occur, are due to a fortunate meeting of circumstances, more than to any excellence in the mode of their cultivation. I should think eight or ten tons per acre was above the average of this crop on this soil. The Turnip-crop is eaten on the land by sheep, or taken to the yard, according to the necessity and will of the farmer. If he be well provided with Hay, it is given partly to fattening oxen in his yard, or feeding stalls, and partly to sheep on the land; if otherwise, however, he is forced to use it for his dairy stock. The Turnip-crop is succeeded by Barley. Being a Barley soil, good crops are raised on it; four to five quarters per acre are perhaps above the average. Clover seeds, and the common Rye-Grass are sown with the Barley, and, after remaining one year down, are broken up for Wheat. The old pastures on the gravel are close and sweet, but very short. The crop of Hay is entirely dependent on the weather; it is very easily scorched by dry weather. An examination of the waste land on the gravel, shows that the unassisted fertility of this soil is very great. Frampton Common is the finest in South Gloucestershire, and perhaps one of the finest in the kingdom. The Grass is naturally good; no weeds of any kind are to be seen. The Common is surrounded by houses and trees, for which it forms a most beautiful natural lawn. The following facts relative to the value of the soil on this deposit, show how great an improvement may be permanently effected in soil, by the admixture of earth of a kind different to that chiefly occurring in it. The land on the gravel near Frampton is valued at 25*s.* an acre. The land on the clay, on which the gravel lies, is of a most perfectly opposite character, and is valued at 20*s.* per acre. There is, between the two, a band of soil where the gravel thins out over the clay, which is valued at 35*s.* an acre. This band is about 70 or 80 yards wide. These valuations were made by a committee of farmers, appointed by the parish for the purpose of apportioning a new rate. This great difference in the value of the land around the edge of the gravel, is also observable, though not in so marked a manner, at Eastington. It was explained by one of the farmers who observed it, by supposing that while the soil on the gravel is easily burnt, and the soil on the clay easily injured by wet, that lying between the two will not be liable to injury in either way: it will possess the lightness of the gravel, and the roots of the plants cultivated on it will at the same time reach down to the clay. The soil in this narrow band is evidently due to a mixture of the clay and the gravel.

WINTER FOOD FOR DAIRY COWS.

IN several Numbers of the *Gazette* opinions have been given about food suitable for dairy cows in the winter season; having experimented a little on this subject myself, I may perhaps be able to add somewhat to the stock of information already given to the public. I will first set out with the articles my experience has proved to be deleterious, as far as the flavour of butter and cream are concerned. About 15 years ago, Mangold Wurzell was puffed off by certain parties as leaving nothing to be wished for, as winter green food for dairy cows. The increase of milk from its use was said to be extraordinary, and the butter was rich in colour and highly flavoured; as one of the many dupes to this figment, I allowed about a bushel *per diem* to be given to each cow, with as much hay as she would eat; a fortnight's trial was quite sufficient to put an end to the experiment; both the butter and cream were declared to be disagreeable, and unfit, from their acrid taste, for all table, and many culinary purposes. Common Turnips and Swedes need no comment; every one that has tasted the milk or butter of cows fed with them is satisfied of their unsuitableness for the dairy, and the same may be said of Cabbages, Rape, &c. Brewers' grains, if given in any quantity, give their own peculiar flavour to the butter. The last article that I shall notice as one to be avoided, is old after-pasture, when the Grass is withered, in the last two months and in the first three months of the year; this Grass, in wet weather, imparts a disagreeable rankness to butter, that not unfrequently attaches the blame to the dairy-maid; because the cows having had nothing but Grass, the cause is unaccountable. Among the articles that give increase of milk and well-flavoured butter, good oil-cake holds a prominent place—one in the morning and one in the evening will have an astonishing effect; to this may be added bran or pollard, where it can be had reasonably; two or three gallons twice a day will greatly increase the milk; and with the bran, if the cows have a taste for it, may be mixed a gallon or two, or more, of malt-dust; all these give a rich flavour to butter, and increase the quantity of milk. Of roots, I have found three to be great and agreeable assistants to dairy produce: of Potatoes, every table variety—Carrots, red and white, and Parsnips. The first named I use sparingly—about two gallons a day, sliced raw, and about three gallons of each of the other roots sliced also, and *mix them* all together when I have the opportunity; as long as the Potatoes are fit for table-use, so long they may be given to the cows, but as soon as they become spotted and of an earthy taste, they are no longer fit for dairy cows; the other roots may be given as long as they continue sound; nothing decayed or mouldy must be given; one ill-flavoured root will spoil a whole churning. The butter, from this plan of feeding, is delicious—superior to other winter butter I have hitherto tasted.—*J. Steele, Epsom.*

AGRICULTURAL IMPROVEMENTS.

(*Continued from page* 488.)

WITH regard to the pecuniary relation of landlord and tenant, I shall endeavour to show that long leases and a Corn-rent (that is, the value of so many bushels of Wheat at the current price of the day) are essentially beneficial to both landlord and tenant, as well as to the country at large. Under this system landlord and tenant have but one common interest—they rise or fall together. The present custom of fixed money-rents acts alternately most injuriously on both. An unexpected war may find a tenant benefiting by an enormous price; whilst his landlord has only his four per cent., reduced, in fact, to two per cent., by all commodities having risen to war prices.

On the other hand, a tenant hires on a war lease—a sudden peace makes him bankrupt by the violent reaction; and still his landlord must let his farm at peace prices, whilst he was deprived of war benefits. The landlord is evidently the greatest sufferer, and should hasten to amend so unfair and so ruinous a system. The want of a well-founded code of rules for agricultural improvement is much felt. At present each individual claims for his own plan the palm of excellence. This should no longer be. Our Royal Agricultural Society, to which every landowner and farmer should belong, has already effected vast good; but still greater remains to be done. They should have extensive model farms, with schools and libraries attached. There should be shown, after patient investigation, the most perfect and certain modes of drainage, irrigation, and warping; the most complete, durable, and economical arrangement of buildings; the most advantageous mode of tillage and course of crops; the greatest economy of manure and labour; the minimum of seed and maximum of distance in sowing; the stage of ripeness at which grain should be harvested; the effect of steeping seeds in manures; the most profitable mode of housing and feeding stock, and the advantages of removing all trees and fences. When all these national and important subjects are accurately ascertained by a competent but limited board of paid and responsible directors, deciding regardless of personal considerations, then let a code of unerring rules be promulgated and enforced with the full weight and sanction of the Society, as a guide and beacon to the doubtful wanderer in search of agricultural knowledge, who, eager to avoid the shoals of error, is now distracted by multitudinous and conflicting opinions.

Chemistry and mechanism will, no doubt, daily lend new aids to Agriculture; but the points I have mentioned must always form the unalterable basis of our agricultural structure.

Much is being said about how we are to pay for our foreign Corn importations, whether in goods or in money. This is not our affair at all—we are purchasers. If you will have foreign Corn, Flax, and other things, that you might profitably produce at home, you must pay for them; and the seller (the foreigner) will not allow you to dictate to him how he shall take his payment, whether in goods or in money; that is his affair—not yours. The whole question of foreign Corn importation is, to my mind, trivial and insignificant, as compared with the importance of national agricultural improvement; and I hope to see the latter occupy the minds and speeches of our statesmen and orators to the exclusion of the former.

Let us grow Corn instead of timber, fences, and rubbish: we can do better without one than the other. I am told, "We must have timber! What should we do in case of war?" I answer, "How do we get our tea, coffee, wine, and every other foreign article in time of war?" So long as we have money to buy, and hearts of oak to defend and convoy our purchases, Old England can never feel a want, nor want a market to buy in. Besides, what a gross folly it is to grow our own timber in Corn-fields, at a cost of four shillings a foot (I am sure it costs more), when we can import it at one-third the price.

Some gentlemen think the removal of fences and throwing open the country would be detrimental to game. This is contrary to the proof: wherever land is thoroughly drained and the Turnip culture introduced, so surely will game (if protected) thrive and increase. Wet and pasty undrained land is inimical to game—particularly in a wet season.

A great error amongst farmers is the desire to grasp a large quantity of land, instead of concentrating their capital by improvement in a smaller compass. One of the important results of my suggestions as to valuing and making improvements, would be, that instead of 6*l.* to 8*l.* per acre being (as it is now on an average) a sufficient tenant's capital, double that amount would be required, as on my farm. This alone would find employment for considerably more than one hundred millions of additional capital, so that, in fact, when we had disposed of all our foreign bonds and securities, I doubt if we should have near money enough to carry out entirely my practical scale of improvements, except slowly and gradually.

Let Agriculture form an honourable portion of our general education—why should it not? Let Tull and Tusser range side by side with Homer and Virgil. Then would our nobility and gentry be independent of incompetent or dishonest stewards and land-agents, and be able to appreciate those of a more worthy character. Agricultural education and apprenticeships for our young farmers are indispensable. Why should there not be as much uniformity in growing a sack of Corn as in manufacturing a piece of cotton, or a hat or coat? How many a worthy person, retiring from the toils and turmoils of a busy city to enjoy the tranquil peace of Agri-

culture, regrets the want of agricultural knowledge!—often are his hopes and intentions frustrated and his property diminished by interested or erroneous advice, of which, till too late, he cannot judge. When I see landlords making returns of rent (in my opinion an injudicious operation), I think how much better would it be to present their tenants with agricultural libraries. Farmers, from the very nature of their occupation, and their isolated position, are seldom able to travel from county to county in search of facts; but how readily is a multitude of agricultural experiments and experience brought to their fireside by a selection of good and practical books! Some may say, "Oh, farmers are too prejudiced to read." Experience has taught me the contrary. Bring them the book, they will keenly, anxiously, and with sound sense, scrutinise all that concerns their pecuniary welfare. Reason tells us that the farmer, born, bred, and mixing with others of precisely the same way of acting and thinking as himself, cannot be expected to have so expanded a mind as a manufacturer or trader, who is daily in contact with strangers from every corner of the globe.

It is to be feared, too, that jealous landlords form too low an estimate of a farmer's character, and consider his success and elevation as degrading them—as if his gains were their loss. Let us hope this feeling will gradually give way to a better, and that a farmer who follows the hounds, and dresses and acts respectably, will be considered quite as likely to farm well and make as good a member of society as one who imitates in every respect one of his labourers.

Where individuals are desirous of improving their own estates without disbursing capital, I know of no plan so good as allowing the tenant annually a certain sum out of his rent for improvements, taking care that they are really beneficial, which is very easily ascertained and arranged: generally speaking, tenants would most readily contribute their share, particularly in the matter of drainage.

The national health is deeply concerned in agricultural improvement, for it is notorious that perfect drainage of land and buildings insures the absence of agues, fevers, and other complaints, that are sad drawbacks to the personal welfare and pecuniary comforts of our agricultural population, to say nothing of the importance, in a national point of view, of having a hardy, healthful race in lieu of a debilitated and vitiated population. The mind and the body are too sympathetic to be uninfluenced by each other. Humanity, policy, and self-interest, then, call loudly on us to unite for the worthy purpose of national agricultural improvement.—*I. J. Mechi*, 4, *Leadenhall street.*

P.S. I shall publish annually a faithful and correct debtor and creditor account of my farm, valuing the crops and stock at one uniform average price (the average price in the county of Essex for the last fourteen years). This will prevent confusion, and admit of a correct comparison of one year with another. The quantity produced, and the cost of producing, will be the principal and most interesting considerations.

ON THE APPLICATION OF MANURES.

(*Continued from page* 487.)

Now, the improvement of the plants from repeated hoeings is indisputable; that it is not promoted through the roots is, I think, probable (proveable), for the hoeings are not deep enough, the earth is not moved by them to a sufficient depth to renew the decay and form a fresh portion of carbonic acid, about the roots of the plants. How, then, do they operate this improvement? I say, by letting loose the effluviæ of the decaying animal and vegetable matters contained in the soil, to the depth, or to a very little more than the depth to which their loosenings extend, (it is evident to the senses that such effluviæ do escape) and by these effluviæ being absorbed by the leaves, and not by the roots.

The same deduction may be drawn from all our field operations. In the month of February or March, if, either from the poverty of the soil or weak growth of the plants, it appears requisite, many will top-dress their Wheat crops. It is usual to top-dress Red Clover (a tap-rooted plant, and therefore one plunging deeply into the soil) between the cuttings, with a view of increasing the immediate after-growth; Grasses are top-dressed. In Ireland, where they know how to grow as heavy a crop of Potatoes, as well as to eat them, as anywhere else, a very evident improvement takes place immediately after shovelling (moulding) the beds; on the west coast of Donegal they very generally are at the trouble of carrying manure in baskets, and laying a little bit at the butt of each plant, previous to shovelling (moulding the second time) the beds, the plants being at this time from two to six inches high. They state that this is attended with very beneficial effects; that it keeps the stalks green and growing longer than they would be without this application; these people will also dibble in their Potato sets, and delay manuring them till they are breaking ground, and they say they are less weedy and more productive than if manured earlier.* In all these operations it is impossible to attribute the results to any action on the roots; they must be attributed to the absorption of effluviæ disengaged from decaying animal and vegetable matters by the leaves of the plants.

* In Ireland, the small farmers rarely drill their Potatoes, they generally plant them in beds from three to five feet wide, according to the depth of the soil, allowing the necessary earth for covering the beds; the sets are either laid on the surface or dibbled in, the manure spread on the surface and covered from the furrows; where the plants appear, or before they are six inches high, the beds are again covered, and it is reckoned good husbandry to give them a third covering from the furrows.

In 1831, at Kilybegs, I transplanted Potato sets from a hot-bed into drills in a field; the operation (as will always be the case when labourers are entrusted with novel, and to them foolish work) was so indifferently performed that the manure was scarcely covered, yet the crop was an excessively heavy one, and the Potatoes very large. Three years ago I planted a small patch of Potatoes in rows, the sets being planted in rows six or eight inches deep. I spread short stable dung on the surface, with the intention of digging it into the ground: this was neglected, and I believe they were not even hoed, or at most not more than once; the crop was so very heavy, under a treatment so widely at variance with received opinions, that it led me to suspect that the plants had received nourishment through their leaves from the effluviæ of the dung spread on the surface.

A few days ago I got into conversation with a tenant of Mr. Greville's, near this town; he was ploughing an Oat stubble for a second crop of Oats; I inquired, would he not have had a better crop had he sown it in February or March? He said no; that Oats sown on poor land, in the "darks" of April (when there was no moonlight), were a better crop than if sown before the natural heat came into the ground; (on the west coast of Donegal, as well as in many parts of Ireland, April is considered a good seed-time for Oats)—that if sown earlier it would perish the plants—meaning that the plants in their earlier growth would be sickly, (and if we admit the efficacy of steeping seeds, the sickliness of the young plant must upon the same principle be injurious to their future growth); and that the later sowing would overtake it, and prove a heavier crop at harvest; this is the general opinion of the smaller holders of land in Ireland, and is the result of an experience which we have no right to despise. I have for 25 years heard this opinion expressed, and have hitherto contemned it as that of prejudiced ignorance and a lazy excuse. We are too prone in our self-sufficiency to taunt with their failings the poorer classes of Irish, and probably with as little reason as in the present instance. To what, then, are we to attribute this fact? and fact it is—but that in poor ground, in the early season, the seed germinates so slowly that the gases let loose by the ploughing escape, and the surface becomes crusted, so as to prevent the escape of any that remain before the germ has reached the surface; when it does get above ground the young leaves are therefore starved. When the leaves of young plants look sickly and yellow, which is, I think, falsely attributed to the wire-worm, it is common to roll the ground; this breaks the crust (not crushes the worm) and the nourishment the leaves consequently receive from the escape of gases restore them to health.

The Editor of "Liebig's Chemistry of Agriculture," on the authority of "Davis's History of China," says—"In the case of everything except Rice, the Chinese seem to manure the plant itself, rather than the soil;" and Liebig himself says, "How infinitely inferior is the agriculture of Europe to that of China!" And again he says, "The agriculture of their country is the most perfect in the world." In speaking of guano he also says, "Thus in Arica, where so much Pepper (Capsicum baccatum), is cultivated, each plant is manured three times: first, upon the appearance of the roots; second, upon that of the leaves; and lastly, upon the formation of the fruit (Humboldt); from this it will be observed, that the Peruvians follow the plan of the Chinese in manuring the plant rather than the soil." Yet Liebig always supposes that plants are fed by the roots, and is even at the pains of bringing ammonia from the air, with every shower, to supply them with azote, which he states to be washed down to them with the rain-water, and adduces what I must think a very questionable proof; he says. "In the year 1834 I was engaged with Dr. Willrand, Professor of Botany in the University of Giessen, in an investigation respecting the quantity of sugar contained in different varieties of Maple-trees which grew upon soils which were not manured. We obtained crystallised sugars from all, by simply evaporating their juices, without the addition of any foreign substance; and we unexpectedly made the observation that a great quantity of ammonia was emitted from this juice when mixed with lime, and also from the sugar itself, during its refinement." Now, if the sugar had been obtained from the ascending sap, this would be a very sufficient proof that the ammonia had been imbibed by the roots from the ground; but as there can be no doubt that it is from the descending, and, if you will, elaborated sap, that the sugar was obtained, it might be asserted with more probability that the ammonia had been sucked in by the leaves; and it does appear more agreeable to the evanescent nature of ammonia, that instead of descending into the depths of the earth to seek the roots, it should, when the shower which had lodged it on the surface had ceased, with the first blink of sunshine ascend into the air, and, on approaching the leaves, be sucked in by their pores; and were it not even so volatile, Liebig himself would admit that the evaporating moisture would communicate a similar state to it. Now, we find precisely the most rapid growth of plants is in the spring months, when the showers are not so heavy or continuous as to sink into the earth, but are succeeded instantly by a hot sun; and this is called proverbially growing weather.

On the same principle I can well account for the effect which is said to attend the steeping of seeds in chemical solutions, and the success which their experience has taught the Chinese to reckon on from steeping their seeds in liquid manure until germination begins; the seeds absorb a quantity of concentrated gases, which are gradually let loose to feed the shooting germs; these also break through the surface and attain some growth before all the gases have escaped, which have been set in motion on the moving of the earth in the sowing of the seed; the plant thus acquires an early robustness, which, under ordinary circumstances, maintains its superiority through its whole growth over plants which have not been so treated.—*T. M. G., Revenue Police, Granard, Ireland.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

In describing the different modes of ploughing, I shall first suppose the land to be nearly level, as is usually the case after summer fallow, or after the separation of drilled crops from the ground. As the furrows which divided the original ridges are then nearly or altogether obliterated, the foreman, provided with three or more poles of a known length, marks off the field in the usual manner, into parallel and equal divisions, corresponding in size to the intended ridges. The form of the ridges, and the situation of the intermediate furrows, are carefully preserved from year to year, especially when the former are much rounded or elevated in the crown, as is the invariable custom in strong retentive soils. The position of the furrows are never altered except in situations where the land happens to be very dry and light. In ridging up such of the fields as had been recently furrow-drained, much care is taken to have the furrows directly over the drains, in order to facilitate the escape of surface-water into them. It will be recollected, that drains are now invariably made in the furrows, either in each, or in every alternate one, as may be found necessary or convenient at the time. When the furrows are obliterated or not distinctly visible, from the effects of subsequent tillage, the situation of each drain is accurately ascertained by digging with a spade until the tiles or stones employed in filling it are reached. The feirings, which afterwards become the crowns of the ridges, are then drawn midway between the drains. In ridging up land for Wheat or other Corn crops, after having been nearly levelled down while undergoing the process of summer fallow, or the operations preparatory for green crops, the method of ploughing termed gathering, is that generally adopted in heavy soils, as giving to the ridges a greater degree of curvature than what can be done in any other way. Besides the common mode of marking off land with the aid of poles, before ploughing it into ridges, the following simple method is practised in some parts of the county, and in Berwickshire, for the same purpose:—A stout pole, called a *marker*, equal in length to the breadth of the intended ridge, is fixed to the plough at right angles to the line of draught; one end of it is attached by a simple contrivance to the beam a little before the coulter, while the other projects either towards the right or left-hand side of the ploughman, as may be required, and is kept steadily in its place by means of a rope passing from the outer end to the collar of the horse, on the same side as that to which the pole projects. A small coulter or *harrow-tine* is attached perpendicularly to the outer extremity of the pole, which traces a mark or rut on the ground as the plough moves onward, parallel to the line of draught, and sufficiently visible to serve as a guide for the ploughman in drawing his next line. When arrived at the headland, he alters the pole to the side opposite to that on which it was last, proceeds with his plough along the track newly made by the marker, and in doing so, traces another track with the pole exactly parallel to the last. In this manner the whole field is gone over. By adopting this device, it is only necessary to mark off the first feiring with the aid of poles in the usual manner, at the proper distance from that side of the field parallel to which it is intended to run the ridges, as the marker traces the line in which the next and every succeeding feiring is to be drawn. This plan has been found to answer very well on light friable soils, and in situations where, on account of the inequalities of the surface, a considerable number of poles would be required in laying off ridges in the ordinary way.

Much pains are everywhere taken by the ploughmen, in forming these ridges, to give them a uniform degree of curvature, and to have the furrows as straight, shallow, and narrow as possible, as the land is then usually sown out with Clover and Grass-seeds. The first two furrow-slices around each side of the feiring, or crown, are ploughed shallow; the next few something deeper, and the remainder gradually lessening in depth towards the furrow; the ridge thus obtains a regular degree of rotundity or elevation. In ploughing the last, or hinting furrow-slice of a ridge in strong wet soils, one of the horses is usually unyoked from the plough, in order to prevent any injury to the land from treading upon it. Sometimes, when the soil is of a very stiff nature, the horses are yoked one before the other while finishing the ridge, both walking in the furrow. No footmarks are permitted to appear on the land after being ploughed.

When land is thus formed into ridges, it is afterwards ploughed, without marking them off anew until the furrows are effaced by subsequent tillage. In ploughing *lea* or Grass lands, the system of ploughing, termed *casting*, is that universally practised. When this mode is pursued, the feirings are always made in the furrows, and in a manner somewhat different from that adopted in the case of gathering. In casting ridges the assistance of poles is entirely dispensed with, a commencement being made by taking a slice from the left hand side of the furrow in which the feiring is to be made; small-furrow slices are next ploughed from each of the adjoining ridges—one resting upon that first ploughed, and the other falling into and occupying the situation of the original furrow; two slices of ordinary dimensions are then ploughed up to these from each ridge after

which the plough is made to pass over the space occupied by the old furrow, in order to clear a channel for the free passage of water; but where the land is dry and light, not being so liable to suffer from the retention of moisture as strong clays, this last operation is frequently dispensed with. The two ridges are then ploughed together, by turning the horses at the headlands to the right-about; that is, the ridges are hupped in, the successive furrow-slices of both ridges inclining towards the furrow between them. Another feiring is made, after concluding three ridges, in the fourth furrow from that in which the last one had been drawn, and the adjoining ridges ploughed together as before. Two unploughed ridges are thus left between the four already accomplished, in ploughing which, the ploughman begins at that side of either ridge adjacent to the ploughed ones, lays in a small slice directly over the former furrow, and does the same in returning along the other ridge; two furrow-slices of the regular size are then ploughed up to these, and the plough made to pass through as before, not allowing the irons to enter the soil. These two ridges are then completed by turning the horses at the headlands from right to left, that is, they are winded out, the operation concluding at the intermediate furrow, which, hence, becomes what is termed an open furrow. By this manner of ploughing, which is now the most generally practised on all kinds of land throughout East Lothian, the form of the ridges and the situation of the original furrows are preserved. All the furrow-slices of each two adjoining ridges incline in the same direction, while those of the next pair lie in the contrary way.

The principal advantages resulting from this mode of ploughing arise from the small number of open furrows thereby occasioned, only every fourth being an open one; and to any person accustomed to inspect Corn-fields, particularly in droughty summers, who compares the stunted appearance of the crop, in and about those deep open furrows, with the luxuriance and freshness of that in the close furrows, as the others are called, the utility of diminishing the number of the former will be abundantly evident. To lessen their number as far as can be conveniently done, eight ridges, instead of four, are frequently taken in at once—the feirings and open furrows occurring only at intervals of eight ridges; four of the latter being hupped in and four winded out. But in this case, where the field is not of considerable length, a loss of time in so frequently turning at the headlands is unavoidably occasioned. When the field, or ridge-lengths, to be ploughed happen, therefore, to be short, only four ridges are taken in at once; but when of considerable length, eight ridges are ploughed with one feiring. This mode of ploughing—casting the ridges—has been found peculiarly adapted to strong clayey soils retentive of moisture, in which the ridges had been raised by previous ploughings.

The only material imperfection arising from casting is, that the open furrows, from being made in the situation of the previous ones, are necessarily deeper and barer of earth than when, as in the case of crown-and-furrow ploughing, they occur in the middle of the ridge. To obviate this defect, either of the two following plans is sometimes adopted in ploughing lea:—Instead of four or eight ridges, five or nine are taken in together; the feiring is then made either on the crown of a ridge or in a furrow; if on the crown, that ridge and the two at either side (supposing nine ridges taken in), are ploughed together as before, and the others winded out, concluding in a furrow; but when, as is most generally done, the feiring is made in the open furrow, four ridges are hupped in and five winded out, terminating at the crown of the central ridge, which is thereby cloven into halves. When next ploughed, this and the four adjoining ridges are gathered, the other four winded out, and all restored to their original position.

Whilst the ploughing of the lea is being carried on, all the skill, taste, and anxiety of the ploughman are brought into action. Each man has a certain number of ridges to himself, and when several experienced ploughmen, all nearly of a match in point of skill, are working together, the greatest competition prevails amongst them. The ploughs and their irons are always kept in the best working order, and every exertion is made by each man in endeavouring to execute his work in a style superior to that of his neighbours. To excel in straightness and regularity, in cutting a good *shoulder*,* and in packing the furrow-slice closely together, is the great ambition of every good ploughman.—*T. Sullivan.*

Home Correspondence.

Guano.—Contracts for Ichaboe African Guano have been signed to be delivered from March to middle of May, 1845, at 6*l.* 6*s.* per ton, ex ship, port of Liverpool. The last news from the Island of Ichaboe was that 100 ships were then waiting their turn to load; and in order to give dispatch to the vessels waiting their turn to take in their cargoes, the crews of other ships were assisting in loading the vessels in berth. It is also said by some, that in 12 months the stock of guano in Ichaboe island will be exhausted; but it is said there are other islands equally valuable. If that was the case, why should so many ships accumulate and wait so patiently their turn to be laden? The supply of African guano is very liberal; and although a week back the trade was very dull, the late rains have given great encouragement for the sale. It is also calculated by many importers that guano will be bought on better terms the next three months, than will happen again for years; for the number of ships on their passage to load at Ichaboe island, and those returning laden, will overstock the market, as the season will be over before they can arrive.—*W. H. Harwood, Liverpool.*

Compost-heaps.—I have been in the habit of paring the sides of roads, ditches, &c. for the last 30 years, and have found much benefit from laying it up for compost and trenching it into the soil. If farmers and cottagers would follow my example, it would be a great benefit to them. If a clause was inserted in the Turnpike Act, to force all occupiers of land &c. to cut down all tall-growing weeds, such as Docks, Thistles, Nettles, &c. as far as their lands and premises extended, twice in the summer—say middle of June and middle of August—it would be of much benefit to the country at large.—*F. X. O.*

Bran.—"H. Lawson," (p. 421,) will find in the first volume of Boussingaults "Economie Rural," p. 464, that bran consists of gluten and albumen 20. and gum, &c., 28.10, fatty matter 5.5, woody matter and ashes 45.7., total 100.—*C. J. Lancaster.*

Vitality of Seed.—With reference to Mr. Bernays's communication in a late *Gazette*, it may be in your recollection that a few years ago, every other person one met was swallowing quantities of Mustard-seed to promote digestion—the whole of which passed off without any other perceptible change than that of being a little swollen, and thus, perhaps, made more ready to germinate. Why, then, may we not presume that the seeds of weeds pass equally unaltered through the bodies of many animals? A writer in a recent Number of the *Gazette*, stated that one cwt. of salt would destroy all the seeds in a ton of dung. Now if this be the fact, may we not first destroy the seeds by mixing salt with the manure-heap, and then, after a time, treating it with sulphuric acid? We should thus get rid of our weeds; and then by the reaction of the salt, sulphuric acid, and ammonia, we should get the fixed salts of sulphate of soda and muriate of ammonia. See Solly's "Rural Chemistry," page 41.—*Agricola.* [Our correspondent's suggestion is probably correct so far as all animals that do not chew the cud are concerned. We have heard that one of the quickest ways of obtaining young hawthorn plants, is to feed geese on the haws, and sow their manure. In all except ruminating animals, if seed given in their food be not crushed in the act of mastication, it will rarely be injured by the process of digestion.]

Liquid Manure.—When the weather is wet, I propose carting the liquid at once upon fallow ground; having at this time a very good crop of Potatoes growing on the very poorest piece of ground about me, entirely owing to having in the winter carted out upon it the overflowings of my farm-yard.—*A Beginner.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

JUDGING from the numbers and quality of the articles—Implements and Live-stock—exhibited at Southampton during the past week, as well as from the number of visitors attracted thither from all parts of the kingdom, we may believe that the late meeting of this Society may vie with any of its predecessors in point either of interest or usefulness.

In reporting the proceedings of the past week, we shall proceed in the order of time, that being a simple arrangement, and one more likely than any other to present an intelligible statement to those of our readers who have been absent.

The Judges of Implements having been occupied during Monday in ascertaining their merits, by test as well as examination, it was not till Tuesday morning that the public were admitted to the Show-yard. In the following imperfect description of what was there exhibited, a comparison has first been drawn between the Exhibition of this year and that of last, in order to which advantage has been taken of the report by the Society's Judges of the Derby meeting in a late vol. of the Journal.

The following paragraphs retain their truth. We apply them to the Exhibition of the present year:—

"The Judges have again the gratification of recording that, in number, variety, and perfection, this Exhibition greatly excelled all that preceded it. Perhaps a more substantive proof of the progress made in this great department of the Society's solicitude cannot be adduced, than hat the exhibitors annually outgrow enlarged show-yards, and intreat more stringent and exact trials of their implements. It is thought that the following analysis of the contents of the show-yard may not only serve to convey a just idea, but be a proper historical record, of the magnitude and variety of the collection; and that it may tend to confirm the Council in their desire to render the catalogue of implements a perfect register of the Exhibition. As such, the catalogue would become not merely a momentary guide, but a useful annual work for native and foreign purchasers to consult, after as well as during the Show. The analysis now given, as prefatory to the award of premiums, and usual short account of some of the implements, presents a concise classification of the machinery employed in various departments of British husbandry; and it may possibly aid the Council in selecting the objects or classes which more particularly demand future encouragement by the Society. As a digest of the nature, number, and value of the implements in habitual use by farmers, it cannot fail to impress the mind with the importance of agricultural mechanism as a branch of national industry, and as consuming an immense amount of native materials."

We have made use of this analytic statement of the implements then at Derby, and, as follows, we have added a column, giving as nearly as a necessarily hurried examination would permit, a corresponding analysis of this year's Exhibition. It may be mentioned in proof of the accuracy of the first sentence quoted above, as applied to the Southampton Show, that the money value of the implements exhibited, was upward of 9200*l.*, while that of those shown at Derby amounted to 7400*l.* only.

ANALYSIS OF THE EXHIBITION.	No. of Articles Exhibited at Derby.	No. of Articles Exhibited at Southampton.
TILLAGE IMPLEMENTS.—PLOUGHS.		
Swing, moulding and ridging included	48	51
One-wheel	15	27
Two wheel, double-furrow included	55	66
Subsoil, common	3	..
Ditto, various	6	10
Sub-pulverisers	4	..
Ditto and Surface-ploughs	3	..
Ditto and hoes	2	..
Stubble and paring	4	6
Water-furrow clearing, or Boat-plough	1	..
Draining	3	..
Drill-ploughs, one-row	3	..
Ditto, three-row	1	4
	—148	—163
HARROWS.		
Common, and improved	19	..
Drag, and scarifying	2	..
Extirpating	1	..
Lever	2	..
Revolving and sowing	1	..
Ditto, vertically	1	..
Ditto, horizontally	1	..
Chain-web	3	..
Folding	1	..
	—31	—28
SCARIFIERS.—Cultivators, grubbers, scufflers, included	25	36
CLOD-CRUSHERS.—Various	7	13
ROLLERS.—Various, cast and wrought iron	12	16
COUCH-RAKES.—Various	4	5
DRILLING, SOWING, MANURING, AND HOEING MACHINES.		
DRILLS AND PRESSERS.		
Drills for corn and seed, with manure	14	..
Ditto, ditto without manure	1	..
Ditto for Turnip-seed with manure	16	..
Ditto ditto, without manure	1	..
Ditto ditto, with manure-cart	1	..
Ditto for seeds, with manure	3	..
Ditto ditto, without manure	10	73
Ditto and Pressers, with manure	6	..
Ditto ditto, without manure	4	..
Ditto for solid manures only	1	..
Ditto for liquid manures only	1	..
Pressers, without drills	2	..
Seed-sowing Barrow, without manure	1	..
Drill-ploughs—(see PLOUGHS.)	—61	—73
DIBBLERS.		
Five-row horse dibbling machine and sower	1	..
Two-row ditto ditto	1	..
Two-row hand or horse dibbling wheel	1	..
One-row hand ditto	1	..
HORSE-HOES.—Broad, narrow, and variously contrived, to suit drilled crops	—4	—3
	20	23
HARVESTING MACHINES.		
HAY-MAKING.—Tedding machines	4	..
HORSE-RAKES:—Hay, corn, and stubble	7	13
Corn Gatherer	..	1
	—11	—14
BARN MACHINERY.		
HORSE-ENGINES:—Various powers, travelling and fixed	7	several.
STEAM-ENGINES.		
Travelling, for threshing, &c.	3	..
Applied to Corn-mills, &c.	3	..

Consisting of iron pig-troughs, pens, cow and sheep cribs on wheels, mangers, racks, &c.	..	..
Fodder preserver	..	..
WEIGHING MACHINES.		
For carts, cattle, sheep, &c.	4	14
FIRE-ENGINES, &c.		
Fire-engine, with irrigator, attached to steam-engine	1	..
Ditto, hand and portable	4	..
Garden-engines, various	6	..
	—11	—14

* This phrase, though well understood by ploughmen, is not easily explained with precision. It means a particular form or appearance presented by the furrow-slice after being turned over. The advantages of ploughing Grass lands with a good shoulder are, that the surface is enabled to resist the winter rains, and afterwards to produce a proper covering for the seeds.

AWARD OF PREMIUMS.

The following is the Award of Prizes for Implements, so far as it has yet been published.

	Premiums.
I.—Ploughs.	
To Messrs. J. R. and A. Ransome, Ipswich, for their heavy land Plough.	10*l.* and Silver Medal.
To Messrs. J. R. and A. Ransome, Ipswich, for their light land Plough	10*l.* and Silver Medal.
To Messrs. J. R. and A. Ransome, Ipswich, for Locock's patent Plough	5*l.*
To Mr. John Bruce, Stratford-on-Avon, for his skim Plough	5*l.*
II.—Drills.	
To Mr. R. Garrett, Saxmundham, for his Drill for general purposes	20*l.* and Silver Medal.
To Mr. J. Smyth, Yoxford, for his Turnip and Manure Drill	10*l.* and Silver Medal.
III.—Scarifiers, &c.	
To the Earl of Ducie, Dursley, for his Cultivator	10*l.* and Silver Medal.
To Mr. D. Harkes, Knutsford, for his expanding Horse-hoe	5*l.*
To Mr. Garrett, Saxmundham, for his patent Horse-hoe	Siver Medal.
To Messrs. Saunders, Williams, and Taylor, Bedford, for their patent Harrows	5*l.*
IV.—Chaff-cutters, &c.	
To the Earl of Ducie, Dursley, for his Chaff-cutter	10*l.* and Silver Medal.
To Mr. Gardner, Banbury, for his Turnip-cutter	5*l.*
To Mr. Hornsby, Grantham, for his Cake-crusher	5*l.*
V.—Sundries.	
To Mr. D. Coombs, Barford, for his Oxfordshire Waggon	15*l.* and Silver Medal.
To Mr. Stratton, Bristol, for his Harvest cart	Silver Medal.
To Ditto, for his Agricultural spring-cart	Silver Medal.
To the Earl of Ducie, Dursley, for his Richmond Cart	Silver Medal.
To Mr. Stratton, Bristol, for his Water-cart	5*l.*
To Mr. Crosskill, for his Clod-crusher	20*l.*
To Mr. Hornsby, Grantham, for his Drill-presser	10*l.* and Silver Medal.
To Mr. John Reid, Regent Circus, Piccadilly, for his subsoil Pulveriser	10*l.*
To Mr. Cooch, Northampton, for his Barley hummeller	Silver Medal.
To Mr. Stratton, Bristol, for Gingell's Cheese-press	Silver Medal.
To Mr. Harkes, Knutsford, for his Churn	5*l.*
To Messrs. J. Hall and Co., Cambridge, for Constable's Trefoil and Clover-drawing machine	5*l.*
To Mr. J. Knight, Maidstone, for his patent Hop-kiln	5*l.*
To Mr. Stratton, Bristol, for Fry's Bone-breal e	2*l.*
To Mr. Deane, Birmingham, for his Hand-mill	Silver Medal.
Award of Premiums—continued.	
To Mr. Hill, Dudley, for his Cow-crib	2*l.*
To Mr. Garrett, Saxmundham, for Springall's Stack-stand	Silver Medal.
To Mr. Hill, Dudley, for his Sheep-fence	Silver Medal.
To the Earl of Ducie, Dursley, for Clyburn's Screw spanner	Silver Medal.
To Mr. Pearce, Andover, for his Back-band Tug	Silver Medal.
To Messrs. Tasker and Fowle, for their machinery for drawing water	Silver Medal.
To Mr. J. Reid, Regent Circus, Piccadilly, for his Fire-engine	5*l.*
To Messrs. Ransome, Ipswich, for their Horse-works with Bean-splitter, Chaff-cutter, and Linseed crusher	30*l.*
To Mr. Cambridge, Devizes, for his Steam-engine	5*l.*
To Messrs. Ransome, Ipswich, for their hand-drain, tile, and pipe machine	20*l.* and Silver Medal.

Rather than give a mere list of implements exhibited by the various machine-makers, which would not interest the generality of our readers, we have in the following statement singled out a few deserving of particular notice, enlarging at some length on their merits.

Ploughs.—We cannot give anything like a description of the very many implements of this class exhibited this year. The following remarks by the Judges, extracted from the Report of the Derby Show, apply equally to that at Southampton:—"They would particularise, as worthy of high commendation, those produced from the manufactory of Messrs. Ransome, composed entirely of iron and steel. The beams of these ploughs are constructed on the *truss* principle, which, though novel in its application to the plough, has long been appreciated by mechanics as possessing the greatest stiffness combined with lightness. It is this consideration which has induced those makers to abandon the use of wood, heretofore chiefly used by them for this part of the plough in preference to a beam of solid metal. The structure of their improved iron beam is such as to destroy lateral vibration, particularly at its root or junction with the body of the plough; it admits also of a neat and powerful fixing, as well as ready adjustment of the coulter. Tremor in mechanism is well known to consume power uselessly; and in the case of the plough, vibration in the beam, though it be insensible to the eye, renders the guidance of the implement more difficult, and its work less exact. The circumstance of increased stiffness attending mere weight of matter, may have been one cause why the heavier ploughs have not unfrequently been found to require less force of draught than lighter ones for an equal weight of soil moved; but stiffness is not incompatible with lightness, and a diminution in the weight of an implement, when perfect action is otherwise secured, must be attended with economy of power, or, what is the same thing, with a diminution of resistance, whence truer work results. It is also important that the stilts or handles should be stiff enough to transfer the effort of the holder to the body of a plough, with the least expenditure of his strength; for, the easier its guidance, the greater will be the certainty of the labourer's attention to his business. This property has also received the care of Messrs. Ransome, and, together with the simple means applied for adjusting and replacing the mould-boards, shares, and wearing parts of the various ploughs exhibited by them, testified to the thought and ability bestowed on the most minute details of an implement which still maintains its claim to be the most indispensable, as it was probably the earliest invented, auxiliary to human labour in tilling the soil."—Mr. Howard of Bedford, Messrs. Barrett and Exall of Reading, Messrs. Saunders and Williams of Bedford, and others, exhibited numerous implements in this class, with one, two, and without wheels. We select two, both of them turn-wrest Ploughs, as exhibiting much ingenuity. One of the best of this kind was exhibited by Mr. Comins of South Molton, Devon. We do not speak here of its efficacy as an agricultural implement, for we did not see it tested on the trial ground, but of the means of shifting the mould-board, share, and coulter at the land's end. This is all done by one simple operation: the implement has a double mould-board, so slightly curved as that each in succession answers the purpose of side-plate, while the other acts as turn-furrow. The under and upper side of the share are brought into action alternately, its edge being presented alternately right and left, according to the way the implement is working. The motions necessary to effect the change in the position of both mould-board and share, are obtained by shifting a lever, which rests on the handles, from one side of the Plough to another. This act gives the required half-revolution to the share, by means of a crank on a longitudinal shaft, lying in the body of the Plough, above the sole-plate to which the share is attached; and by means of a pinion upon this shaft working into rack-work, on a bar stretched between the mould-boards, this half-revolution at the same time effects the required alteration in the position of the turn-furrow.—The other Plough, that exhibited by Messrs. Ransome, named in the catalogue "Lowcock's Patent Plough," is also on the turn-wrest principle. Its body consists of two mould-boards, of a correctly-curved form, placed back to back, each with appropriate beam, share, and coulter. The two beams are connected by an iron rod, which runs the whole length of the implement, and along it the draught-bars and chains slide from one beam to the other when the horses turn at land's-ends. It will be seen that the plough does not turn; it is a completely double implement, either end working equally well. The two ploughs, of which, in fact, it consists, have handles which are common to each; and being hinged at the top of the implement, in the middle of its length, they are easily lifted over from one end to the other when necessary. In order, also, to shorten the implement, instead of having two complete mould-boards, back to back, the one is made to encroach, as it were, upon the other, so that the two would intersect, were it not that around the vertical line in which this intersection would take place a portion of a mould-board is made to rotate, one side of which fits, when in working position, to one mould-board, and the other to the other. The front curves of the mould-boards are counterparts of each other; while the hinder curves of the mould-boards are formed by a fly, which, turning on a centre, alternately presents the continuation of the curve of either the right or left mould-board, as required to be used. When the ploughman has completed the furrow turned to the right, he reverses the handles; at the same time the draught-chain, to which the horses are attached, is, by the act of their turning, carried on a rod to the opposite end of the plough. The fly on the mould-board, by its own pressure against the soil, assumes its correct position, and the implement is at once in order for turning the furrow to the left without further adjustment.—A premium of 5*l.* was awarded to a skim Plough, invented and manufactured by Mr. Bruce, of Teddington, Stratford-on-Avon. In addition to its similarity to the efficient implement exhibited by Mr. Hill, of Brierly Works, Dudley, which was rewarded at the Derby meeting, it possesses a very simple means of being raised or depressed in the ground, dependent for its action on a pressure applied to the handles.—A simple draining Plough, capable of cutting out a small drain, and laying the earth alongside of it, was exhibited by Mr. Harkes, of Mere, Knutsford, Cheshire.—Mr. Bruce exhibited a subsoil Plough, which was rewarded at Derby, and highly praised in the Report by the Judges of that meeting. The following description is extracted from the Derby report:—"The Show-yard contained implements having stirrers upon the plan of the Charlbury subsoil, *i. e.* affixed to the hinder part or heel of the plough. Mr. Bruce's contrivance is on a different, and it is thought a superior principle. He applies to the right hand side of his plough-beam, and about parallel with the point of the share, a frame containing two tines, adjustable as to width and depth, which, by means of a lever brought convenient to the ploughman, can be raised out of work at the land's-end, and set in again on the next bout with great readiness. The tines stand off from the beam so as to work to the depth of about 5 inches below the furrow-slice last turned, and thus loosen the soil previously trodden by the horses, leaving the slice also in no inconsiderable state of division. On trial, the action of the tines did not at all appear to derange that of the plough, or throw additional labour on the holder. The Judges have learned that this combination has been used and much approved by practical farmers in the inventor's neighbourhood. From observing the effect of this arrangement, it has been suggested to Mr. Bruce, that in certain soils, with the addition of Mason's knives, a very complete disintegration of the surface, as well as the loosening the subsoil, would be effected by the plough at one operation." In this instrument, as shown at Southampton, this suggestion has been attended to, probably, for we did not see it at work, with the best effect.

Scarifiers, Harrows, &c.—The Society's Prize of 10*l.* and a Silver Medal was awarded to the Earl of Ducie, for his seven-tined Uley Cultivator. This proved a most efficient implement in the trial-ground. In comparison with Biddle's Scarifier, of which several were exhibited by various makers, on the part of which Messrs. Ransome, of Ipswich, still contend that they manufacture the best scarifier, we think it possesses the advantages of a better and less-liable-to-choke arrangement of the teeth, and a better and more efficient form of the tooth as a stirrer and cleanser of the ground. Whether the means for raising and lowering the implement in the ground is practically inferior or superior to that adopted in Biddle's implement, we shall not venture to determine.—A parallel expanding Horse-hoe, exhibited by Messrs. Barrett and Exall, of Reading, presented a very simple adaptation of the principle of the parallel ruler. The advantage obtained in this case is the ability to employ curved teeth, which are far more efficient than those of the ordinary vertical form. This curved form cannot be used in implements having the ordinary radial method of widening, because in this case, if in any one position of the radial bar in which they are morticed, they face their work, then in any other position, when the machine is working at any other width, they will work sideways on, and so incur a liability to bend and break. Parallel expanding Horse-hoes were exhibited by the Earl of Ducie and other makers.—We did not see the Harrow which was exhibited last year at Derby, by Mr. Hopkin, of Ashbourne, Derbyshire. The following description is extracted from last year's Report:—"The Harrow is circular, like a cart-wheel, and lies flat on the ground, the tines passing through the felloes. A horizontal revolving motion is communicated to it, as it is drawn forwards, by means of an endless chain proceeding from a carriage in advance, and passing round a pully fixed upon, and concentric with, the rim of the Harrow, but of smaller diameter. The power is derived from the carriage-wheels, as in other cases. The execution of the apparatus was very imperfectly adapted to give effect to this novel idea, but the principle, perhaps, merits the attention of mechanics, as the double action, compounded of the progressive and circular movements, appeared to produce a very considerable comminution of the soil. Several circles of teeth may be inserted in the same wheel, and if it be found that the power used in giving the spinning or revolving motion be paid for in the quantity or quality of the effect, this construction might prove advantageous as a surface-pulveriser. The experi-

ment should be made with short small teeth." Improved as here suggested it would, we believe, prove an efficient implement.—A serrated chain or web Harrow, being an improvement upon that invented by Mr. Smith of Deanston, was exhibited by Messrs. Cottam and Hallen, of Winsley Street, London.

DRILL MACHINES.—We extract the following account of the origin and progress of drill machines from the Report of the Derby Show published in a late volume of the Society's Journal:—"The following concise history of the first introduction and progress of the manuring drill-system in Lincolnshire* has been obtained from sources on which it is believed full reliance may be placed; and its relation may have the effect of exciting the farmers of more backward districts to emulate those of a county excelled by none in Britain, in respect of the quantity of its produce, though far inferior to many in the natural fertility of its soil and character of its climate. The introduction of manure drills into Lincolnshire is comparatively of recent date. Previously to 1814, small single-row drills, attached to the plough for depositing Beans in every alternate furrow, and Turnip-seed drills, were the only seed-sowing machines used in the county. In 1814, the firm of Seaman and Hornsby, of Grantham, made a drill for depositing bones with Turnip-seed. In 1816 Mr. Gregory, of Nottingham, brought a sample of crushed bones to Grantham market, in a mahogany box, to exhibit to the farmers the perfection he had attained in reducing them to a small size. In the same year several spirited farmers purchased drills for bones. In 1817 these drills became general. In 1819 portable bone-mills were first introduced: these flourished but a short period, giving place to the large fixed steam-mills. In 1828 we first began to drill ashes mixed with bones. In 1839 originated the first attempt to improve the delivery of manure by means of stirrers in the drill-box; and by these improved machines the drilling of compost was effected. At present (1843) we presume to be able to deposit, by the drill, fold and stable-yard muck with our seed. For the rapid adaptation of the drill to this latter purpose we feel to be much indebted to the stimulus given to our mechanics by the Society. Neither Jethro Tull, the honoured father of the drill-system, nor the Rev. Mr. Cooke, the inventor of the Suffolk drill, dreamed of depositing manure of any kind with the seed; an addition which we consider to belong to the eastern counties' farmers, ambitious only at first to economise their then favourite manure, the bone. The Society's Prize of 30*l.* was awarded to Messrs. R. Garrett and Son, of Saxmundham, for their drill for general purposes. A mode of steerage was applied to this implement, which was thought to be calculated to render its use less difficult to novices, and to insure straightness in the lines. Facility in the guidance and management of these implements is a property of unquestionable importance, as providing for the more complete and safe action of the horse-hoe. It may not, however, be out of place to observe that experienced drillmen reject refined appliances of this kind as incumbrances. The late Earl of Leicester is said to have remarked that 'he would not employ a labourer who could not lead a drill horse straight from Holkham to St. Paul's.'"—Messrs. Garrett, of Saxmundham, received the Society's Prize of 20*l.* this year also, for their Drill for general purposes. Since last year, they had added an arrangement by which the opening between the manure-box and manure-drill, upon which the quantity thrown out depends, may be easily regulated as the machine proceeds. This object has been attained in a manner much simpler, and practically, we apprehend, equally efficient, in a drill exhibited by Mr. Woodbourne. Mr. Hornsby, of Grantham, Lincolnshire, who received the Society's Prize of 10*l.* and a Silver Medal for the best Drill Presser, exhibited a variety of efficient implements under this class, among which was a two-rowed Turnip Drill, which was probably the most efficient Manure Drill exhibited. The union of the traversing with the rotatory motion in the stirrers, for working pulverised manures, &c., down from the supply-box to the cups, which originated with this gentleman, was shown in several implements exhibited in the yard; but owing to its generally doing more than is wanted, and forcing the material out of the box faster than the cups can remove it, Mr. Hornsby has ceased to use it. If some simple means could be adopted for putting this apparatus easily and quickly out of gear at pleasure, as the machine proceeds, we think it would still be a useful attachment to the Manure Drill.—Mr. Newberry, of Chipping Norton, Oxon, exhibited his 4-wheel Dibbling Machine again. The efficiency of this implement has been amply demonstrated during the two seasons of Wheat-sowing in which it has been tried. A very favourable report by several practical farmers was given of this machine in a late volume of the Society's Journal. A field of Wheat near the trial ground had been sown by this machine, and was looking well.—Mr. Barnes's Drop Drill, manufactured at Nether Wallop, Hants, was constructed on a new principle. The intermittent nature of the delivery from this machine, both of the manure and seed, which constitutes its character as a drop drill, is obtained by means of an endless chain of tin cups, fastened at intervals of 9 inches on a revolving strap, these revolve in front of each coulter, each of the cups receiving a portion of the manure and seed supplied from their respective boxes, and descending, deposit their contents in succession on the ground as the machine proceeds, the motion of these straps being the same as that of the rim of the drill wheels, the seed is deposited at intervals of 9 inches in the rows, that being the distance of the cups from one another on the strap.—A Seed-Depositing or Planting Machine, exhibited by Mr. Henry Vingo, of Penzance, Cornwall, and another which had been previously exhibited at Bristol, acted on a principle peculiar to itself. The bottom of the seed-box was double, consisting of a fixed plate pierced at regular intervals, and a moveable one, also regularly fixed. The seed, it is evident, could only drop out of the box when these holes coincided; and by an arrangement, the motion of the under plate was regulated, so that this correspondence of the holes took place at regular intervals of time, producing an effect, in fact, somewhat similar to that of the drop drill. In one of these cases the motion of the under plate was a circular one, and in the other it had a reciprocating sliding motion.

THRESHING AND WINNOWING MACHINE.—Many threshing machines were exhibited by different makers, and a great variety of horse engines also, for connecting horse-power with them. In one of these a screw propeller was used for converting the horizontal rotatory motion of the horses into the vertical rotatory motion of the shaft connecting with the machine, *i. e.* the spur wheel on the vertical axle around which the horses walked was toothed obliquely into a worm on the aforesaid shaft. This simple arrangement was stated, though obviously erroneously, to lessen the power required to work the machine; the loss of power by it from friction must be very great.—A threshing machine on a new principle, invented by Messrs. Clyburn and Parsons, was exhibited by the Earl of Ducie. It consists of a revolving cone or beater, inclosed in an outer fixed concave case. The outer case is open work. The Corn is fed in at the smaller end of the concave case, and (by the difference in the velocity between the large and small end of the revolving cone or beater) the straw is carried rapidly to the larger end and discharged. The grain, as it is separated from the ear, is thrown through the trellis or open work, so that a complete separation takes place. The wind caused by the revolution of the beater is brought to operate upon the threshed grain, and blows out the greater portion of chaff; thus, at one operation, the threshing and first winnowing is performed.—Mr. Hornsby, of Grantham, exhibited a Winnowing Machine, to which was attached an admirable feed apparatus, capable of taking in and delivering regularly Grain and Chaff in the roughest condition. It consists simply of a peculiarly toothed roller, working in the bottom of a hopper. It is capable of chaffing Corn as it comes from the threshing machine, and dressing the same.—A Winnowing Machine, on an entirely original principle, demonstrating much ingenuity, was exhibited by the Earl of Ducie, Dursley, Gloucestershire, invented by Mr. Clyburn. The current of air was driven by means of an arrangement somewhat like the arm of a windmill, only that the radial arms of which it consisted were much more numerous, and twisted further round, so that, revolving as they did in a vertical plane, the air was caught by them at an angle, and propelled forward. A current of air, of a section equal to the surface of this arrangement of fans, was thus produced, and in the midst of this, a riddle, having a lateral oscillatory motion was placed; the Corn fell on this from a hopper above; the straw was separated and some of the Chaff blown off. All that passed the riddle was then collected in a very shallow hopper below the riddle, from the bottom of which it was again delivered up in a thin stream to the influence of the current of air. The double action of this current of air proved efficient as a Winnowing Machine.—A simple and apparently efficient Barley Hummeler, for which a Silver Medal was awarded, was exhibited by Mr. J. Cooch, of Harlston, near Northampton. To this implement was attached an endless chain of feeding buckets, for the purpose of lifting the grain from the floor, and throwing it into the machine—a useful attachment; for the efficiency of implements of this class depends much upon the regularity with which they are fed.

CAKE-CRUSHERS, TURNIP AND CHAFF-CUTTERS, &c.—The Society's Prize of 5*l.* was awarded to Mr. Hornsby, for the best Cake-crusher. Instead of having rollers with toothed surfaces, presenting the appearance, in fact, of a series of toothed wheels, strung, at short intervals, on a common axis, Mr. Hornsby covers his rollers with a series of *pointed* teeth, or short pinnacles of case-hardened metal, the teeth on one roller corresponding in position to the intervals between those on the other.—A good Corn-crusher was exhibited by the Earl of Ducie, which differed from other machines in being grooved neither in a line with the axis nor spirally. It has a large and small roller, with a series of grooves turned in each in the form of a V, and fitting each other, the sharp edge of the V penetrating the grain; while the velocity of the grooves varying, produce a grinding motion.—Mr. Gardner, of Banbury, Oxon, exhibited his simple and efficient Turnip-cutter again, and was rewarded with a Prize of 5*l.* Many unsuccessful attempts have been made to produce an implement which shall excel this in all the points which constitute the excellence of an agricultural implement, viz. cheapness, simplicity, and efficiency. One of the best attempts is that by Mr. Phillips, of Bristol, in which the knives which cut the different sides of the pieces as they come from the machine are detached from one another. In one of the implements of this class exhibited by Mr. Phillips, a cross-cutting apparatus was attached, which shortened the finger-shaped pieces, in which the Turnip is delivered, into pieces an inch and a half long.—The Society's Prize of 10*l.* and Silver Medal was awarded to the Earl of Ducie, for his Lordship's Chaff-cutter. This implement differs from all others of this class in wanting that intermittance which characterises the cutting operation of all other chaff-cutters. The cutters consist of thin blades or knives with serrated edges, coiled spirally round a cylinder, thus insuring a continuous drawing cut, and requiring less power to cut a given quantity of material. From the peculiar arrangement of the cutters, the inconvenience and delay attendant upon removing them for the purposes of sharpening is avoided; this is done by turning the cylinder the back way round, and advancing an emery grinder towards the cutters. A simple method is also adopted for changing the length of cut, which is done by shifting the strap from one pair of pulleys to another; there are three pair; thus, when the strap is upon the large pulley on the axis of the cutting cylinder, and the small one on the shaft that drives the feed-rollers, it will cut three quarters of an inch long, and shorter by a quarter of an inch in every other pair of pulleys.—A Chaff-cutter exhibited by Messrs. Barrett and Exall of Reading, possessed a very simple mode of regulating the length of the cut at the will of the workman. The length of cut depends upon the relation between the rapidity with which the knives are made to revolve, and that of the rate at which the material to be cut is passed through the box. Now these two motions in all chaff-cutters are connected with one another by wheel and pinion, &c., and the object to be attained is some simple and easy means of varying this connection so that the one motion, that of the knives, being constant, the other, that of the material to be cut, may vary. This is effected in the instance before us by means of a disc on the axis of one of the feeding-rollers, on the face of which, in radial lines or nearly so, several series of tappets or teeth are arranged in circles about the centre of revolution. A shaft whose motion depends on that of the knives, revolves in front of this disc, and by means of a moveable pinion working into the aforesaid tappets, communicates its own motion to it. If this pinion work into one of the outer circles, the angular motion of the disc, and therefore that of the feeding-rollers, will be slow, and the chaff cut will be fine; if, on the contrary, it works into one of the inner circles, the chaff cut will be coarse. This important point, the length of the chaff, can also be regulated in another way. Suppose a toothed wheel be substituted in the stead of this disc, and in place of the pinion, a moveable worm be slipped on the aforesaid shaft; several worms for working thus into the wheel may be employed, according to the coarseness of chaff required, one taking one tooth, another two teeth of the wheel at a time, and so on. The motion of the shaft being constant, that of the disc will thus vary, and, as before, our object will have been attained. This mode of working chaff machines was exhibited by several makers in the yard. We single out one, Mr. Ward's, of Stratford-on-Avon, because of several other peculiarities in the machine he exhibited. One of them consisted in a beautiful arrangement by which the feeding-rollers were stopped while the cut of the machine was being made. It is evident that the efficiency of the worm, in communicating a motion to the disc, into which it works, and thereby to the feeding-rollers, depends on the obliquity of its thread to the axis of the shaft on which it is wound. In the case before us, the worm is of such a form, that its action in causing the disc to revolve ceases during a portion of its revolution. Two cuts being made during one of its revolutions, the thread of the worm in the course of one circle round the shaft on which it is wound is at two places oblique to the axis of the shaft, there producing motion in the feeding-rollers, and twice at right angles to it, there ceasing to produce motion; it is at the two portions of the revolution, when the feeding-rollers are thus at rest, that the cuts are made. Mr. Ward's Chaff-machine is named "Guillotine," from the nature of the cut which it makes; the arrangement for this purpose is as follows:—By means of a crank on the fly-wheel axle, a reciprocating vertical motion is given to a framework, which acts in slides in front of and across the feed-box. In this framework, a two-edged knife, inclined at an angle of about 30 deg., is placed in a vertical plane. This knife cuts on its descent and ascent—its two edges coming into play alternately—the material protruded from the box between its motions. We have mentioned three modes of regulating the cut of chaff-machines.—A very simple arrangement, somewhat on the principle of the second kind, was shown in a machine exhibited by Mr. Gardener, of Banbury, Oxon. This implement had three knives, two of which were in action at once; and by means of a simple arrangement on this principle, the feeding rollers stopped while each cut was being made.—A good Chaff cutter, marked B, was exhibited by Messrs. Ransome, of Ipswich. It is made entirely of metal, and combines the best points of Messrs. Ransome's former machines, with some important improvements on them. These improvements consist in the facilities for changing the length of the cut by means of toothed wheels, and of further varying the lengths by shifting one knife without detaching it, thus doubling the length of each change. The rollers vary in distance, according to the feed; and, from their spiral form, they draw it at a uniform rate of motion. The presser plate has a peculiar motion on the axis of the upper roller, so that whether the feed be thick or thin, a sufficient pressure is always applied; and thus the cut is made clean without drawing the short straws. Two horses will work it well, and may be estimated to cut 10 cwt. of straw per hour into half-inch lengths.

OTHER IMPLEMENTS.—Mr. Grant, of Stamford exhibited his excellent Horse Rake, which has gained prizes at many Agricultural Shows, and is now pretty

* "The Judges have set on foot inquiries relative to the origin of manure-drills in the south-eastern counties, but have not yet succeeded in establishing the historical dates to their satisfaction."

well known. As an implement of this kind we must mention the Corn Gatherer exhibited by the Messrs. Ransome; it consists of three large rakes, each attached to a common axle, and as each becomes filled, a simple act on the part of the driver releases it from its rigid position, and another takes its place. Implements hitherto made for the above purpose have been difficult to unload, even with the application of great strength to lift them over the gathered heaps. The gatherer leaves its load at the will of the driver without being lifted up, and without disturbing the heap it gathers together; while one of a treble row of tines alternately begin to gather the swathe, when the previous working tines have finished their heap, the size of which is regulated as required for one or two fork's full. The implement now exhibited is for one swathe at a time, the horse walking by the side of the swathe. For light Corn in large fields, the gatherer is made for two swathes at a time, and for very light land Corn may rake all the land (except where the row is left), clean at the same time. The principle upon which it acts is applied to horse-drag rakes, and by which much larger rows are got together than can be done by lifting up the rake, and thus save much time in getting up rakings.—The Society's prize of 30*l.* was awarded to Messrs. Ransome, for a neat and concise arrangement of three important implements, viz. Chaff-cutter, Bean-mill, and Mill for bruising other Grain; these are all driven by one and the same horse-power, and are situated within the circle described by the horse in its revolution.—Mr. Crosskill exhibited his well-known Clod-crusher, which is superior to all other implements of the kind; it possesses the advantage, which the inventor has patented, of having every toothed wheel—of a series of which it in fact consists—slipped loosely on a circular axle. Each revolves in any case which requires it, independently of the others, and this not only diminishes the draught of the implement but makes it more efficient and easily turned at the land ends.—Many Waggons, Carts, Harvest-carts, &c., were exhibited by Mr. Stratton of Bristol, and Mr. Crosskill of Beverley.—The Society's Prize of 15*l.* and Silver Medal for the best Waggon was awarded to Mr. Coombes of Shipton, near Burford, Oxon. It consisted of two parts, either of which might be taken apart and used as a cart; as both ends of the Waggon were alike, and shafts could be slipped in at either end.—An excellent Churn, to which a prize of 10*l.* was awarded, was exhibited by Mr. Harkes of Mere, near Knutsford, Cheshire. This, which is an upright cylinder, contains within it two frameworks of beaters revolving on the same upright shaft, one within the other, but by means of a very simple arrangement of bevil wheels, above the implement, they are made to move in contrary directions, thus producing a most perfect commixture and agitation of any fluid in the barrel.—A great variety of Weighing Machines were exhibited by Messrs. James of Fish-street Hill, and Messrs. Cottam and Hallen of Winsley-street, London.—A variety of Draining-tile Machines, of various sizes and prices were exhibited by Mr. Etheridge, of 11, Furnival's Inn, London.—A Draining-tile machine on Etheridge's principle, possessing two cylinders for holding clay, so that one could be filling while the other was at work, was exhibited by Messrs. Barrett and Exall, of Reading.—A simple Level, to be used in draining operations, was exhibited by Mr. Bailey Denton, of Southampton; who also exhibited his Model Map in relief, of an estate, shown at Derby last year. The principle of this Level lies in the fact that the vertical line from the angle of an upright isosceles triangle, the extremities of whose sides rest on a horizontal plane, will bisect the angle contained by those sides, and any lowering of one leg will be attended by a corresponding displacement of the vertical line. The implement is thus in form a pair of compasses, the legs of which are fixed at a distance from each other of 5 feet, by means of a cross-bar. From the apex is suspended a plumb, and in one leg there is fixed a sliding-sight and vernier, while on the other there are cross-hairs. To use this instrument a person has only to send forward, to the spot where it is intended to bring out the drain, a stick with a paper fixed in it the exact height of the line of sight in the instrument from the ground level; he then, with the instrument adjusted by the plumb to a true level, raises or depresses the sliding-sight in one leg until the cross-hairs in the other cut the paper in the stick. From the vernier he will read the rise or fall (per 5 feet) which will enable him to set the shifting limb to a corresponding division in the index on the bar, to which the workmen will afterwards work the plumb line.—An excellent self-recording Dynamometer, was exhibited by the Earl of Ducie, invented and manufactured by Mr. Clyburn, Dursley, Gloucestershire. This instrument records on a roll of paper the distance which the plough or other implement may have passed over, and the weight necessary to draw it through all its variations. It consists of a right and left-hand spiral spring, placed one within the other, to economise room. When the power is applied, the springs are compressed, which gives motion to a rack and pinion that has a pulley fixed on the same spindle; this pulley has a chain passing round it which gives motion to a pencil and pointer, the pencil acting upon a roll of paper, each division in the length of which is twenty-five yards of ground passed over, and each division in the width is 112 pounds of force applied to the instrument; this paper has motion given to it from a pair of wheels which roll upon the ground, while the pencil is moved backward and forward according to the power applied, thus drawing a line on the paper, showing the draught and the distance passed over. It is impossible to suppose but that in the foregoing report of the Implement Show of Southampton, drawn up from a necessarily hurried examination, many valuable implements have been overlooked. Should this have been the case with anything possessing good claim to be classed as a *new* implement, we shall be happy to correct our error, on being supplied with the means of doing so.

Trial of Implements.—Towards noon on Tuesday those who had congregated in such numbers at the Implement yard, began to move off towards Swathling farm, on the Winchester-road, where ground had been secured for the trial of implements. This was not so much for the information of the Judges, who had already determined on the merits of the implements from a private trial of them on the previous day, as for that of purchasers and others anxious to judge for themselves in the matter. On reaching the ground, we found it extremely hard from the effects of the weather—unfit indeed to show the action of most implements. Various drilling-machines, cultivators, harrows, rollers, horse-hoes, &c., were tried in an adjoining field after the ploughing was over; some of them performed their work excellently well. Crosskill's clod-crusher—the land was just in condition for it—proved a most efficient implement. We shall not, however, describe this part of the trial, the more, because owing to the great confusion which prevailed, very little information could be gathered from an inspection of the work. In the other field 16 ploughs had started work; they were arranged as follows:—

No.	Character of Implement.	Name of Exhibitors.
1	Two-wheel Iron Plough	Mr. Hill, Brierly, Dudley.
2	One-wheel Plough	Messrs. Tasker and Fowle, Andover.
3	Swing Plough	Mr. Clyburn, Uley, Gloucestershire.
4	American Plough (Swing)	Messrs. Hughes, Norse, and Mason.
5	Eagle Swing Plough	
6	Two-wheel Plough, W.S.	Messrs. Saunders & Williams, Bedford.
7	One-wheel Plough	Mr. Clark, Romsey.
8	Wheel Plough, J. H.	Mr. Howard, Bedford.
9	Ditto, Ransome's, Y.D.	Messrs. Sims and Brown, Tollard Royal, Dorsetshire.
10	Ditto Ditto	Mr. Howard, Bedford.
11	Smart's Turn-rest Plough	Mr. Simmons, Sittingbourne.
12	One-wheel Plough	Messrs. Barrett and Exall, Reading.
13	Lowcock's Patent Turn-rest	Messrs. Ransome, Ipswich.
14	Wheel Plough, Y.M.	Ditto
15	Ditto, Y.O.	Ditto
16	Ditto, Y.L.	Ditto

When the skilfulness of ploughmen varies much, the performance of ploughs is not a perfectly accurate test of their efficiency; and in this case the land was extremely hard; the exhibition could not, therefore, be taken as fairly testing the implements tried. We find, however, from notes taken before ascertaining, except in one instance, the names of the implements, that their work was classifiable as follows in point of excellence; the figures refer to the above list:—

I. Nos. 6 and 10.
II. Nos. 7, 12, 13, and 16.
III. Nos. 1, 2, 8, 9, 11, 14, and 15.
IV. No. 3.
V. Nos. 4 and 5.

The wheel ploughs exhibited greatly superior work to the swing plough. There was much less difference between I. and II., and II. and III. than there was between III. and IV., and IV. and V. The performance of No. 3 was very poor compared with the others, and that of 4 and 5 was wretchedly bad. We must not forget to mention that close by the trial ground a field had been laid out in plots, each of which exhibited the effects of some particular manure on Rye-grass. The weather had been greatly against the trial, so that very little difference was apparent amongst them. That on which nitrate of potash had been applied appeared to be of the darkest colour; that on which oil-cake had been spread appeared to be rather the best of the number; while the plot to which farm-yard manure had been applied, differed from all the others in the number of weeds, chiefly Thistles, with which it was covered; thus singularly verifying the accuracy of Mr. Bernay's remarks in a late *Gazette*, on the inability of fermentation in manure to destroy the vitality of seeds contained in it.

On Wednesday, at 5 p.m., the Council dinner took place at the Victoria Archery Room. Nearly 400 gentlemen sat down. Lord Spencer, the President of the Society, was in the chair, and many noblemen among its chief supporters were on the platform.

After the usual loyal toasts, which were most heartily received, Lord Spencer stated that the Duke of Cambridge had been over the implement and cattle yard that morning, though unable to be at the dinner, and with reference to the latter place, he had to apologise for having broken one of the rules of the Society, his Royal Highness having gone through the yard while the Judges were still at work inspecting the animals, this being in direct contravention of a positive rule. This explanation was received with loud cheers. The next toast, "The Professors of Science," was proposed by Lord Ashburton, who, in the course of his remarks on the connexion between science and farming, or rather on the union of intellect and manual labour in the production of some of the most useful machines, stated that two, the earliest in use, and those on which most labour and thought had been expended—the ship, and the plough—were precisely those about the proper form of which we still remain in most doubt. In returning thanks for the hearty manner in which this toast was received, Dr. Buckland entered into considerable detail as to the capability of the Hampshire District of improvement. He said that many thousand acres of it were lying in a worthless condition—equally so with that of the barren mountain heaths of central and northern England—but that the insuperable difficulty in the way of the improvement of these, viz., want of a good climate, did not exist in the way of Hampshire improvers. The course of improvement to be followed by them, consists in carrying clay to the sandy soils, and chalk after drainage upon clayey soils; both of these materials are within the reach of the Hampshire farmer. The expense is from 5*l.* to 10*l.* per acre, but the improvement is certain and permanent—it will last for ever—no mismanagement on the part of the tenant can destroy it. Instances of this are frequent. Portions of Bagshot Heath and Ascot Heath have thus been converted into fertile land, and a case was mentioned of land in Ireland formerly worth 5*s.* an acre, now yielding, in consequence of this treatment, large crops of good Hay. Dr. Buckland then referred to guano, a natural manure existing in beds of such enormous thickness in many tropical islands, that to speak of it, fairly came within his province as a geologist. He spoke of the apparent failure of that and most other concentrated manures this year, in consequence of the dry weather, and advised agriculturists to let all their this year experiments go for nothing, and not be deterred from trying guano largely next year, when it would certainly be much cheaper, as upwards of 60,000 tons of shipping were already at sea in that trade.—The award of premiums for cattle, &c., was then read by Lord Spencer. We give it below entire, although the award for horses was not read on that occasion, as, stallions being removed from the yard every night, would of course not be brought back again for exhibition on the Thursday, if it became known to whom the prizes had been awarded.

AWARD OF PREMIUMS.

Prizes for Improving the Breed of Cattle, 1844.

Short-Horns.

Class 1.—To the owner of the best Bull calved previously to the 1st of January, 1842, *Thirty Sovs.*, awarded to Mr. John Cooper, of Bonkwood, Thargarton, Southwell, Notts, for his Short-horned Bull, 3 years, 1 month, and 13 days old, bred by himself.

To the owner of the 2d best ditto ditto, *Fifteen Sovs.*, awarded to Mr. Hayter, M.P., of Wells, Somerset, for his Short-horned Bull, 2 years and 10 months old, bred by Mr. Unsworth, of Blackrod, Lancaster.

2. To the owner of the best Bull, calved since the 1st of Jan., 1842, and more than one year old, *Twenty Sovs.*, awarded to Mr. W. Foulds, of Kirklington, near Southwell, Notts, for his Short-horned Bull, 2 years, 3 months, and 22 days old, bred by Mr. Milward, of Hexgrove Park, Southwell.

3. To the owner of the best Cow in milk, *Fifteen Sovs.*, awarded to Mr. John Booth, of Killerby, Catterick, Yorkshire, for his Short-horned Cow, 3 years, 2 months, and 5 days old, bred by himself.

4. To the owner of the best in calf Heifer, not exceeding 3 years old, *Fifteen Sovs.*, awarded to his Grace the Duke of Devonshire, of Chatsworth, Bakewell, Derbyshire, for his Short-horned Heifer, 2 years and 5 months old, bred by Mr. Watson, of Walkeringham, Bawtry, Yorkshire.

5. To the owner of the best Yearling Heifer, *Ten Sovs.*, awarded to Mr. R. Booth, of Warlaby, Northallerton, Yorkshire, for his Short-horned yearling Heifer, 1 year, 2 months, and 3 weeks old, bred by himself.

Herefords.

Class 1.—To the owner of the best Bull calved previously to the 1st of January, 1842, *Thirty Sovs.*, awarded to Mr. W. Perry, of Monkland, Leominster, for his Hereford Bull, 2 years, 7 months, and 28 days old, bred by himself.

To the owner of the 2d best ditto ditto, *Fifteen Sovs.*, awarded to Mr. G. Brown, of Avebury, Wilts, for his Hereford Bull, 2 years and 7 months old, bred by himself.

2. To the owner of the best Bull, calved since the 1st of Jan., 1842, and more than one year old, *Twenty Sovs.*, awarded to Mr. J. N. Carpenter, of Eardisland, near Leominster, Hereford, for his Hereford Bull, 1 year, 8 months, 3 weeks, and 4 days old, bred by himself.

3. To the owner of the best Cow in milk, *Fifteen Sovs.*, awarded to Mr. G. Drake, of the Manor Farm, East Tytherley, Stockbridge, Hants, for his pure Hereford Cow, 8 years and 10 months old, bred by Mr. Price, of Pool House, Upton-on-Severn.

4. To the owner of the best in-calf Heifer, not exceeding three years old, *Fifteen Sovs.*, awarded to Mr. J. N. Carpenter, of Eardisland, near Leominster, Herefordshire, for his Hereford In-calf Heifer, 2 years, 8 months, and 18 days old, bred by himself.

5. To the owner of the best Yearling Heifer, *Ten Sovs.*, awarded to Mr. J. Walker, of Burton, near Worcester, for his Hereford Yearling Heifer, 1 year and 8 months old, bred by Mr. C. Walker, of Sutton.

Devons.

Class 1. To the owner of the best Bull, calved previously to the 1st of January, 1842, *Thirty Sovs.*, awarded to Mr. Geo. Turner, of Barton, near Exeter, for his Devon Bull, 2 years and 8 months old, bred by himself.

To the owner of the second best ditto ditto, *Fifteen Sovs.*, awarded to Mr. Thomas Nurcombe, of Hopcott Farm, Minehead, Somerset, for his pure Devon Bull, 4 years and 9 months old, bred by himself.

2. To the owner of the best Bull calved since the 1st of Jan., 1842, and more than one year old, *Twenty Sovs.*, awarded to Mr. T. Reynolds, of Raddon Court, Thoverton, Exeter, for his pure North Devon Bull, 2 years and 5 months old, bred by Mr. A. Parsons, of Lifton, Devon.

3. To the owner of the best cow in milk, *Fifteen Sovs.*, awarded to Mr. G. Turner, of Barton, Exeter, for his Devon Cow, 6 years and two months old.

4. To the owner of the best in-calf Heifer, not exceeding three years old, *Fifteen Sovs.*, awarded to Mr. G. Turner, of Barton, near Exeter, for his Devon In-calf Heifer, 2 years and 2 months old.

5. To the owner of the best Yearling Heifer, *Ten Sovs.*, awarded to Mr. James Hole, of Knowle, near Dunster, Somerset, for his Devon Yearling Heifer, 1 year, 7 months, and 2 days old, bred by himself.

Cattle of the Channel Islands Breed.

Class I. To the owner of the best Bull calved previously to the 1st of Jan., 1843, *Fifteen Sovs.*, awarded to Mr. W. J. G. Phinips, of Eling Vicarage, Southampton, for his Channel Island Bull, 2 years and 4 months old, bred by himself.

2. To the owner of the best Bull calved since the 1st of Jan., 1843, and more than one year old, *Ten Sovs.*, awarded to Mr. W. B. Gater, of West End, Southampton, for his Channel Island Bull, 2 years and 5 weeks old, bred by Mr. W. Gibbs, of Itchener, Sussex.

3. To the owner of the best Cow in milk, *Ten Sovs.*, awarded to Mr. C. W. Robin, of Petit Minage, St. Helier, Jersey, for his pure Jersey Cow, 2 years and 6 months old, bred by Mr. J. Hocquard, of Granville, Jersey.

4. To the owner of the best in-calf Heifer, not exceeding two years old, *Ten Sovs.*, no competition.

5. To the owner of the best Yearling Heifer, *Seven Sovs.*, awarded to Mr. John Hume, of Beau Regard, St. Helier, Jersey, for his pure Jersey yearling Heifer, 1 year, 1 month, and 10 days old, bred by Major Bridgeham, of St. Laurens, Jersey.

CATTLE OF ANY BREED, OR CROSS;

Not qualified to compete in the foregoing classes.

CLASS 1.—To the owner of the best Bull calved previously to the 1st of January, 1842, *Thirty Sovs.*, awarded to Mr. W. Brine, of Tolpuddle, near Dorchester, for his pure long-horned Bull, 4 years and 5 months old, bred by the late Mr. Thomas Wyatt, of Hanwell Park, near Banbury.

To the owner of the second best ditto, *Fifteen Sovs.*, awarded to Mr. Thomas Jenner, of Cowdray Park Farm, Petworth, Sussex, for his pure Sussex Bull, 3 years and 4 months old, bred by himself.

2. To the owner of the best Bull calved since the 1st of Jan., 1842, and more than one year old, *Twenty Sovs.*, awarded to Mr. Thomas Dowden, of Mitcheldever, Andover Road, Hants, for his Hereford and Durham Bull, 2 years and 2 months old, bred by himself.

3. To the owner of the best Cow in milk, *Fifteen Sovs.*, awarded to the Hon. M. W. B. Nugent, of Higham Grange, Hinckley, Leicestershire, for his pure Leicester or long-horned Cow, 10 years and 2 months old, bred by Mr. Ball, of Smowford Lodge, Long Ickington, Southam, Warwickshire.

4. To the owner of the best in-calf Heifer, not exceeding three years old, *Fifteen Sovs.*, awarded to the Hon. M. W. B. Nugent, of Higham Grange, Hinckley, Leicestershire, for his pure Leicester or long-horned in-calf Heifer, 3 years and 11 days old, bred by himself.

5. To the owner of the best Yearling Heifer, *Ten Sovs.*, awarded to Mr. W. J. Calhoun, of Binderton, near Cheshire, for his short-horned and Hereford yearling Heifer, 1 year and 2 months old.

HORSES.

CLASS 1.—To the owner of the best Stallion for Agricultural Purposes, of four years old and upwards, *Thirty Sovs.*, awarded to Mr. Thomas Catlin, of Butley, Woodbridge, Suffolk, for his Cart Stallion, 4 years old, bred by himself.

To the owner of the second best ditto ditto, *Twenty Sovs*, awarded to the Right Hon. the Earl of St. Germans, St. Germans, Cornwall, for his aged Cart Stallion.

2. To the owner of the best two years old ditto, foaled since the 1st of Jan., 1842, *Fifteen Sovs*, awarded to the Right Hon. Lord St. John, of Melchbourne, Kimbolton, for his Cart Stallion, 2 years and 2 weeks old, bred by his lordship.

3. To the owner of the best Mare and Foal for agricultural purposes, *Twenty Sovs.*, awarded to Mr. W. Fowle, of Market Lavington, Devizes, Wilts, for his Cart Mare and Foal; sire of foal belonged to Mr. H. Ings, Penzelwood, Somerset.

To the owner of the second best ditto, *Ten Sovs.*, awarded to Mr. G. W. Roberts, of King's Walden, Hitchen, Herts, for his Cart Mare and Foal; mare bred by himself: sire of foal belonged to Mr. Hayden, of Arrington, Cambridge.

4. To the owner of the best two-years-old Filly for agricultural purposes, *Ten Sovs.*, awarded to Mr. W. Fowle, of Market Lavington, Devizes, for his 2-year-old filly, bred by Mr. R. Daintree, of Hemmingford Abbotts, near St. Ives, Hunts.

5. To the owner of the best Thorough-bred Stallion, which shall have served mares at a price not exceeding three guineas, (and with a groom's fee of not more than five shillings,) in the season of 1844, *Thirty Sovs.*, awarded to Mr. R. Curtis, of Basingstoke, for his thorough-bred stallion, 5 years old; was got by Langar, dam by Cervantes, out of Maruana, by Selim.

SHEEP.

Prizes for Improving the Breed in Sheep: 1844.

LEICESTERS.

CLASS 1. To the owner of the best Shearling Ram, *Thirty Sovs*, awarded to Mr. J. G. Watkins, of Woodfield Ombersley, Stourport, Worcestershire, for his pure Leicester Ram, 17 months old, bred by himself.

To the owner of the second best ditto, *Fifteen Sovs.*, awarded to Mr. T. E. Pawlett, of Beeston, Biggleswade, Beds, for his Leicester Ram, 15 months old, bred by himself.

2. To the owner of the best Ram of any other age, *Thirty Sovs.*, awarded to Mr. T. E. Pawlett, of Beeston, Biggleswade, Beds, for his Leicester Ram, 28 months old, bred by himself.

To the owner of the second best ditto. *Fifteen Sovs.*, awarded to Mr. T. E. Pawlett, of Beeston, Biggleswade, Beds, for his Leicester Ram, 40 months old, bred by himself.

3. To the owner of the best pen of five Shearling Ewes, *Ten Sovs*, awarded to Mr. J. G. Watkins, of Woodfield, Ombersley, Stourport, for his pen of five pure Leicester Shearling Ewes, bred by himself.

To the owner of the second best ditto ditto, *Five Sovs.*, awarded to Mr. John Beasley, of Chapel Brampton, Northampton, for his pen of five improved Leicester Shearling Ewes, 16 months old, bred by himself.

SOUTHDOWN SHEEP.

CLASS 1. To the owner of the best Shearling Ram, *Thirty Sovs.*, awarded to Mr. Jonas Webb, of Babraham, Cambridge, for his Southdown Ram, 16 months old, bred by himself.

To the owner of the second best ditto, *Fifteen Sovs.*, awarded to his Grace the Duke of Richmond, of Goodwood, Chichester, Sussex, for his Southdown Ram, 16 months old, bred by his Grace.

2. To the owner of the best Ram of any other age, *Thirty Sovs.*, awarded to Mr. J. Beaven, Jun., of Gore Farm, Market Lavington, for his Southdown Ram, 52 months old, bred by himself.

To the owner of the second best ditto, *Fifteen Sovs.*, awarded to Mr. T. Ellman, of Beddingham, Lewes, Sussex, for his Southdown Ram, 27 months old, bred by himself.

3. To the owner of the best pen of Five Shearling Ewes, *Ten Sovs.*, awarded to His Grace the Duke of Richmond, of Goodwood, Chichester, for his pen of five Southdown Shearling Ewes, 16 months old, bred by his Grace.

To the owner of the second best ditto ditto, *Five Sovs.*, awarded to Mr. D. Barclay, M.P., of Eastwick Park, Leatherhead, Surrey, for his pen of five Southdown Shearling Ewes, 17 months old, bred by himself.

LONG-WOOLLED SHEEP:

Not qualified to compete as Leicesters.

CLASS 1.—To the owner of the best Shearling Ram, *Thirty Sovs.*, awarded to Mr. C. Large, of Broadwell, Burford, Oxon, for his new Oxfordshire Ram, 16 months old, bred by himself.

To the owner of the second best ditto, *Fifteen Sovs.*, awarded to Mr. C. Large, of Broadwell, Burford, Oxon, for his new Oxfordshire Ram, 16 months old, bred by himself.

2. To the owner of the best Ram of any other age, *Thirty Sovs.*, awarded to Mr. E. Handy, of Sevenhampton, Andoverstord, Gloucestershire, for his improved Cotswold Ram, 40 months old, bred by himself.

To the owner of the second best ditto, *Fifteen Sovs.*, awarded to Mr. E. Handy, of Sevenhampton, Andoverstord, Gloucestershire, for his improved Cotswold Ram, 40 months old, bred by himself.

3. To the owner of the best pen of five Shearling Ewes, *Ten Sovs.*, awarded to Mr. E. Smith, of Charlbury, Oxon, for his pen of new Oxfordshire Long-woolled Ewes, 16 months old, bred by himself.

To the owner of the second best ditto ditto, *Five Sovs.*, awarded to Mr. James Linton, of Henningford Abbotts, St. Ives, Hunts, for his pen of five Lincoln and Leicester Ewes, 16 months old, bred by himself.

SHORT-WOOLLED SHEEP:

Not qualified to compete as South Downs.

CLASS 1.—To the owner of the best Shearling Ram, *Twenty Sovs.* Prize withheld for want of merit.

2. To the owner of the best Ram of any other age, *Twenty Sovs*, awarded to Mr. Thomas Hutton, of Upton Gray, Odiham, Hants, for his Hampshire Down Ram, 29 months old, bred by himself.

3. To the owner of the best pen of Five Shearling Ewes, *Ten Sovs.*, awarded to Mr. W. Humphrey, of Chaddleworth, Newbury, Berks, for his pen of five Berkshire Short-woolled Ewes, 18 months old, bred by himself.

PIGS.

CLASS 1.—To the owner of the best Boar of a large breed, *Ten Sovs.*, awarded to Lieut.-Colonel Thornhill, of New Park, Lyndhurst, Hants, for his Boar, 36 weeks old, bred by Mr. W. P. Thornhill, of Stanton, Bakewell, Derbyshire.

To the owner of the 2d best ditto ditto, *Five Sovs*, awarded to Mr. Pusey, M.P., of Pusey, Faringdon, Berks, for his Berkshire Boar, 2 years and 1 month old, bred by Mr. J. Harris, of Hinton.

2. To the owner of the best Boar of a small breed, *Ten Sovs.*, awarded to Mr. W. F. Hobbs, of Marks-hall, Kelvedon, Essex, for his improved Essex Boar, 10 months old, bred by himself.

To the owner of the 2d best ditto ditto, *Five Sovs.*, awarded to the Rev. W. Hocken, of St. Endallion, near Camelford, Cornwall, for his improved Essex Boar, 27 weeks and 3 days old, bred by himself.

3. To the owner of the best breeding Sow of a large breed, *Ten Sovs.*, awarded to Mr. P. Pusey, M.P., of Pusey, Faringdon, Berks, for his Berkshire Sow, 1 year and 8 months old, bred by Mr. J. Blandy, of Kingston, Berks.

4. To the owner of the best breeding Sow of a small breed, *Ten Sovs.*, awarded to Mr. A. P. Falconer, of Beacon Hordle, Christchurch, Hants, for his Yorkshire Sow, 11 months and 3 weeks old, bred by Mr. J. W. Nutt, York.

5. To the owner of the best pen of three breeding Sow-Pigs, of the same litter, above four and under nine months old, *Ten Sovs.*, awarded to Mr. Joseph House, of Bestwall, near Wareham, Dorset, for his pen of three Dorsetshire Sow-Pigs, 34 weeks old, bred by himself.

Shortly after reading the above award, the company separated.

A Public Meeting for the purpose of establishing an Agricultural College was held this day at the Freemasons' Hall, at 2 o'clock. The attendance was not numerous, as most of the agricultural visitors were engaged at the implement-yard. What, however, the meeting lacked in point of numbers was made up by the great respectability of the parties present, among whom were the Duke of Richmond, Lord Ducie, Mr. Pusey, M.P.; Mr. Escott, M.P., Oxford; Mr. Goddard, Drs. Buckland, Daubeny, and Playfair.—The chair was taken by Mr. Pusey, who stated the object of the meeting, and pointed out the advantage that would accrue to the agriculturist from the establishing such a College. The project had been taken up by many of the leading agriculturists, not only in the immediate district in which it was intended to establish the College, but in other counties. Lord Bathurst had, in addition to providing a suitable farm of 400 acres, on which the College and other buildings were to be erected, advanced 2000*l.* in furtherance of the object.—The Duke of Richmond, in proposing the first resolution, said that he had declined to take shares in the proposed Society, upon the principle that every shareholder should have time to attend to the details of the Society to which he had put his name, so that by so doing he might not mislead others to add their names, upon the faith of seeing his name, and thereby supposing that he would attend to its practical operations. He would avoid that evil, as he was aware that his many other avocations would prevent him from giving sufficient attention to the details. He, however, so highly approved of the Society, that although he could not become a subscriber for the reason he had stated, yet he most gladly gave a donation to promote its establishment. He would not have the Committee be too sanguine of making any profit from the farm. He was a farmer himself, and he was aware that farming was not so profitable as most other pursuits. He was of opinion that Schools of Agriculture were much wanted in the country, and he had great pleasure in proposing the first resolution (which was seconded by Dr. Playfair):—"That Schools of Agriculture are much wanted in this country, in which a knowledge of the sciences now admitted to be essential to the successful pursuit of Agriculture may be learned, in connection with the practical working of a farm on the most approved principles."—Mr. Escott proposed the second resolution, and said that he gladly availed himself of joining a meeting that had so important an object in view. He, in common with many other persons, had long deplored the want of a proper establishment for the education of the agricultural population in pursuits adapted to their after life. A most important fact was developed and published by the agriculturists themselves, as the wish to establish a College originated from a Farmers' Club. The object of the meeting had his most cordial support, and he moved the following resolution (which was seconded by Mr. N. Goddard):—"That the plan for the establishment of an Agricultural College near Cirencester, explained by the deputies attending that meeting, is calculated to effect that desirable object."—The next resolution was to have been proposed by Lord Spencer, but the Duke of Richmond explained to the meeting that that nobleman was unavoidably absent, in consequence of being in attendance on his Royal Highness the Duke of Cambridge, who was inspecting the Show-yard. In the absence of Lord Spencer, Dr. Buckland proposed, and Mr. Eyle seconded the resolution, "That this meeting warmly recommends the agricultural community to give every support and encouragement to the establishment of the College, which they regard as the first step in the right direction for training up the rising generation of farmers upon a sound foundation; and they would especially urge on farmers generally the importance of securing to their children, intended for the same occupation, the great advantages to be derived from the kind of education provided by such an institution."—The Duke of Richmond proposed, and Dr. Daubeny seconded a vote of thanks to Mr. Pusey for the service he had rendered to the agriculturists generally, and for his conduct in the chair.—Mr. Pusey briefly replied, and congratulated the meeting upon the object they had in contemplation being fully carried out, when they saw the noblemen present, and the member for the University of Oxford, as well as two of the distinguished professors, come forward to take them by the hand.

On THURSDAY the Cattle Yards were opened at six o'clock in the morning, and very soon began to fill. Towards noon there must have been many thousands within them. It is unnecessary to say much respecting the character of this Exhibition. There was an excellent show of Hereford and Devon cattle, which mustered in much greater numbers than the Short-horns. The show of South Downs among the sheep was also much the finest part of the Exhibition under this head. There was a good show of pigs; some of the Essex breed, exhibited by Mr. F. Hobbs, of Kelvedon, were extraordinarily fat. It is impossible to speak too highly of the general arrangements of the Show Yard, for which the Society is indebted to Mr. B. Gibbs. Notwithstanding the immense number of people within the Yard, and the immense number of cattle and sheep, &c., requiring food and attendance, everything proceeded without the least jar or confusion. Admirably arranged catalogues were to be had, containing a reference to everything in the Yard, so that a visitor could easily and without waste of time find what he wished to examine.

The Dinner of the Members of the Society took place in the evening, in the Pavilion erected for the purpose. The chair was taken by Lord Spencer at 4 P.M.; from 1200 to 1400 gentlemen must have been present. We are unavoidably compelled to give our readers, in this No. of the *Gazette*, but a meagre report of the proceedings at this interesting meeting. We select for report, the speeches connected with one of the many toasts of the evening—the motto of the Society, "Practice with Science," which was proposed by Lord Portman, and responded to by Dr. Playfair, in the absence of Prof. Daubeny. His lordship, in the course of his speech, illustrated the importance to agriculture, of well-conducted experiments, and the difficulty, though accurately performed, of deducing correct inferences from them. Of what use would it be to farmers then present, were he to detail to them experiments he had performed, connected with most important branches of agriculture, if he withheld information upon which, no less than upon the special forces he might have put in action, their results had depended?—he alluded to information on his soil, climate, his accessibility to manure, his supply of labour, &c. In responding to this toast, Dr. Playfair observed, that it was a sign of the present time, that in agriculture, as had been the case in medicine, people were beginning to trace out causes, and not merely look at their effects. Let us hope that in agriculture, as has been the case in medicine, the most beneficial results may flow from this system. He stated that the efforts of scientific men in this cause, had been productive of good within the still short period of the Society's existence. One instance of this was the success of their endeavour to bring guano into notice as a fertilising manure. At the time of the Liverpool Meeting, a single ship-load had been imported, with much anxiety as to the result, on the part of those interested in the speculation. Now, 60,000 tons of shipping were abroad to supply the demand for this article alone. Dr. Playfair then gave a curious instance of the manner in which the *dicta* of scientific men, being wrongly apprehended by the unlearned, become injurious instead of beneficial. An article was sold some time ago under the name of Dr. Daubeny's sulphate of ammonia, which, on examination, was found to be wholly innocent of any trace of ammoniacal salts. The Professor had recommended the mixture of gypsum with gas-water, the natural effect of which is to produce a solution of sulphate of ammonia, and cause a deposit of carbonate of lime. The ignorant manufacturer had retained the chalk, selling it as sulphate of ammonia, and thrown away the water containing all the ammoniacal salt that was present. It was as if the dairyman, in the manufacture of cheese, had kept the whey and thrown away the curd. Dr. Playfair then remarked on the enormous adulteration of which many manures were susceptible, without betraying it externally; and he stated that the cause of many of the contradictory results obtained from the use of manure might be traced to this fact—that manures of different kinds and intensities were thus frequently sold under a common name, while in point of fact they were as different from one another as possible. We shall probably report at additional length the proceedings of this meeting in our next.

Towards evening on this day the weather, which had been warm and clear throughout the week, changed. Rain, however, did not fall till fine weather, so far as the exhibitions and proceedings of the Society were concerned, was no longer in the least required.

FARMERS' CLUBS.

Bromsgrove.—At the annual meeting of this Club, Mr. Smith, of Deanston, delivered an instructive practical lecture on Thorough-Draining. Mr. Smith observed that water on land had two origins — that which was caused by springs from the earth beneath, and that which fell from the clouds in the shape of rain: and he had found from experience that it was better that this water should be drained away a certain depth beneath

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s*. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

BRIGHT'S CUSTARD COMPOUND. — The ORIGINAL VEGETABLE PREPARATION, for making custards without eggs. Patronised by the Royal family, Nobility, and Gentry, with the approval and testimony, amongst many others, of the COOKS to SIX CROWNED HEADS. Sold in boxes at 1*s*. and 4*s*. each. Manufactory, 5, Holland-street, North Brixton, Surrey. Wholesale of all respectable houses, and retail of by upwards of 1000 chemists, confectioners, grocers, Italian Warehousemen, &c., throughout the United Kingdom. Caution—Beware of imitations, and observe on all sent out the signature of the Inventor, JOHN BRIGHT.

STATE LOAN of His Royal Highness the Grand Duke of Baden of 5,000,000 fls., to be reimbursed with 9,034,055 fls., in lots of 50,000, 40,000, 35,000, 30,000, 20,000 fls., &c., the smallest being 50 fls.—GRAND PUBLIC DISTRIBUTION to take place at Carlsruhe on the 1st of August next; official bulletins containing the result will be forwarded immediately to every shareholder. Price of a single certificate, 10*s*.; 11 for 5*l*.; 23 for 10*l*.; 60 for 25*l*. sterling; payable in notes, money orders, or remittances.—Apply for full particulars and certificates, without delay, to Moriz I. Stiebel, banker, Frankfort-on-Maine. To save postages, all letters addressed to Messrs. Stiebel and Co., 8, Lime-street, London, will be promptly forwarded and attended to.

THE BEST ENGLISH WATCHES.—A. B. SAVORY and SONS, Watch makers, 9, Cornhill, London, opposite the Bank, request the attention of purchasers to their stock of London-made PATENT LEVER WATCHES, which are manufactured by themselves, in their own house. In silver cases, with the detached escapement and jewelled, the prices are four and a half guineas, six, and eight guineas each; or in gold cases, 10, 12, 14, and 16 guineas each. The very large stock offered for selection includes every description, enabling a customer to select that which is more particularly adapted to his own use.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s*. 9*d*. per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each BOX. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London. — Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Galley Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5*s*., 10*s*., 20*s*., 50*s*., and 100*s*. each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1*l*. to 5*l*. per annum; mansions and estates from 10*l*. and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and sea "Joseph Anton Meyer"

MR. HOARE'S NEW WORK ON THE VINE:
This Day is published, 12mo. 5*s*. cloth,
A DESCRIPTIVE ACCOUNT OF A NEW METHOD of PLANTING and MANAGING the ROOTS of GRAPE VINES. By CLEMENT HOARE, Author of "A Treatise on the Cultivation of the Grape Vine on Open Walls."
London: Longman, Brown, Green, and Longmans.

MAVOR'S SPELLING-BOOK.
THE ONLY GENUINE EDITION.
With the Author's final Corrections and Improvements.
Messrs. Longman and Co. respectfully acquaint Booksellers and Conductors of schools, that they have just published the 451st edition of Mavor's Spelling-Book, with the various revisions and improvements of Dr. Mavor. New types have been cast for it, and it is also illustrated by a Frontispiece, after Stothard, and Forty-four beautiful Wood Engravings, designed expressly by Harvey, which render this edition of Dr. Mavor's long-established and superior Spelling-Book the most attractive of any in existence.
London: LONGMAN, BROWN, GREEN, and LONGMANS.
Sold by all Booksellers in Town and Country.

CROCKER'S LAND-SURVEYING IMPROVED.
Just published, post 8vo., with very numerous Diagrams, a Field-book, Plans, &c. &c. 12*s*. cloth,
CROCKER'S LAND-SURVEYING.—New Edition, corrected throughout and greatly improved, by T. G. BUNT, Land Surveyor; with Tables of Six-Figure Logarithms, superintended by R. FARLEY, of the Nautical Almanac Establishment.
The LOGARITHMS, separately, 4*s*. 6*d*. cloth.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

NESBIT'S MENSURATION IMPROVED.
Published this Day, 12mo, 6*s*. bound,
A TREATISE on PRACTICAL MENSURATION, containing the most approved Methods of Drawing Geometrical Figures; Mensuration of Superficies; Land Surveying; Mensuration of Solids; the Use of the Carpenter's Rule; Timber Measure, in which is shown the Method of Measuring and Valuing standing Timber, Artificers' Works illustrated by the Dimensions and Contents of a House; a Dictionary of the Terms used in Architecture, &c. By A. NESBIT. Twelfth Edition, enlarged and greatly improved, with nearly 700 Practical Examples, and nearly 300 Woodcuts.—KEY. Seventh Edition, 12mo, 5*s*. bound.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

HAND-BOOKS FOR THE PEOPLE.
THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2*s*. cloth, a New and Enlarged Edition.
THE HAND-BOOK OF BOTANY;
Or Linnæan Lessons on Common Plants, for Field and Garden Practice. Price 2*s*.
THE HAND-BOOK OF AGRICULTURE;
Chiefly for the use of those interested in the Allotment System. Price 1*s*. 3*d*.
THE HAND-BOOK OF COOKERY;
Intended for the use of the Middle Classes. Price 2*s*. cloth.
THE HAND-BOOK OF THE TOILETTE;
Having in view the union of Bodily Health with Beauty of Person. Price 2*s*. cloth.
THE HAND-BOOK OF THE LAUNDRY;
Expressly intended for those who "wash at home." Price 1*s*. 9*d*.
THE HAND-BOOK OF MEDICINE;
Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2*s*. cloth.
THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1*s*. 9*d*.

Bound in cloth, price 5*s*. 6*d*.
JOE MILLER'S JEST-BOOK.
A Reprint from the first and genuine Edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.
Extract from the Preface.
"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."
London: WHITTAKER and Co.

Now ready, price 4*s*. 6*d*.,
RURAL CHEMISTRY.
By EDWARD SOLLY, Esq., F.R.S.,
Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry, at the Royal Institution.
&c. &c. &c.
Extracts from the Introduction:—
"A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act, and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."
"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

London: 5, Charles-street, Covent-Garden; and may be ordered of all Booksellers.

JUST PUBLISHED.
Second Edition, Revised, with Introductory Comments upon certain Criticisms that have appeared on the Work,
In two volumes, post 8vo, with Eight Portraits, price 24s., cloth,

A NEW SPIRIT OF THE AGE.

Containing CRITICAL ESSAYS and BIOGRAPHICAL SKETCHES of LITERARY and other EMINENT CHARACTERS of the PRESENT TIME. EDITED BY R. H. HORNE, ESQ.
LONDON: SMITH, ELDER, AND CO., 65, CORNHILL.

KNIGHT'S WEEKLY VOLUME.
This day,

THE TEXTILE MANUFACTURES OF GREAT BRITAIN. By G. DODD, Author of "Days in the Factories." London: CHARLES KNIGHT & Co., 22, Ludgate-street.

Neatly bound in cloth, price 1s. 6d.,

THE SCIENTIFIC PHENOMENA OF DOMESTIC LIFE, as they are presented in the House or in a walk in the Fields. Familiarly explained by CHARLES FOOTE GOWER, Esq., and arranged under the following heads:—The Bedroom; The Breakfast Parlour; The Morning Walk; The Kitchen; The Study; The Summer's Evening, &c. &c.
JAMES RIDGWAY, Piccadilly, and all Booksellers.

On Wednesday, July 24, was Published, price 5s., the First Part of the Fifth Volume of

THE JOURNAL OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Containing:—Mr. Baker: Prize Report on the Farming of Essex—Col. Le Couteur: On the Jersey (misnamed Alderney) Cow—Governor Moody: On the Tussac Grass of the Falkland Islands—Mr. Cowie: Prize Essay on Horse and Ox Teams—Mr. Palin: Prize Report on the Farming of Cheshire—The Earl of Lovelace: On the Growth of Beans and Cabbages—Mr. Randell: On Burnt Clay to cold and heavy Soils—Mr. Parkes: On the Influence of Water on the Temperature of Soils; and on the quantity of Rain-water, and its discharge by Drains—Mr. Tremayne: On the Preparation of the Wheat Crop in Cornwall—Mr. Little: Prize Report on the Farming of Wiltshire—Mr. Curtis: On the Natural History and Economy of Wireworms—Mr. Grey: On Cottages for Farm Labourers—Mr. Karkeek: Prize Essay on the Production of Fat and Muscle—Mr. Hannam: Experiments with Manures—Mr. Horsley: On Agricultural Labourers in the Lincolnshire Wolds—Mr. Fisher: On the Scour in Lambs—Sir Charles Burrell: On White Carrots—General Grey: Agricultural Notice from South Australia—Sir William Heathcote: Experiments with Manures—Mr. Rodwell: On the Italian Rye-Grass—Dr. Ure: Analyses of Guano—Earl of Essex: On Salt and Charcoal as food for Plants. With communications on the mode of procuring water for irrigation in Affghanistan, and on Mr. Chesterman's newly-invented Steam Apparatus; and Appendix, containing Reports of the Council, Prize-sheets for 1843, new Bye Laws of the Society, &c. &c.
JOHN MURRAY, Albemarle-street, London.

Just published, the Thirteenth Edition, price 2s. 6d.; free by post, 3s. 6d.,

THE SILENT FRIEND on NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row, Noble, 109, Chancery lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 146, Leadenhall st.; Purkiss, Compton-st., Soho, Wilson, 339, Oxford-st. (two doors from Argyll st.), London. The Cordial Balm of Syracum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11s. and 22s. PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2s. 9d., 4s. 6d., and 11s., by all Medicine Venders.

Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

This day is published, complete in one large volume 8vo, price 24s.,

LECTURES ON AGRICULTURAL CHEMISTRY and GEOLOGY. By JAMES F. W. JOHNSTON, M.A., F.R.S.S.L. & E., &c. &c.: Chemist to the Agricultural Chemistry Association of Scotland, and Reader in Chemistry and Mineralogy in the University of Durham. With an APPENDIX, containing Suggestions for Experiments in Practical Agriculture.—WILLIAM BLACKWOOD and SONS, 45, George-street, Edinburgh; and 22, Pall-Mall, London.

IMPORTANT AGRICULTURAL WORKS, published by JAMES RIDGWAY, Piccadilly; and to be had of all Country Booksellers in every Market Town.

1. PERUVIAN AND BOLIVIAN GUANO, with Practical Instructions for its use, and testimonials of its results, price 1s.

2. A Fourth Edition, enlarged, of MORTON on SOILS and the RENT and PROFITS of AGRICULTURE. Price 10s.

3. On MANURES, by CUTHBERT W. JOHNSON, Esq., F.R.S.; a New Edition greatly enlarged. Price 16s., bound in cloth.

4. SINCLAIR on GRASSES and the WEEDS of AGRICULTURE. A New Edition, with numerous coloured Plates. 30s. cloth.

5. JOHNSON'S TRACTS for AGRICULTURAL SCHOOLS. Price 1s. each:—
THE COTTAGE-FARMER'S ASSISTANT—CALENDAR for YOUNG FARMERS—and AGRICULTURAL CHEMISTRY for YOUNG FARMERS.

In the Press, VON THAER'S PRINCIPLES of AGRICULTURE. Translated by W. SHAW, Esq., in 2 vols. Price 25s. cloth.

HOOD'S MAGAZINE for AUGUST contains Editorial Cuts on topics of the day (in the "Comic Annual" style), and two Chapters of Hood's New Novel "Our Family;" also Contributions of varied interest, by G. P. R. James, R. Monckton Miles, M.P., F. O. Ward, R. Browning, Andrew Winter, the Author of "Ireland and its Rulers," Dr. Skelton Mackenzie, LL.D., Giddeon Shaddoe, the Mountaineer, Miss Lawrence, &c. An article on the "Leader of the Opposition," by the Author of "The Premier," in the last Number, will be given, and a Paper on the Polka is especially commended to the study of the Young Ladies. Sir Edward Bulwer Lytton, Bart., will write in the next Number.—HENRY RENSHAW, 356, Strand, and all Booksellers.

RENDLE'S TANK SYSTEM OF HEATING.

IN consequence of the increasing demand for RENDLE'S "TREATISE ON THE TANK SYSTEM," a THIRD EDITION has just been published, and can now be obtained of all Booksellers, or of the Author, at Plymouth.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

Price Sixpence, Free by Post Sevenpence,

The Lancet,

Of Saturday last, July 20, contains
A COURSE of LECTURES on ORGANIC CHEMISTRY, Delivered in the University of Giessen, by PROFESSOR LIEBIG:—
The Theory of Acids.
On the Errors and Mischiefs of the Sound and Catheter, and on the Nature and Treatment of Urinary Stricture, by T. Wilkinson King, Esq.
The Periods Regulating the Recurrence of Vital Phenomena, by Dr. T. Laycock.
Congenital Fissure of the Iris, by Dr. C. T. Mackin.
Case of Ovarian Dropsy, in which Tapping was performed Seventy-eight times, by J. C. Atkinson, Esq.
Practical Observations and Suggestions, by Dr. Marshall Hall.—On Inducing Warm and Moist Atmosphere in the Sick Room, &c.
Practical Facts and Observations on Diseases of Women, and some Subjects connected with Midwifery, by G. O. Heming, M.D.—On Uterine Polypus.
Case of Phlebitis terminating Fatally in Twenty-four Hours, by J. Berncastle, Croydon.
Answer to the Remarks of a Writer in the Medical Gazette, on the Functions of the Spinal Marrow, by M. B.
BRITISH AND AMERICAN MEDICAL JOURNALS:—
The Soft Occiput; its Nature and Symptoms. The Infirmary for Diseases of the Rectum. Inhalation of Oxygen Gas as an Antidote to Poisoning with Carbonic Acid. Tartar-emetic a Remedy for Syphilis. Death from Rupture of the Lung. Influence of a Varying State of the Price of Provisions on Disease and Mortality. The Microscopical Characters of Milk. American Medical Students. The Sedative Powers of the Ergot of Rye. The Nature of the White or Opake Serum of Blood. The Symptoms of the Second Stage of Cancer in the Stomach. The Employment of Electro-Puncture in Neuralgia.
CHEMISTRY, PHARMACY, AND MATERIA MEDICA:—
Dumas' Chemico-Physiological Theories.—Theory of Respiration. Inorganic Constituents of Vegetables. Presence of Fluorine in Bones. Mineral Marmoratum, or Paste, to fill Hollow Teeth. Tooth Powders. Test for Arsenic.
Pauper Lunatics in Workhouses.—Clinical Instruction in Hospitals.
HOSPITAL REPORTS:—
UNIVERSITY COLLEGE HOSPITAL.—Strangulated Femoral Hernia of Two Days; Operation: Death. Strangulated Femoral Hernia of several days; Operation: Cure. Strangulated Inguinal Hernia; Operation; Abscess of Sac; Cure
LONDON HOSPITAL.—Dense Cyst filled with Fluid occupying the Position of a Psoas Abscess.
CHELTENHAM GENERAL HOSPITAL.—Fracture of the Skull attended with External Pulsation.
Statement of the Society of Apothecaries.
The late Inquest at Lambeth again.
Examinations at the University of London.
Remarks on Lecturers and Hospital Practice.
Clinical Lecturing in Hospital Practice.
On the Value of Sulphate of Iron as an antidote in Poisoning by Prussic Acid.
MEDICAL SOCIETIES:—
ROYAL MEDICO-BOTANICAL SOCIETY.—On Atropa Belladonna.
News of the Week—Apothecaries' Hall—Mortality Table—Correspondents.
London: J. CHURCHILL, Princes-street; and all Booksellers and Newsvenders.

SCHOOL AND COLLEGE BOOKS,
Printed for LONGMAN, BROWN, GREEN, AND LONGMANS.

1.
ENGLISH; or, the Art of Composition explained in a Series of Instructions and Examples. By G. F. GRAHAM. 2d Edition, fcp. 8vo. 7s.

2.
HELPS to ENGLISH GRAMMAR; or, Easy Exercises for Young Children. By G. F. GRAHAM, Author of "English; or, the Art of Composition." 12mo. with Wood Engravings, 3s.

3.
FIRST STEPS to LATIN WRITING: intended as a Practical Illustration of the Latin Accidence. To which are added, Examples on the principal Rules of Syntax. By G. F. GRAHAM. 2d Edition, improved, 12mo. 4s.

4.
A PROGRESSIVE GRAMMAR of the LATIN LANGUAGE, for the Use of all Classes in Schools. By the Rev. B. H. KENNEDY, D.D., Head Master of Shrewsbury School. 12mo. 4s. 6d.

5.
LATIN GRAMMAR PRACTICE. 1. Lessons in Vocabulary; 2. Latin, made out of each column for translation; 3. English for retranslation. By the Rev. JAMES PYCROFT, B.A. 12mo. 2s. 6d.

6.
GREEK GRAMMAR PRACTICE. 1. Lessons in Vocabulary; 2. Greek, made out of each column for Translation; 3. English for retranslation. By the Rev. JAMES PYCROFT, B.A. 12mo. 3s. 6d.

7.
AN ELEMENTARY GRAMMAR of the GREEK LANGUAGE. By Dr. RAPHAEL KUHNER, Co-Rector of the Lyceum, at Hanover. Translated by J. H. MILLARD, St. John's College, Cambridge. 8vo. 9s.

8.
MAUNDER'S UNIVERSAL CLASS-BOOK: a New Series of Reading Lessons (original and selected) for Every Day in the Year; with Questions for Examination. By SAMUEL MAUNDER, Author of "The Treasury of Knowledge," &c. 2d Edition, 12mo. 5s.

9.
AN ELEMENTARY TREATISE on ALGEBRA, Theoretical and Practical. By JAMES THOMSON, LL.D., Professor of Mathematics in the University of Glasgow. 12mo. 5s.

10.
ELEMENTS of NATURAL HISTORY, for the use of Schools and Young Persons. By Mrs. LEE (formerly Mrs. T. E. BOWDICH), Author of "Taxidermy," &c. 12mo. with 55 Woodcuts, 7s. 6d.

11.
HAMEL'S FRENCH GRAMMAR and EXERCISES. A New Edition, in One Volume, improved and enlarged. By N. LAMBERT, 12mo. 5s. 6d.—KEY, 4s.
London:—LONGMAN, BROWN, GREEN, AND LONGMANS.

WORKS PRINTED FOR

TAYLOR AND WALTON,

28, UPPER GOWER STREET.

LIEBIG'S AGRICULTURAL CHEMISTRY.

Third Edition, Revised and partly re-written. 8vo. 10s. 6d., cloth,

CHEMISTRY in its APPLICATIONS to AGRICULTURE and PHYSIOLOGY. By JUSTUS LIEBIG, M.D., F.R.S., Professor of Chemistry in the University of Giessen. Edited, from the Manuscript of the Author, by LYON PLAYFAIR, PH. D.

"—a book infinitely superior to its predecessors, and to a very considerable extent unlike them."—*Gardeners' Chronicle.*

LIEBIG'S ANIMAL CHEMISTRY.

Second Edition. 8vo. 9s. 6d. cloth.

ANIMAL CHEMISTRY; or, CHEMISTRY in its APPLICATIONS to PHYSIOLOGY and PATHOLOGY. By JUSTUS LIEBIG, M.D. Edited, from the Author's Manuscript, by WILLIAM GREGORY, M.D., Professor of Chemistry in the University of Edinburgh.

"While we have given but a very imperfect sketch of this original and profound work, we have endeavoured to convey to the reader some notion of the rich store of interesting matter which it contains. The chemist, the physiologist, the medical man, and the agriculturist will all find in this volume many new ideas and many useful practical remarks. It is the first specimen of what modern Organic Chemistry is capable of doing for Physiology; and we have no doubt that from its appearance Physiology will date a new era in her advance."—*Quarterly Review*, No. 139.

LIEBIG'S CHEMICAL LETTERS.

Second Edition, Fcap. 8vo, 4s. 6d. cloth,

FAMILIAR LETTERS ON CHEMISTRY; AND ITS RELATIONS TO COMMERCE, MANUFACTURES, AND AGRICULTURE. By JUSTUS LIEBIG, M.D. Edited by JOHN GARDNER, M.D., Member of the Chemical Society.

"That the public will discover its merits, and that it will find its way into the drawing-room as well as the library, and be equally prized by the advanced man of science and the student, we venture to say is certain; and it must increase the respect entertained for Chemistry wherever it is read."—*Chemical Gazette.*

CHEMICAL ANALYSIS.

One Volume 8vo, with numerous Diagrams, 10s. 6d. cloth.

ELEMENTS OF CHEMICAL ANALYSIS, INORGANIC AND ORGANIC. By EDWARD ANDREW PARNELL, late Chemical Assistant in University College, London.

"In conclusion, we cordially recommend this work to those who are disposed to aid themselves in examining the constituents of their soils. Mr. Parnell deserves the best thanks of English chemists for his masterly work, and we earnestly hope that it will prove the means of elevating the analytical chemistry of our country—a branch of the science in which we have long been deficient."—*Farmers' Magazine*, Nov. 1842.

TURNER'S CHEMISTRY:

By Professors LIEBIG and GREGORY. Complete in 1 vol. 8vo, 1l. 8s. cloth.

TURNER'S ELEMENTS of CHEMISTRY. Seventh Edition. Edited by JUSTUS LIEBIG, M.D., F.R.S., Professor of Chemistry in the University of Giessen; and WILLIAM GREGORY, M.D., Professor of Chemistry in the University of Edinburgh.

"As a compendium of the present state of Chemistry, and a text-book for all beginners, we consider it as unequalled by any in the English language, and we even doubt whether there are any of the foreign manuals of an equal size which can venture to compete with it."—*Chemical Gazette*, Dec. 1, 1842.

LINDLEY'S ELEMENTS OF BOTANY.

One vol. 8vo, with many hundred figures on wood, 10s. 6d. cloth.

LINDLEY'S ELEMENTS OF BOTANY, STRUCTURAL, PHYSIOLOGICAL, SYSTEMATICAL, and MEDICAL; being a Fourth Edition of the Outline of the First Principles of Botany.

"This Work is indeed what the author intended it to be, 'A Complete Botanical Note-book, wherein all the principal topics which the teachers of Botany introduce into their lectures, are arranged methodically.' The necessity for such works as pegs for fixing facts in the memory, and giving them their full value on their application to reasoning processes, is undeniable; and between the skill of the author and that of the engraver, it is scarcely possible to present elementary notices on a simpler and more available plan. One consequence of this is, the impossibility of further analysis. Our readers must, therefore, rest contented with a reference to the work itself."—*Athenæum*, May 28th, 1842.

STEAM ENGINE, STEAM NAVIGATION, AND RAILWAYS.

Seventh Edition, with very numerous Illustrations, 8vo, 12s. cloth,

THE STEAM-ENGINE EXPLAINED and ILLUSTRATED; with an account of its Invention and progressive Improvement, and its application to Navigation and Railways: including also a Memoir of Watt. By Dr. LARDNER.

GUIDE TO THE STARS.

In 8vo, with 12 Maps, price 6s. 6d. cloth,

TWELVE PLANISPHERES, forming a Guide to the Stars for every Night in the Year; with an Introduction.

COMPLETION OF MULLER'S PHYSIOLOGY.

In two volumes 8vo, each volume 20s.,

ELEMENTS OF PHYSIOLOGY. By J. MULLER, M.D., Translated from the German, with Notes, by WILLIAM BALY, M.D. With Steel Plates and very numerous Wood Engravings.

"We *do*, however, recommend it very strongly, and we have no hesitation in saying that it will supersede all other works as a Text Book for Lectures, and one of reference for students. It steers a middle course between the superficial brevity of many of our modern works, and the pleonastic and metaphysical jargon of Burdach."—*Med. Chir. Review*, April 1838.

Printed by WILLIAM BRADBURY, of Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 27, 1844.

The Newspaper.

SATURDAY, JULY 27, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—
Trustees.

Sir Jas. Duke, Ald., M P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

NORTH BRITISH INSURANCE COMPANY, Established 1809. His Grace the Duke of Sutherland, KG., President; Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman; John Webster, M.D., F.R.S., 24, Brook-street, Physician. THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. BOYD, 4, New Bank Buildings, or of the Actuary, 10, Pall-Mall East. JOHN KING, Actuary.

Price Sixpence, free by post.

The Railway Chronicle

The Second Edition, published 12 o'clock on SATURDAY last, JULY 20, contained

THE AMENDED RAILWAY BILL — ONE WORD MORE ABOUT THIRD CLASS FARES—THE SPEECHES OF MINISTERS AND THEIR BILL—FURTHER CHANGES IN STANDING ORDERS — BOARD OF TRADE INTERFERENCE—HOLYHEAD RAILWAY and HARBOUR, and MR. PAGE'S REPORT—SIR JOHN MACNEIL'S REPORT on the DUBLIN and CASHEL RAILWAY.

REPORTS of RAILWAY MEETINGS—The United Midlands, Swinton, Lincoln, and Doncaster Extension—The Extension of the Ulster Railway to Armagh—Public Meeting in Glasgow—Meetings at Banbury, Lincoln, Keghley, Inverness, Sherbourne.

FRENCH CHAMBERS, PROCEEDINGS IN PARLIAMENTARY and LEGAL PROCEEDINGS.

VALUE OF SHARES—Returns from London, Liverpool, Manchester, Leeds, York, Hull, Glasgow, and Paris, with comments on the respective Markets.

FOREIGN CORRESPONDENCE.—Hanover.

REPORT of the last Meeting of the Institution of Civil Engineers.

RAILWAY LITERATURE.—The Quarterly Review on Railway Legislation.

MECHANICAL IMPROVEMENTS—Expansive Gear, the Link Motion (*with Engravings*)—Margary's Method of Preserving Wood—Nasmyth on the Principle of Railways (*with three Engravings*).

MISCELLANEA—Accident at Glasgow—Pleasure Trips—Last Mail, &c.

CONTRACTS, CALLS, PATENTS, IRON TRADE, TRAFFIC TABLES, &c. &c.

Order The Railway Chronicle of any Newsvender.

CONTENTS of the NUMBER for SATURDAY last, JULY 20, OF

THE ATHENÆUM,

JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND THE FINE ARTS.

Twenty-four Large Quarto Pages, PRICE FOURPENCE,

Or Stamped, to go free by post, 5d.

REVIEWS OF, WITH EXTRACTS FROM—

High Life in New York, by Jonathan Slick
Martin Chuzzlewit, by Charles Dickens, Esq.
Correspondence of Right Hon. Edmund Burke; edited by the Earl Fitzwilliam
The Life of Lord Chancellor Eldon, by Horace Twiss, Esq.
Historical Handbook for the Poetical Literature of the Germans, by G. G. Gervericus. [Handbuch, &c.]

WITH SHORTER NOTICES OF THE FOLLOWING:—

Constancy and Contrition
The Anglican Church, the Creature and Slave of the State
Polynesia: a Sketch in Verse, by J. P. Gibbins
Colloquies, by C. L. Lordan
Short Treatise on Life Assurance, by F. Lawrance
Guide to Life Assurance, by A. Young
The Works of Rabelais
Seven Blessings for Little Children, by Mrs. Gilbert
The Two Destinies, by Sir F. H. Doyle
Flowers of Many Hues
The Elementary Properties of the Ellipse, by the Duke of Somerset
Greek Grammar Practice, by the Rev. J. Pycroft
Pulmonary Consumption, by Dr. Hastings

ORIGINAL PAPERS.—Rule for Converting Degrees of the Centigrade Thermometer into those of Fahrenheit, and *vice versâ*, by Professor Stevelly.
" " On the Book of the Gospels used at the Coronation of the Anglo-Saxon Kings, by J. O. Westwood, Esq.
" " Characters in "As You Like It"—Rosalind and Orlando.

MISCELLANEA.—Paris Academy of Sciences—Lunar and Atmospherico-aquatico Volcanoes—City Improvements—Brass Effigies—The Collection at Autun.

Order The Athenæum of any Bookseller or Newsman.

LUXURIES FOR WET OR WARM WEATHER, REALLY WATERPROOF.

BERDOE'S SUPERIOR LIGHT SUMMER FROCKS, SHOOTING JACKETS, COATS for the SEASIDE, COUNTRY, &c.—An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance or wish to avoid disappointment and vexation.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

News of the Week.

THE proceedings of both Houses of Parliament present few topics which call for notice. The business transacted is now of that routine character which always marks the close of the Session; and many measures which would have excited general interest at an earlier period are now hurried through with all possible dispatch, or postponed altogether for further consideration in the recess. It is stated by the Ministerial papers that the regular business of Parliament will probably be disposed of by the end of the first week in August, that Parliament, however, will not then be prorogued, but the Session be continued by adjournment to the 24th of August. The object of this arrangement is said to be to afford time for receiving the report of the Judges and making up the judgment of the House of Lords on the Writ of Error brought in by Mr. O'Connell and his fellow-prisoners. In the Lords, the Bill for legalising Art Unions has been read a third time without opposition or amendment. Various other measures have passed, including the Bill for preventing the further progress of the celebrated *Qui Tam* Actions, the County Coroner's Bill, and a Bill for amending the Insolvent Debtor's Act, drawn up by a select committee which has engrafted the principle of Lord Cottenham's Bill for the relief of Insolvents, on a Bill somewhat similar in its objects introduced by Lord Brougham. In the Commons, on Friday, Mr. Gibson's motion for a special commission to inquire into the cause of incendiarism in the Eastern Counties, was opposed by Government, and negatived on a division by 130 to 41. On the same night Sir R. Peel made the important announcement that Government are resolved to adopt speedy and decisive measures for extending education in Ireland, not only by increasing the elementary schools, but by enlarging the existing means of academical instruction. The Premier declined to give any further indication of the intentions of Government, but from his admission that the College of Maynooth is not adequately supported, it is believed that the grant to that establishment next year will be materially increased. On Monday, the Railways Bill passed through committee, after an announcement by Mr. Gladstone that Government had assented to certain modifications, in order to meet the objections of the Railway Companies. Mr. Sheil's motion for the production of papers relative to the French colony of Algeria led to a long discussion on the policy pursued by this country in regard to the French settlements in Africa, from the first diplomatic remonstrance made by Lord Aberdeen in 1830. Both parties, however, seemed disposed to feel that the French settlements had too long received a tacit acquiescence to render the production of papers advisable; and after an incidental debate on the state of the navy, the motion was negatived without a division. The Poor Law Bill has also been one of the chief topics of discussion. Various amendments have been proposed, the objects and results of which are fully given in our Parliamentary Report; and after numerous divisions, the Bill passed through committee on Thursday, to be read a third time last night.

In France the Parliamentary Session is also drawing to a close, and both Chambers will probably be prorogued in the course of the next week. The accounts from Algiers are not very precise or satisfactory, but there seems to be no doubt that Marshal Bugeaud has found it necessary to resort once more to decisive measures. The last advices state that the Emperor is anxious for a pacific arrangement with France, but his troops appear to be entirely beyond control, and are continually harassing the Marshal with fresh aggressions. Rumours have been current in Paris that the Prince de Joinville has found it necessary to bombard Tangiers, but no official confirmation of the report has been received, although the papers generally admit that there is little hope of terminating the differences with Morocco otherwise than by force of arms.—From Spain we have accounts of further executions without trials, and attended by many of those circumstances of cruelty which have already excited the indignation of all civilised nations against Spanish Governments. The whole country seems to be in a state of disorganisation, and the expedition against Morocco is supposed to be promoted by the Ministry as a means of diverting the public excitement from their own acts of aggression.—The Papal provinces of Italy are also in a state of dangerous ferment, another execution for political offences connected with the insurrection of last year having taken place at Bologna. The recent revolt in Calabria is said to have failed solely from the want of promised supplies, and although the different Governments announce that tranquillity is retored, the secret discontent of the people is the source of much anxiety and apprehension.

Home News.

COURT.—The Queen and Prince Albert, the Prince of Wales, and the Princesses continue at Windsor Castle, and are quite well. On Sunday, Her Majesty and Prince Albert attended Divine Service in the private chapel. In the forenoon, the Queen and Prince, accompanied by the Princess Royal, walked in the pleasure-grounds of the Castle. Her Majesty and his Royal Highness took a drive in the afternoon in a pony phaeton. The Prince of Wales and the Princess Alice were also taken their accustomed airings. On Monday morning her Majesty and Prince Albert took an airing in a pony phaeton, and visited the Duchess of Kent at Frogmore-lodge. In the afternoon, the Queen and Prince also drove out in a pony phaeton. On Tuesday morning the Queen and Prince Albert, accompanied by the Princess Royal, walked in the pleasure-grounds of the Castle. Her Majesty and the Prince also rode out in a pony phaeton. The Prince of Wales and the Princess Alice, accompanied by the Dowager Lady Lyttleton, were taken an airing in the forenoon, in an open carriage. In the afternoon Her Majesty and the Prince took an airing in a pony phaeton, the Prince driving. On Wednesday morning the Queen and Prince Albert, accompanied by the Prince of Wales, walked in the pleasure grounds of the Castle, and also took an airing in a pony phaeton, visiting the Duchess of Kent at Frogmore Lodge. The Princess Royal and Princess Alice, accompanied by the Dowager Lady Lyttleton, were taken their usual walks and rides. In the afternoon the Queen rode out in an open carriage, the Prince and the equerries following on horseback. On Thursday morning Her Majesty and the Prince took an airing in a pony phaeton, and again in the afternoon, the Prince driving.—The visitors to Her Majesty this week at Windsor have been the Duke and Duchess of Buccleugh, the Marquis and Marchioness of Douglas, Earl and Countess De Grey, the Countess Wratislaw, the Earls of Aberdeen and Westmoreland, Sir R. Peel, Sir H. Wheatley, and the Rt. Hon. H. Labouchere. Colonel Arbuthnot has succeeded Colonel Buckley as Equerry in Waiting on the Queen, for a few days.—The apartment selected for the accouchement of Her Majesty at Windsor Castle is in the Augusta Tower, situate between the Victoria Tower (in which are the rooms appropriated for the nursery of the Royal family) and the York Tower, and commands a beautiful prospect to the southward, extending over the Long Walk, Windsor Forest, and the Great Park, and bounded by the Surrey hills. Two engines, attached to special trains, are to be kept in constant readiness, with their steam up both day and night, at the Paddington terminus of the Great Western Railway, to start at five minutes' notice for the Slough station, to convey the great officers of state to Windsor Castle upon their being summoned from town on the occasion of the accouchement. A powerful alarum has been fixed at the Galvanic Telegraph-office at Paddington, communicating with the telegraph at Slough, for the purpose of arousing the attendant who sleeps at the office, in the event of a telegraphic express reaching the terminus from Windsor during the night. A trusty person has also been appointed to remain in attendance at the office of the Slough station throughout the night. It is computed that a message can be expressed by the aid of the telegraph from Windsor Castle to Buckingham Palace in 25 minutes.

THE QUEEN DOWAGER, accompanied by Prince Edward of Saxe Weimar, arrived on Thursday morning at Marlborough House from the Continent. Her Majesty landed at Woolwich, and is in excellent health.

THE KING OF SAXONY.—His Majesty arrived at Bowness on Thursday evening, accompanied by the Saxon Minister and his suite. The evening being very fine, his Majesty took a boat on the lake to enjoy the beauties of Windermere, and returned to the Royal Hotel to dinner. On Friday his Majesty was early astir, walking over the adjacent heights to see the many beautiful views of the lake and surrounding country, and left at 9 A.M. for Ambleside. A number of the respectable inhabitants and visitors were there assembled to witness the arrival of his Majesty, who returned the greetings of the company in a friendly manner. On alighting from his carriage, his Majesty, accompanied by a part of his suite, took the road to Keswick, leaving the carriages to follow, wishing to avoid any display, and to dispense with any token of enthusiasm which those assembled might wish to offer. His Majesty arrived at Carlisle on Friday evening. Immediately on his arrival the King, accompanied by the Mayor, visited the castle, cathedral, &c., and after remaining all night at the Bush Hotel, left at 12 o'clock on Saturday for Hamilton Palace, the seat of the Duke of Hamilton, where his Majesty arrived on Sunday morning. On Monday evening, his Majesty unexpectedly visited Glasgow. After spending a few minutes at the Buck's Head Hotel, his Majesty drove off to the College, and spent a brief space in the museum, his visit not occupying more than ten minutes altogether. Subsequently he went to the Exchange, but in such a quiet and unostentatious manner, that the circumstance was not known even to the few gentlemen who were present in the room till a

considerable time after his departure. His Majesty was attended by his suite, Mr. M'Donald, of the hotel, acting as the cicerone of the party. Mr. Brown, chamberlain to the Duke of Hamilton, accompanied his Majesty from Hamilton. Before 8 o'clock, his Majesty was on his way to Balloch, where he was to spend the night. On Tuesday morning the King proceeded up Lochlomond, and thence, it is understood, to the North of Scotland.

PRINCE FREDERIC OF PRUSSIA.—It is understood that H.R H. Prince Frederic William Louis of Prussia, brother of the King, and heir-apparent to the Prussian throne, is expected on a visit to Her Majesty in the early part of next week. On account of Her Majesty's expected accouchement His Royal Highness will take up his residence at the mansion of Chevalier Bunsen, the Prussian Minister, who returned on Monday last from Berlin, for the especial purpose of receiving the Prince in Carlton-terrace. His Royal Highness will probably be present at the Goodwood races.

THE KING OF THE FRENCH.—It is well known that King Louis-Philippe has promised to pay Her Majesty a visit this autumn. The Ministerial papers now state that His Majesty will embark at Treport, in September, for this country. His Majesty will be accompanied by two ships of 74 guns, and four or five steamers, and will land at Portsmouth, whence he will proceed by railway to the station nearest to Windsor. His Majesty will remain eight days at Windsor, and will not visit London.

Pensions on the Civil List.—The following pensions have been granted during the year ending June 20th last:—Lady Bell, 100*l.* a year, in consideration of the services rendered to science by her late husband, Sir Charles Bell; Miss Ann Drummond, in consideration of the public services of her brother, the lamented Edward Drummond, Esq., assassinated by Macnaghten, 200*l.* a year; Robert Brown, Esq., the botanist, 200*l.* a year; Lady Sale, wife of the hero of Jellalabad, 500*l.* a year; and Sir W. Rowan Hamilton, the Astronomer Royal for Ireland, 200*l.* a year—making, altogether, 1200*l.* per annum.

Foreign.

FRANCE.—The Chamber of Deputies terminated on Thursday the discussion on the budget of expenditure, which was voted by 201 against 59. They afterwards adopted, without any opposition, the Bill authorising M. Arnoux to execute at his own expense the Paris and Sceaux railroad; and another granting a sum of 1,800,000f. for an experiment of the atmospheric system on the portion of the Chartres line which is to cross the plain of Sartorz. The Chamber had previously adopted the amendment of M. Salvandy and others, who had proposed that the University tax, which produces annually about 1,600,000f., should cease to be levied after the 1st of January, 1845. Another amendment, equally important, moved by M. Garnier Pagès, was also carried, allowing the Minister of Finance to negotiate the loan for 300,000,000 of francs by way of subscription, as in Belgium. The Chamber of Peers adopted on Saturday without amendment, the Bill for authorising the construction of a railroad from Paris to the Belgian frontier, and to the British Channel; and the Railroad Bill from Paris to Rennes. The Session is now fast drawing to a close, and so far as the Deputies are concerned it may be considered as already at an end. By the time the Peers have disposed of the Bills before them, the Session will probably have lasted seven months. The *Débats* pronounces it a most laborious one, and perhaps, the most fruitful Session since 1830, owing to the number and importance of the Bills that have been passed. The same Ministerial print reckons at 30 the smallest majority the Cabinet have had on any great political question.—A telegraphic despatch from Bayonne of the 18th, states that H.R.H. the Prince de Joinville arrived in the roads of Gibraltar on the evening of the 8th in the Pluton steamer. His Royal Highness proceeded to Tangiers on the 9th, and in the evening, on his return, paid a visit to the Governor-General. He was received with the utmost distinction by the authorities of Gibraltar, and by the inhabitants, who crowded around him. A telegraphic despatch of the 10th from Tangiers announces that "A letter from the Pacha of Larache declares, in the name of the Emperor, that the Prince disavows formally the aggression of the 15th June, and that he has ordered his son to expel the guilty from the ranks of the army, by dismissing the principal chiefs." Accounts of a different nature, however, have been received from Algiers to the 16th by the Ville de Bordeaux steamer, which arrived at Marseilles on the 18th. At the time when she left Algiers it was not known that the Prince de Joinville, with his fleet, had left Oran for Tangiers. It was said in Algiers that Marshal Bugeaud intended to follow up his attacks upon the Moors by more decisive measures; and a subsequent despatch from the Marshal's camp states, that, having been provoked by fresh aggressions, he had already routed and pursued the Moors for some distance beyond Ouchda. It was also reported in Algiers, in opposition to the general opinion as to the Emperor of Morocco's pacific dispositions towards France, that after the affair of the 15th the Moors were supplied with reinforcements from Fez, and it was expected that an appeal to arms would soon take place.—The *Revue de Paris* confirms the statement of our own ministerial papers, that the visit of Louis-Philippe to England is definitively fixed for the end of September. It adds that Queen Victoria will not receive his Majesty in the Isle of Wight, as it was originally intended, but at Windsor Castle.—Some of the Paris papers state that the Ministry are preparing to make a new batch of peers. None of the members of the present Chamber of Deputies will be among the number, but the names of several who were formerly deputies, and some general officers, are mentioned as likely to be promoted. Among the names mentioned is that of M. Victor Hugo, but his advancement to the peerage seems doubtful.—The old Irish in France are gradually dying off: a letter from Paris announces the death on Wednesday last, of Colonel Charles O'Neill, of the late 27th Regiment of the Line, and which had, before the Revolution of 1789, been known as Walshe's Regiment, or the Irish Brigade. The same letter refers to the demise of Colonel Terence O'Reilly, at Evreux, Normandy, and contains interesting memoirs of both officers.—The Post-office of France received in 1843, 114,200,000 letters, 3 200,000 of which could not be delivered, or were refused. The 111,000,000 remaining produced 41,569,200f. The post-office, moreover, distributed 60,000,000 printed sheets, which produced 2,400,000f.—in all, 43,969,200f.

SPAIN.—Accounts from Madrid, of the 18th, state that a most painful feeling has been created throughout the empire by the recent barbarous executions at Saragossa. The Government seems determined to create excitement as an excuse for its acts of aggression. It appears that, without a shadow of reason, the Captain-General of Aragon had proclaimed that province in a state of siege, and commenced operations by dragging Don F. Lagunas, the former commander of the National Guards of Saragossa, and two other citizens, before a military tribunal, under pretence of their having been parties to the death of General Esteller more than six years ago. These unfortunate men were condemned, and immediately shot. Other executions no less atrocious had taken place at Caspe. In June three Carlists and two smugglers were arrested in that town, on their return from France, and their trial before the territorial tribunal was fixed for the 12th inst. On the 30th ult. they were informed that the Minister of War had ordered them to be shot, and they hastened to address a petition to the tribunal, in which they claimed the protection of the judges, and placed themselves under the safeguard of the laws. A letter from Caspe, of the 9th, thus describes their fate:—"Yesterday morning," it says, "a detachment of 20 infantry and 9 cavalry arrived here from Alcaniz. The three unhappy Carlists were removed from their dungeons and enjoined to confess, and at 12 o'clock they were shot. The judge opposed, by every legal means, so flagrant an injustice, but what can the tribunals do in presence of bayonets? One of the three sufferers, Pajares, died without confession, and Christian burial was denied to his remains." The *Heraldo*, of the 13th, states that the province of Almeria is declared in a state of siege, and the only reason given is, that a few of the lower classes had been heard to utter seditious cries. The Government papers are filled with accounts of pretended conspiracies and depôts of arms.—M. Viluma was to resume the post of Ambassador in London, and Count de Colombi had been appointed Chargé d'Affaires in Brussels.—A letter from Gibraltar of the 5th mentions that the steamer Vesuvius, which sailed on the 26th ult. from Mogador with Mr. Hay, Consul-General of England at Tangiers, had returned to Gibraltar. The Consul was to proceed from Mogador to the residence of the Emperor, and there was reason to hope that his mission would be successful, although the Spanish Government had declared their intention to attack and occupy Tangiers with a force of 10,000 men. The Dutch squadron, commanded by Prince Henry of Holland, reached Gibraltar on the 6th, in fourteen days from Plymouth.—Letters from Barcelona of the 14th inst. announce the arrival in that harbour on the 13th of H.M.S. ship Formidable, 84, bearing the flag of Admiral Sir E. Owen, and the brig Aigle, 24, from Malta. Both vessels on arriving, fired the usual salute, which however was not returned from the shore, and the Admiral having applied to the Captain-General for an explanation of this slight, was informed that, according to the naval *ordenanzas* of Spain, where the Sovereign was residing no salute could be returned to the representatives of any nation. The Formidable again set sail on the 16th for Gibraltar.

PORTUGAL.—We have advices from Lisbon of the 17th. The Government had been compelled to enter into arrangements with its creditors, being unable to meet its engagements on the 15th inst., and those it had to meet for the next three months. It had therefore called together its creditors, and demanded a renewal of the bills falling due at the periods referred to. Considerable difficulties arose and were surmounted, and the bills were finally renewed to the amount of 600 contos! Our countryman, Mr. Tozer, is still in strict imprisonment; 95 days have elapsed since he was placed in custody at Coimbra; and though sent to Lisbon for trial, he has not yet been placed under the jurisdiction of the British Conservatorial Court.

GERMANY.—Letters from Coblentz of the 12th state that the King and Queen of Prussia are expected to visit that city for some time during the autumn, and that they will reside in the Castle of Stolzenfels. Preparations are making for their reception in the palace and gardens. The Queen will previously go to Ischl, for the benefit of the waters, and then to Munich, where the King will join her and accompany her to the Rhine.—A Frankfort journal publishes an account of the population of Prussia, from which it appears that, in Prussia Proper, and all the States under the Prussian Crown, the number of inhabitants in 1840 was 14,934,340. This number, however, must have increased considerably since 1840, for, after England and Ireland, Prussia is, it is said, the state of Europe in which the population increases most rapidly.—A letter from Trieste says that the Emperor of Austria is expected in that city on the 26th of August; but that there is no truth in the report that the Pope is to be there to meet him. Serious riots had occurred in Prague in consequence of the Jewish manufacturers reducing the wages of their workmen 50 per cent. as a means of retaliating on the Government for lowering the duties on foreign cottons. The workmen on the railroad had also some cause for dissatisfaction against the contractor; and the two classes of labourers united, burnt the houses of the Jewish masters, and would have attacked the town, if the Governor had not called out the whole garrison. The mob became furious at the sight of the troops, and destroyed the chimney of the Guard-house, upon which the troops fired upon them; and out of nine persons wounded, two have died. A letter from Dresden states, that since the recent troubles at Prague, letters arriving at Dresden from Bohemia are almost all opened by the authorities, and resealed with the imperial arms.—The *Wurtzburgh Gazette* observes, that the late debates in the British Parliament relative to the violation of the secrecy of correspondence fully account for the accurate information obtained in England respecting the proceedings and resolutions of the Customs' Commissioners assembled at Stuttgard in 1842, and for the *Times* publishing the tariff of the Customs Union a month before it officially appeared in Germany.

BELGIUM.—A letter from Antwerp, dated the 16th inst., informs us that the dike of Lille has again given way. An inhabitant of Lille has sent a short notice of it to the Brussels papers; he says:—"This morning at 10 o'clock, the part of the new dike made after the accident of the 3d of last month gave way; this breach is exactly like the first, and at the same place. This event is extremely unfortunate, and has caused general consternation here. It is doubtful, after what has happened, whether the works for restoring the dike can be continued this year.

SWITZERLAND.—The great federal shooting meeting at Basle is concluded. It is calculated that the number of carabine-shots fired was at the least 250,000; and, it is said, on the Sunday, no fewer than 21,000 bottles of wine were drank in a few hours. The list of all the prizes would fill many columns. There were three grand prizes of the respective value of 3780fr., 2400fr., and 2100fr.—the first being won by Col. Hunerwald, of Lenburg, in Argau; the second by M. Benzinger, of Appenzel; and the third by Lord Vernon, who obtained his naturalisation in Switzerland, in order to have the right of competing. His Lordship is said to have made a vow that he will not leave Switzerland until he has won the first prize. His skill has excited so much jealousy in the country, that a citizen of Appenzel, named Kohler, one of the most renowned marksmen in Switzerland, had recourse to a most unworthy trick to gain the superiority over Lord Vernon. By giving a heavy bribe, he seduced a marker to put down to him many more hits than he actually made. The fraud, however, was discovered: M. Kohler was obliged to leave Basle immediately, and, by a council of the Federal Carabineers, he is disqualified from ever shooting again at any public match. The marker, who broke the oath he took to mark justly, has been arrested, and will be tried.

RUSSIA.—Letters from Elsinore and Copenhagen, of the 15th, state that a Russian fleet of 13 ships, including 8 line-of-battle ships, has suddenly made its appearance in the Sound. It is under the command of Vice-Admiral Count Platen. It is said that the fleet will proceed to the north, to meet the new ship of the line, the New Ingermanland, built at Archangel, instead of the Ingermanland which was wrecked last year. It is said to have the Grand Duke Michael on board: other accounts say the Grand Duke Constantine, who, as High Admiral, will take the command of the squadron, which will be joined by the Aurora frigate on her return from London.—Letters from Kissengen announce the approaching arrival in this country of that celebrated statesman and diplomatist, Count Nesselrode. His Excellency being recommended by his physician a course of sea-bathing after the course of saline waters, has fixed upon Dover or Brighton for the purpose; but it is considered probable that it will be the former place.

ITALY.—The *Augsburg Gazette* of the 10th contains a long communication, giving an account of the plans formed by the Italian conspirators; one part of which, that relative to Naples, has so recently failed in Calabria. The main point explained is, that a grand conspiracy exists, which had its agents at Vienna, Paris, and London, principally in the last, for uniting all the different States of Italy into one great government—whether Royal or Republican was left for future consideration. The Pope and the Church were to be dismantled, the King of Naples sent adrift, the several dukedoms to be dispensed with, the kingdom of Lombardy freed from Austrian authority; in short, the great Government of Italy was to be established. The first attempts at revolution were to be made at Bologna and in Calabria; but both failed, because persons who had undertaken to advance money in England, declined to fulfil their engagements. The paper goes on to say that the conspiracy exists now only in name, and that the persons at the head of it are determined to wait for a more favourable occasion. The same paper states that Lieut. Moro, one of the conspirators in the recent attempt was not killed as reported, but is in prison with the two sons of Admiral Bandiera, and that the King of Naples has granted a pardon to several of the Italian

refugees at Malta.—The Governor of Russi, a little town in the legation of Ravenna, in the Papal States, was recently killed in the streets with a pistol-shot, and another of the political prisoners, named Gardenghi, who was condemned to death by the military commission for the part they took in the insurrection of last year, has been executed at Bologna. A landed proprietor of the name of Mivelli has been sentenced for ten years to the galleys, for granting an asylum to one of the principal conspirators. Signor Gardenghi is the seventh of the political prisoners who has been shot in the back, that being the death of a traitor according to the Italian laws. —Letters from Rome of the 11th inst., state that the conduct of Lord Seaton, Lord High Commissioner of the Ionian Islands, as well as of the military commander, Major Frazer, during the expedition of the Italian refugees, has given rise to numerous communications between the Papal government and the court of St. James's, it being supposed that England might have prevented the expedition. The greater discontent is said to be felt at what has passed, because the Cabinet of London had solicited the intervention of the Pope, to calm the agitation in Ireland. The agent of the refugees at Corfu is an ex-Dominican, who has betrayed the order to which he belonged, and lends his house to the refugees, who hold meetings there.—We learn from Modena, July 6, that the reigning duke had been suffering severely from gastritis; but was then considered to be in a fair way of recovery.

TURKEY.—Letters from Constantinople of the 3d inst. announce the arrival in that capital on the 1st, of Wuschitch and Petroniewitch, the leaders in the last Servian revolution. They had long been seeking permission to plead their cause in person with the Divan for the restitution of their property and rights as Servian subjects. It is now said, that, failing to obtain any direct permission to that effect, they have risked throwing themselves on the mercy of the Turkish Government, and that there is no doubt they will find favour and protection from that quarter. Hussein, the ex-Pacha of Widdin, had made a visit of ceremony to the Porte. On account of his old age and infirmities, being afflicted with the palsy, he was carried into the presence of the Vizier on a litter, and was received with every demonstration of respect due to his years and long service. It is now confidently reported that his adopted son is the bridegroom elect of the Sultan's sister, and that the marriage will take place next month.—The *Toulonnais* of the 17th says that a Turkish fleet has left the Dardanelles for the coast of Syria. It is commanded by the Capitan-Pacha, and is composed of seven ships of the line, two frigates, two brigantines, a cutter, and a steamer. The same paper says, "The appearance of this fleet in present circumstances deserves to be noticed."

CAPE OF GOOD HOPE.—Papers from the Cape to the 18th May have been received this week. No news from Cape Town is published in these journals worth extract; but the frontier advices notice the re-appearance of the locusts in the neighbourhood of the Fish River, where they had commenced their ravages. H.M.S. Bittern had arrived at Algoa-bay, from Natal, with the Hon. Mr. Cloete on board, and by this opportunity accounts from that settlement had come down to the 22d April. All was peaceable in Pietermauritzburg, and the inhabitants had presented the English Commissioner before his departure with an address. Stock and corn thrive well in Natal, and the land is represented as extremely fertile. Coal, it is said, is most abundant, but unfortunately at present not discovered nearer than 80 miles from the coast. Great expectations are entertained that the mouth of the St. Lucia river (the Omvalozie of the natives) is navigable, and a cession of this spot, it is understood, has been made to England. One drawback, however, to all the advantages of this extensive country remains to be told—viz. that it is visited with violent thunderstorms, and these are very frequently attended with fatal consequences.—A letter from Ascension states that there was a great scarcity of water at that island, and that every one had been on allowance for three months. Vessels wanting water were obliged to go for a supply to Rio de Janeiro, and the cattle, sheep, and goats, were dying for want.

Parliament.

HOUSE OF LORDS.

Friday.—After the business reported in our last, Lord MONTEAGLE moved that the House resolve itself into a committee on the Art Unions Bill.—The Duke of CAMBRIDGE warmly supported the motion. His Royal Highness alluded to his exertions in forming and encouraging art unions, and to the great service derived from these institutions in diffusing a taste for the fine arts, as well as in remunerating artists. At the present moment, he said, there was a sum of 20,000*l.* locked up, which would otherwise be applied to the promotion of art, but which could not be so applied in consequence of the proceedings which had taken place. It was a great disadvantage to the artists of this country that this large sum of money was so locked up, and it was therefore desirable that this Bill should be passed as speedily as possible, as every one must be convinced that there could be no object in view in passing it, but the promotion of art. It appeared that all who were concerned in art-unions might be subject to the penalties of imprisonment—himself amongst others, and many of their lordships. All he could say was, that if he should be imprisoned for having violated the act in question, he would be imprisoned in very good company, and there were very few prisoners who could say so much as that. In conclusion, he prayed their lordships to pass this Bill with as little delay as possible.—The Marquises of NORTHAMPTON and LANSDOWNE approved the Bill, which went through committee without amendment.—Lord WHARNCLIFFE, in reply to the Marquis of LANSDOWNE, stated that the subject of the fees payable to the clerks of assize throughout the country was under the consideration of the Government, and they would prepare a measure to be introduced next session.—On the motion of Lord BEAUMONT, the Roman Catholic Penal Acts Repeal Bill was read a second time, on the understanding that those Acts only should be repealed which the LORD CHANCELLOR was satisfied ought to be repealed, leaving the Acts, about which he entertained doubts, to be considered in another session.—On the motion of the Duke of RICHMOND, the County Coroners Bill was read a second time. A great many Bills were brought up from the Commons, and read a first time.

Monday.—The first business was the Bill for preventing the further progress of the celebrated *Qui Tam* actions, and it was considered necessary that Mr. Russell, the plaintiff in 34 of these cases, should be required to give certain explanations respecting them. He was accordingly called to the bar, and Lord BROUGHAM proceeded to interrogate him. He had scarcely asked his first question, however, when the witness was ordered to withdraw; and Lord RADNOR, after a sharp censure on the Gaming Committee, protested against the further progress of the examination.—Lord BROUGHAM replied, asserting not only his right to question Mr. Russell, but the necessity of his evidence.—The Duke of RICHMOND and Lord EGLINTOUN vindicated themselves from Lord Radnor's insinuations; and it appearing, upon consideration, that there was nothing objectionable in the question proposed, the witness was recalled. His first answer, however, showed that the fact sought to be elicited was a privileged communication to him as an attorney, and he was again directed to withdraw. After some further remarks from Lord RADNOR and Lord BROUGHAM, the Bill passed through committee.—The LORD CHANCELLOR then, after briefly reciting the many enormities of which its constituency have been guilty, moved the second reading of the Bill for disfranchising the borough of Sudbury.—Lord BROUGHAM expressed his concurrence, and the Bill was read a second time without opposition.—The next measure was the Charitable Trusts Bill.—The Bishop of LONDON, Lord WROTTESLEY, and Lord CAMPBELL, approved some of its provisions, but all agreed in thinking that a Bill of such importance could not be sufficiently discussed at so late a period of the session, and especially in the absence of most of the Bishops. The Bill was accordingly postponed until next session.—The Art Unions Bill was read a third time and passed.—Several Bills were then forwarded a stage, but upon Lord BEAUMONT moving that his Bill for repealing the penal acts affecting Roman Catholics should be considered in committee, the Bishop of LONDON repeated the same objections which had been successful against the preceding measure. A measure that might go to no less than the establishment of the supremacy of the Pope in this realm, and which at one swoop repealed thirty Acts of Parliament affecting the most important interests of the Crown —the religion of the country—should not, under any circumstances, be hurried through Parliament at the end of the session, and in the absence of many of the Bishops. Some of the provisions of this Bill would interfere with the Act of Uniformity, and others with more recent enactments, including the great settlement of the question between their Roman Catholic and Protestant fellow-subjects. It would go to repeal those securities which were taken on the concession recently made to the Roman Catholics; and to this he, for one, was not prepared to consent —The LORD CHANCELLOR said, that in justice to himself and the Government, their lordships ought to allow the Bill as amended to be printed, and that then the right rev. prelate could afterwards pursue his opposition. The Bishop of LONDON then withdrew his opposition to this stage of the Bill, which passed through committee, and was ordered to be printed with the amendments made in it on the suggestion of the Lord Chancellor.—Lord TEYNHAM moved the second reading of his Chapels' Registration Bill.—The LORD CHANCELLOR opposed it, and the Bishop of GLOUCESTER moved its second reading that day three months.—The Bill was rejected without a division.

Tuesday.—The Colonial Postage and Assessed Taxes Composition Bills were read a third time and passed.—The Soap Allowances, the Loan Societies, the Parish Constables, the Western Australia, the Unlawful Oaths (Ireland), and the Farm Buildings Bills passed through committee.

Thursday.—The County Coroners Bill was read a third time and passed, after an unsuccessful attempt by the Marquess of NORMANBY to add a clause, restoring to County Coroners the mileage to which they were formerly entitled.—The Gaming Actions Suspension Act Continuance Bill was read a third time and passed.—The Earl of ABERDEEN laid on the table the code of instructions which have been drawn up for the guidance of the naval officers employed in the suppression of the slave trade. In doing so he stated that, notwithstanding our great exertions in putting down slavery, we were still very far from being completely successful. The annual average of slaves taken from Africa previous to 1830 was between 90,000 and 100,000. From 1830 to 1835 the annual average had decreased to 58,850. But from 1835 to 1840 the annual average again rose to upwards of 99,000. But since 1840, during the three years of the present administration, the annual average, he was happy to say, had descended to 28,000 —the numbers in 1842 being only 17,000, while in 1843 they had been as many as 38,000. His lordship attributed the increase of slaves last year to the necessary withdrawal of part of the cruising squadron from the coast of Brazil, in consequence of the hostilities going on betwixt Monte Video and Buenos Ayres, and likewise to the removal of General Vaidez from Cuba. Since the treaty of 1842 Portugal had acted with good faith, and her officers had co-operated with ours in putting down the slave-trade. A good understanding also existed between the United States squadron and our cruisers on the coast of Africa France had also shown a disposition to take a more active part in the suppression. But, on the other hand, Brazil and Spain had disregarded their treaties, and had given encouragement to the trade. These countries his lordship threatened in rather a sharp manner. He said that the course pursued since the change in the Government of Cuba, and the conduct pursued by the local authorities of Brazil, were such as he was unwilling to describe in the manner which he felt. These states must be made to recollect that with respect to the slave-trade this country had rights upon them. We had made treaties with them for the abolition of that trade as strong and as binding as could be treated for the cession of towns and provinces. If by a conquest founded on grounds of humanity we had made a treaty for certain rights, we had a right to enjoy the fruits of conquest. The treaty entered into with us the Powers in question must be prepared to fulfil, and he did trust that means would be found to make the stipulations solemnly entered into be honestly and faithfully fulfilled at last. Lord Aberdeen, in conclusion, stated that his plan of future operation would be a strict watching of the east and west coasts of Africa by a greater number of our cruisers, the force hitherto employed watching the coast of Brazil being of course diminished.—The Earl of MINTO, Lord COLCHESTER, and Lord BROUGHAM, congratulated the Foreign Secretary on the result of his labours, and thanked him for the code of instructions compiled under his directions.—The Earl of CLARENDON, while expressing his approbation of the course pursued by Government, feared that, without other and auxiliary efforts, failure would be the result. The only result, hitherto, of our vigilance, had been to increase the horrors of the "middle passage," for the slavers, to make up the losses caused by captures, increased the numbers of their living cargoes, and packed them closer, thereby augmenting the mortality. Our only real chance of suppressing the slave-trade was by proving to the world that free labour was more profitable, as well as more humane, than slave labour.—The new Creditor and Debtors Bill—that is, the measure approved by the select committee to whom the two Bills of Lord Cottenham and Lord Brougham were referred—was reported, on which a discussion arose, in which Lords BROUGHAM, COTTENHAM, CAMPBELL, and the LORD CHANCELLOR took part, the latter of whom stated that the present measure was Lord Brougham's, with the principle of Lord Cottenham's engrafted on it. The report was ultimately received, and the Sudbury Disfranchisement Bill, and the Western Australian Bill, were read a third time and passed.

Friday.—Lord WHARNCLIFFE moved that the House resolve itself into committee on the Party Processions (Ireland) Bill.—The Earl of WICKLOW was of opinion that the Bill should include every procession attended by party emblems; it would be infinitely better that the existing Bill should be allowed to expire, and that next session a new Bill, including all processions should be introduced. With that view he should move that the Bill be committed this day three months.—The Earl of RODEN seconded the amendment; he believed that by withdrawing the Bill, the greatest benefit would be conferred on persons of all parties.—The Duke of WELLINGTON claimed credit for the Government in having put down public processions in Ireland when they were likely to disturb the peace of the country. And he, further, gave credit to the people of Ireland for obeying the law. Her Majesty's Government looked forward to a period of peace and tranquillity, without having the necessity for those extraordinary powers contemplated by the noble earl. The Government had not come to Parliament for extraordinary powers even down to the period of the monster meetings. For his own part, he hoped the Bill would be allowed to go into committee.—The Marquis of CLANRICARDE and Lord WHARNCLIFFE supported the Bill; and the Amendment being negatived, the Bill passed through committee and was reported. [Left sitting.]

HOUSE OF COMMONS.

Friday.—In reply to Mr. DUNCOMBE's observations on the Irish trials, Sir R. PEEL said, that Lord Chief Justice Tindal remained in town to receive the opinions of the other Judges on the writ of error in Mr. O'Connell's case, and to communicate them to the House of Lords. As soon as the Judges had given in their opinions, the Lords would decide the question.—Captain FITZMAURICE moved for the appointment of a select committee to inquire into the dismissal of Mr. J. H. Rolls from the Custom-house.—The CHANCELLOR of the EXCHEQUER deprecated the interference of the House in such a case. Mr. Rolls had been offered a bribe by a person who had been engaged in extensive smuggling, which bribe Mr. Rolls had refused, but he had not informed against the person who offered it. Under these circumstances, though there was no imputation on the character of Mr. Rolls, the Board of Customs objected to his retaining his situation, and the Government did not think it right to press Mr. Rolls upon the Board. They had, however, offered him a situation in another department, with a salary equal to that which he had lately enjoyed. The motion was negatived without a division.—Mr. M. GIBSON moved an address to her Majesty, praying that a special commission be sent into the counties of Norfolk, Essex, Suffolk, and Cambridge, to inquire into the cause of the present incendiarism in those districts.—Sir J. GRAHAM gave the motion his most decided opposition. He said that both the motion and the speech just made were calculated to aggravate the evils complained of. There was such a thing as fanning the smouldering embers of discontent, and there were such persons as agitating Members of Parliament. —After a discussion, in which Mr. WODEHOUSE, Mr. DARBY, Mr. BRIGHT, Colonel RUSHBROOKE, Mr. BRAMSTON, Lord HENNIKER, Mr. VILLIERS, and Sir J. TYRRELL took part, the House divided—For the motion, 41; against it, 130. Majority against the motion, 89. The House then went into committee of supply. On the vote for education in England, Mr. WYSE brought forward the state of education in Ireland, and made several suggestions for making due provision to supply the deficiencies now existing in that regard.—Sir R. PEEL stated that he intended this year to increase the vote for education in Ireland from 50,000*l.* to 75,000*l.* As to elementary national education in Ireland, the tenth report of the commissioners showed that not only were schools and scholars increasing, but that the prejudices which prevailed against the board were rapidly subsiding; so far, therefore, the Government could congratulate themselves on the progress made in elementary education in Ireland. As to academical education in Ireland, he was convinced that its means were defective, and, though the Government were not prepared now with any plan to supply the deficiency, they had the question under their most serious consideration. As to the College of Maynooth, the Government felt that it was not satisfactorily supported, and that the amount voted to it was inadequate. Declining to indicate further the intentions of the Government, Sir R. Peel concluded by saying that the attention of the noble Lord who is about to assume the Administration of Ireland shall be directed to these subjects, and that, at an early period next session, the views and proposals of Government shall, if possible, be laid before the House. —Lord J. MANNERS expressed his cordial thanks to the Government for the announcement just made. He took it as an earnest of a better, more consistent, and more prosperous line of policy towards Ireland for the future. He looked upon it as an earnest that the Government were at last awakened to the necessity that existed of governing Ireland on the only sound and true principles on which that country could be governed—principles which the Right Hon. Baronet intimated would soon be carried into effect.—Lord PALMERSTON and Mr. SHEIL also approved of Sir R. Peel's declaration.—The vote for education in Great Britain, and also that for education in Ireland, were agreed to.—On the vote of 8928*l.* for the College of Maynooth, Mr. PLUMPTRE divided the committee. There were—For the vote, 87, against it, 30. Majority for the vote, 57. Several Bills were forwarded a stage.

Monday.—The report of the Poor-law Amendment Bill was postponed to Wednesday.—The two first clauses of the Joint-stock Banks Bill were agreed to in committee, and further progress was postponed.—The House went into committee on the Railways Bill, and Mr. GLADSTONE stated the principal alterations made in it. He said there was a material relaxation in the term of the option of revision or purchase—that was, that the right of purchase should not accrue until after 21 years, instead of 15 years, after the passing of the Act of Incorporation as originally intended. Another change was, that the right of revision being once exercised, should not be again exercised within the further term of 21 years. The Bill in its amended state provided that when a railway should be purchased, it should be taken at the value at which it might be estimated at the time of the purchase. He thought that an improvement in the Bill. Then again it was provided that if the railway at the expiration of 21 years should be making more than ten per cent. the transfer should be effected by the payment of 25 years' purchase.—All the clauses of the Bill were agreed to, after a series of unsuccessful amendments and one division on a proposition by Mr. THORNELY, that those companies which ran first and second class trains on a Sunday should be obliged to run third class trains also.—Mr. GLADSTONE objected against compelling any violation of the Lord's day, the observance of which was a great support to religion in this country, and a main support of it in Scotland.—Several Members contended for Mr. Thornely's principle; and Mr. SHEIL said, that otherwise Dives might travel on the Sunday, but Lazarus not.—The Committee divided, defeating Mr. GLADSTONE's opposition, and adopting the amendment. The Joint-stock Companies Remedies at Law and Equity Bill, and the Metropolitan Buildings Bill were read a third time and passed.—In reply to Captain PECHELL, Lord INGESTRE read a document signed by himself and Captain Henderson, relative to Captain Warner's experiment at Brighton. This document certified that the operations on the John o'Gaunt, 300 tons, conducted by Captain Warner, on Saturday, were under their management and control; that the explosion did not take place by combustible matter either on board the ship or otherwise; that Capt. Warner was on board the Wallace steamer, at a distance of 300 yards; that it took place in consequence of a signal from the writers on the shore, and that the time could not be known by Capt. Warner. They further declared their belief that since the vessel had left Gravesend Capt. Warner had not been on board of it.—On the order of the day for going into a committee of supply, Mr. SHEIL moved for certain papers connected with the proceedings of France in Western Africa. He began his speech by referring to some diplomatic remonstrance of Lord Aberdeen

with France in 1830. He complained that afterwards, when France had made, and held her footing there for some time, no further steps were taken to check her. The subject, however, he said, was renewed by Lord Aberdeen soon after his return to the Foreign-office. It was one of great importance with respect to the commerce of this country, which France by an ordinance, in 1843, had placed under serious disadvantages, while the naval force of England was left insufficient, and instead of being stationed in the Mediterranean to protect that commerce, was concentrated off the shores of Ireland. He saw much diplomatic endearment between France and England; but he did not see that England had gained anything through it. On the contrary, her Ministers had given way so far, as to take into their consideration the proposals of France for the abandonment of the right of search, and had suffered the Escurial to become an appurtenance of the Tuileries.—Sir R. PEEL regretted that such a discussion should have been mooted at this moment, when it was so important to prevent any angry feeling in the popular mind of either of the two countries. If he had intended mischief, which of course he did not, he could have taken no more direct way to do it than by thus counteracting the earnest endeavours of both Governments to prevent any hostile sentiment in either people. After the accession of Louis-Philippe, some representations on the subject of Algiers were made by Lord Aberdeen. A change in the British Ministry then took place; for eleven years Mr. Sheil's own friends were in office, and during that whole time they acquiesced in the occupation by France of her African territory, notwithstanding the fullest notice that she intended that occupation to be permanent. Nor, according to his judgment, had that Ministry, in so acquiescing, been guilty of any imprudence. He regretted that France had established the tariff now complained of, and this regret had been signified to her; but that was a totally different question from the question of right. He was under a great disadvantage here as opposed to the Right Hon. gentleman, who had it in his power to speak with entire freedom, while he himself, as a Minister, was compelled to employ a careful reserve; indeed, what he had said upon this subject a short time ago had already caused much misapprehension in the French Chambers. He denied the alleged insufficiency of the British navy, and repeated what he had lately said, that this country was now in a situation for making within a very short time, if it should be necessary, a naval demonstration worthy of her character. All that the Government had thought it requisite to do with respect to the African question, was to ask for a disclaimer from France of any intention to extend her territories in the direction of Tunis or of Morocco, and that disclaimer France had given.—Lord J. RUSSELL confessed that, in the present state of circumstances, he should not himself have thought it necessary to make any motion at all upon this subject; but Mr. Sheil, who had deemed it expedient to do so, had, at all events, used a becoming temperance of language. Perhaps the existing condition of affairs was not such as to exclude all apprehension; but he saw nothing at this moment which, in his judgment, made it necessary to press for papers. Besides, he could not help observing the existence of a blind war-party in France, whose urgency would be very embarrassing to the French Government, if that Government were pressed by England with any demand that should irritate the national feelings of the French people. On the subject of our naval force, however, he did not think there was the same need for delicacy. He then entered into a comparison between the amounts of our naval force in 1838 and in 1844, showing an advantage for 1838 upon the number of ships, censuring the Government for having reduced that number, and treating the present force as inadequate to the exigencies of the time.—Mr. MILNES opposed the motion, as leading to no practical advantage. Until England should recognise the French possession of Algiers, she had no very strong claim to commercial concessions from France. He did not regard the French movements in Africa with fear: they could not but be somewhat unpopular even among the French themselves, by reason of the blood and treasure which had been unproductively expended upon them.—Mr. HUME desired fuller information than Sir R. Peel seemed willing to give, respecting the amount of that naval force for which the country had voted so much money. For his own part, he was disposed to praise instead of blaming the Government for reducing the forces. A large force did but excite the jealousy of the irritable war party in France. He thought our naval establishments too large even now. Above all, however, he must deprecate any speeches that could excite angry feeling and tend to war.—Mr. MACKINNON regarded the French occupation of Algiers as advantageous to this country, by serving to employ the unquiet spirits of France. He considered it as a safety-valve.—Sir C. NAPIER thought, that the advantage of leaving a safety-valve for troublesome persons was more than balanced by the evil of keeping up the warlike tendencies of the French. He blamed the Government for having suffered our naval establishments to be so much diminished; and explained the principles on which a navy ought to be equipped and maintained.—Lord INGESTRIE insisted on the necessity of maintaining a considerable naval force, and of keeping that force from rusting by disuse.—Sir G. COCKBURN was still, as he had always been, of opinion that a considerable naval force ought to be maintained by this country; but, if her finances would not enable Government to do all which might be desirable, it was better to have, as now, fewer ships perfectly manned than more ships with imperfect complements. We had at this moment the most powerful steam-navy that any power possessed; and we could in a very short time send to sea a considerable fleet of ships-of-the-line.—Mr. M. O'FERRALL vindicated the course taken by Mr. Sheil, and defended the state of the navy as it was in the time of the late Ministry, when he himself was Secretary of the Admiralty. He disapproved the change of system which had since been introduced in that department.—Mr. S. HERBERT justified the system pursued by the present Admiralty. He stated that there was now an eagerness among seamen to man the ships of war: that a great number of vessels had been so repaired as to be equal to new ones: and that a vast addition had been made to the steam-power of the navy.—Captain PECHELL found fault with the conduct of the Admiralty.—Lord PALMERSTON justified Mr. Sheil for having made this motion. He considered the existence of the war-party in France as an additional reason for entering into discussions, which would show the force and the resolution of this country. He stated the substance of some correspondence which had passed upon the subject of Algiers between the Duke of Wellington's Ministry in 1830 and the Government of France; and defended the course taken by the subsequent Ministry in leaving the subject undisturbed. He blamed the present Government for the insufficiency of their naval force. They had mistaken the reverse of wrong for right, and had so overmanned their few ships, that there were on board more men than sleeping places. He believed that the best economy was to be well prepared with the means of naval defence, for peace was more likely to be preserved if those who might be disposed to attack you saw a strong force ready to resist them, than if your means of defence were so small as to invite insult.—The motion was negatived without a division; after which, at 11 o'clock, Mr. HUME brought on the motion, upon which the House had been counted out a few nights before, for an address to the Crown praying her Majesty to remodel the Royal Academy, with a view of rendering it more conducive to the advancement of the Fine Arts.—The Academy and the President were defended by Sir R. PEEL, who refused the motion and rebuked the mover, showing that the Academy were indebted to the public for nothing but the rooms they occupied; while the public, on the other hand, were indebted to the Academy for having, at their own expense, educated many hundred artists, and made provision for aged men of talent and for their widows.—Lord JOHN RUSSELL and Lord PALMERSTON took the same view with Sir Robert Peel, and the motion was negatived without a division by the general feeling of the House.—The House then went into committee of supply, and voted 4111*l.* for the Dublin School of Design.—Mr. WILLIAMS spoke highly of the results that had already attended the establishment of the Government Schools of Design, and hoped some extension of them would be resorted to, as the public money could not be better employed.—Mr. HUME, with reference to the preceding conversation that had taken place respecting the members of the Royal Academy, observed that an artist had the audacity to refuse an audience to two members of Parliament who desired to confer with him; and this, he thought, was carrying impudence to its utmost height.—Sir R. PEEL observed that the hon. Member had now substituted the word "impudence" in speaking of the members of the Royal Academy, for the term "audacity," which he had first used. He would not, however, quarrel with the hon. Gentleman, considering him to be a good judge as to how far impudence might be carried with impunity.—Mr. HUME said that if he had not had the impudence of the devil, he should never have done any good in that House.—2006*l.* were voted to pay for the services of certain professors in the Universities of Oxford and Cambridge.—2345*l.* to pay the salaries of certain officers in Scotland.—5420*l.* to defray the expenses of improving the harbour of Port Patrick.—8000*l.* having been proposed to defray the expenses of completing Lord Nelson's monument.—Mr. WYSE said he understood that an offer had been made by an artist, Mr. Patrick Park, to complete the monument gratuitously.—Sir R. PEEL said that such an offer was certainly made, but the Government thought it incumbent on them to decline that offer. He did not wish to say one word disparagingly of that particular artist, but he thought that nothing could be more unwise on the part of Government than to accept such gratuitous offers. He thought it infinitely better to open the work to public competition. Besides it would be a bad principle to allow an artist to go to an expense of 5000*l.* or 6000*l.*—Mr. WYSE believed the Government had acted properly, but he thought the artist entitled to great credit for having made such an offer, and at a time when there were not funds to complete the column.—Mr. G. KNIGHT hoped that as the height of the column was somewhat less than had been originally intended, the dimensions of the base and the size of the lions might also undergo some curtailment, in order that there might be no disproportion in the monument.—Sir R. PEEL had the satisfaction of informing his hon. friend that the size of the lions was an open question. Her Majesty's Government had taken the completion of the monument into their own hands, and would be unfettered by any particular plan.—Mr. B. COCHRANE inquired if the report were correct that the Emperor of Russia had subscribed 500*l.* towards the completion of the monument? If so, it was a great disgrace to this country to receive from a foreign country 500*l.* towards the erection of a national monument. He understood that the monument was twenty or thirty feet lower than the original design, in consequence of the committee not having sufficient funds.—Sir R. PEEL said the design of erecting a monument to Nelson was originally a private transaction, and the Emperor of Russia was one of those who was desirous of marking his respect for the memory of Lord Nelson by contributing 500*l.* towards the completion of the monument. The diminution in the height of the column was in consequence of the advice of two eminent men—one an architect, and the other an engineer—who gave it as their opinion that as there never was a Corinthian column of that height, they would not answer for its security in the event of one of those violent hurricanes which arise every twenty or thirty years. He thought every one should be grateful to the Emperor of Russia for the way in which he testified his gratitude for the courteous reception he met with in this country, and hoped the hon. member would not advise the committee to return the 500*l.* The vote was agreed to.—7524*l.* was voted for the purchase of pictures for the National Gallery.—6900*l.* to enable the trustees of the British Museum to purchase books, manuscripts, and coins.—80,000*l.* to defray the expenses of the British establishment at Hong-Kong.—149,000*l.* to defray the charge of the disembodied militia in Ireland; and 19,000*l.* for repairing damages in the gunpowder manufactories belonging to the Government.—The CHAIRMAN then reported progress, and several Bills were advanced a stage.

Tuesday.—The remaining clauses of the Joint-stock Banks Regulation Bill were agreed to in committee, and some additional clauses added to the Bill. The Joint-stock Companies Registration and Regulation Bill was recommitted, and a clause added extending its operation to Ireland.—The report of the Railways Bill was received, and the third reading fixed for Thursday.—Lord ASHLEY moved an address to the Crown, praying her Majesty to take the Lunacy Commissioners' report into consideration. He referred to a great variety of passages in that report, for the purpose of showing the inadequacy of the existing means to the due care of pauper lunatics, whose miserable condition in many parts of England he explained in detail. Their condition in Wales, both North and South, was described by him as still more wretched.—Sir J. GRAHAM gave the highest praise to the humane exertions of Lord Ashley. He considered it to be highly important that a curative process should be applied in the very commencement of disease; and that the curable patients should not be mixed with the incurable; and he felt that the time was not far distant when the Legislature must provide for these objects in the case of pauper lunatics, and for the due custody of criminal lunatics. The Government being fully disposed to take up the subject, he hoped the Noble Lord would not press his motion, the success of which might excite exaggerated expectations.—Mr. SHEIL hoped the Government would be prepared to extend the contemplated benefit to Ireland. He eulogised Lord Ashley's devotion to the cause of humanity.—Mr. WAKLEY insisted upon the importance of early attention to head affections—to those sensations of uneasiness in the forehead by which insanity almost always commenced.—Lord ELIOT said, that a provision for lunatics in Ireland was under the consideration of Government.—Several other members took part in the discussion, and Lord ASHLEY withdrew his motion.—Mr. T. DUNCOMBE moved for copies of all correspondence between the Government and the Lieutenant-Governor of Guernsey since the 1st of last August, insisting on the loyalty of the whole people of that island.—Sir J. GRAHAM declined to produce the papers, declaring that legal proceedings were still pending, in connexion with the recent plot against the life of the Lieutenant-Governor. He hoped, therefore, that Mr. Duncombe would abstain from pressing his motion.—Mr. DUNCOMBE acceded, but not without some strong observations upon one of the principal witnesses. This led to further explanations from Sir J. GRAHAM, and to some comments from Mr. HUME and Mr. AGLIONBY, after which the motion was withdrawn.—Dr. BOWRING called the attention of the House to the defective state of the quarantine laws, and the necessity and security of great modifications therein.—Mr. GLADSTONE said that the majority of opinions still inclined to the doctrine that the plague was communicated by contagion; and, therefore, it would not be prudent or practicable to attempt to precede the feelings and prejudices of other countries as well as those of our own. But our quarantine regulations had been considerably relaxed, and were far less restrictive than those of France or Austria. The Government, however, had invited these two Powers to a congress, in order that some general understanding might be come to on the subject. Both had assented, though the locality for the congress was not yet named; and Austria had suggested a preliminary medical inquiry. He was sanguine, however, that before the next session of Parliament the Government would be able to communicate the result, in the shape of an international reform of the whole system of quarantine.—Mr. Ross recapitulated those particulars in the conduct of Mr. O'Driscoll which have been the subject of so much animadversion, and for which Lord Chancellor Sugden removed him from the commission of the peace, the grounds assigned being his unfitness in temper, demeanour, and judgment, to exercise the functions of a magistrate. Yet six months afterwards he was restored, on the plea that his health was renovated, as if illness had been the superseding cause. These were not the times to tamper with the administration of justice amongst a population already sufficiently alienated; and censuring the Chancellor for weakly yielding to the influential names appended to a memorial, easily got up in Ireland, he moved an address to the Crown for the removal of Mr. O'Driscoll from the commission of the peace.—Mr. D. BROWNE seconded the motion.—Lord ELIOT, admitting the constitutional right of the House to interpose against every wrong, was yet of opinion that in order to justify an interference with any particular exercise of the prerogative, there ought to be proof that the prerogative had been exercised corruptly or improperly. He acknowledged that the conduct of Mr. O'Driscoll had been highly blameable; but thought it had been a good deal overstated. The Chancellor had removed him, not for any specific act, but for irritability, occasioned by recent ill-health, from which ill-health he afterwards recovered; and the Chancellor had then restored him, expressing a persuasion that what had passed would be a guarantee of his future discretion.—A discussion followed in which Mr. M. O'FERRALL, Sir J. GRAHAM, Mr. SHEIL, and Mr. BELLEW took part.—After which the House divided, when there were for the motion, 51; against it, 92; majority, 33.—On the motion of Colonel FOX, the correspondence with the Secretary of State relative to the charter granted to the Royal College of Surgeons was ordered.

Wednesday.—The Wales Turnpike Trusts Bill passed through committee.—The Corporate Offices Bill was read a second time.—On the motion of Mr. COWPER, the House went into committee on the Slaughtering of Horses Bill.—Before any progress was made Mr. T. DUNCOMBE moved that progress be reported, and divided the committee. There were for his motion, 11; against it, 104; majority, 93. The first clause was omitted, and the remaining clauses agreed to.—Mr. F. KELLY withdrew his Appeal in Criminal Cases Bill, on the promise given by Sir J. GRAHAM that the Government should take up the measure in the next session.—On the bringing up the report of the Poor Law Amendment Bill, Mr. BORTHWICK moved the addition of four clauses, viz., that suitable and decent accommodation should be provided in workhouses for every man and his wife aged more than 60 years each; that when from the infirmity of either, though below that age, the attendance of the other should be requisite, the arrangement should be the same as if both parties had been aged more than 60; that on a certificate from one magistrate, of a case of temporary infirmity or insufficient employment, the guardians should order out-door relief during the continuance of such suffering; and that children under seven should not be separated from their mothers being inmates of the same workhouse, with a provision for the convenient access of mothers to all children in the same workhouse aged under 13. Mr. Borthwick declared himself desirous to found his legislation upon two propositions—that the law ought not to separate husband and wife, nor parent and child; and that the workhouse ought not to be the lot of those who are in want from circumstances over which they have no control. If wealth had its duties as well as its privileges, poverty had its rights as well as its sufferings. It might be that the Commissioners or guardians would humanely provide in such individual cases for the objects he sought, but he preferred to secure them through the general sanction of the law.—Sir J. GRAHAM was not aware that any such provisions as had now been proposed were to be found in the old law. The guardians had power by the present law to give the proposed accommodation and relief to man and wife under the circumstances indicated in these clauses, and the access of mothers to children was also provided for; but the principle of Mr. Borthwick's third clause, for the general allowance of out-door relief, struck at the very root of the existing Poor Law. He referred to the great amount of out-door relief afforded under the existing law in proportion to the relief given in workhouses, and recommended it to the House to reject these clauses.—Lord J. MANNERS could not see why, if infringements of the law were sanctioned, changes in the law, in conformity with the authorised infringements, should not be made. The clauses proposed by Mr. Borthwick were in accordance with the principle of the ancient Poor Law, and, more important still, they were in accordance with the general feelings of the country.—Mr. HAWES, Mr. DARBY, Mr. WORTLEY, Lord STANLEY, Mr. B. DENISON, Mr. BROTHERTON, Col. ROLLESTON, Mr. P. HOWARD, and Mr. CURTEIS opposed the clauses: Mr. B. ESCOTT, Sir C. NAPIER, and Capt. PECHELL supported them. The House then divided on the first of Mr. Borthwick's clauses—For the clause, 32;—against it, 95;—majority against the clause, 63.—Mr. Borthwick having been defeated on the one declined to divide the House on his other clauses.—Mr. S. O'BRIEN moved the addition of a clause making it imperative on the Commissioners to provide chaplains for the several workhouses.—Sir J. GRAHAM feared that the interests of the Established Church would not be really promoted by any measure that should force all districts to pay for her particular form of worship. As the law now stood, the Commissioners had the power of directing the appointment of chaplains to any workhouses, though they had not the selection of the candidates, which belonged to the guardians; and, in fact, out of 513 unions having workhouses, there were 411 to which chaplains had thus already been voluntarily appointed. The proposed compulsion would but kindle a flame of religious discord throughout the kingdom. After some discussion the House divided—For the clause, 19: against it, 82:—majority, 63.—The further consideration of the report was adjourned.—The Clerk of the Crown in Chancery Bill was read a third time and passed.—The House went into committee of ways and means, and confirmed several grants that had been previously agreed to.—The Grand Jury Presentments (Dublin) Bill passed through committee.

Thursday.—The report of the Poor Law Amendment Bill was further considered. Several clauses were proposed and rejected—and two were added by Sir J. Graham. The object of one of these added clauses was to enable the guardians of any union to enter the asylum of such union for the purpose of inspection, the second provided that the Bill should not come into operation until the day after it received the Royal assent.—In reply to Mr. LABOUCHERE, Mr. GLADSTONE stated that persons residing at Java, but not holding any consular dignity, had been authorised by Her Majesty to perform the duty of giving certificates of the origin of sugars. The duty would be performed at Manilla by the Consul, whose salary was 1000*l.* a year, with an allowance for a clerk. In Java, at the three ports where Europeans were alone allowed to trade—Batavia, Samarang, and Sourabaya—the duty would be performed by gentlemen resident, namely, Messrs. Boncorn, M'Neill, and Frazer. The salaries of those gentlemen had not as yet been settled, but the maximum would be 200*l.* a year. Two of these gentlemen were merchants, and the other, Mr. Frazer, was not in business.—The Controverted Elections Bill passed through committee.—The Joint-Stock Companies Registration Bill, the Railways Bill, the Ecclesiastical Jurisdiction, and other Bills, were read a third time and passed.—The report of the Turnpike Trusts (Wales) Bill was received.—The House went into committee on the Criminal Justices (Middlesex) Bill. On clause 9, Mr. W. WILLIAMS moved an amendment to leave out the words which fixed the payment of the chairman's salary on the consolidated fund instead of on the county rate; and on this the committee divided, when the numbers were—For the amendment, 8; Against it, 43; Majority, 35. The remaining clauses were agreed to.—The Marriages (Ireland) Bill was read a second time.

Friday—After some discussion, the Reports on the Controverted Elections Bill was agreed to, the Bill ordered to be engrossed and read a third time on Monday.—On the order of the day for going into committee on the Savings Bank Bill, a long discussion arose on the management of these banks; and at length the House went into committee. On the first clause being read, which fixes the rate of interest to be paid to depositors at 3*l.* per cent., and 5*s.* per cent. for the expense of management., Sir E. COLEBROOKE said that he trusted the Chancellor of the Exchequer would consent to allow 6*s.* 8*d.* per cent. for the expenses of management, making in the whole 3*l.* 6*s.* 8*d.* per cent.—The CHANCELLOR of the EXCHEQUER was of opinion that 3*l.* 5*s.* per cent. for interest on deposits and expense of management was sufficient, and a fair allowance. — Sir T. ACLAND was certain that 5*s.* per cent. for management was not sufficient, particularly in banks where deposits were small in amount; he should, therefore, if no other member did, propose that the words 3*l.* 6*s.* 8*d.* be substituted for those of 3*l.* 5*s.*—Mr. LABOUCHERE said, if the House divided on the question he should vote for the larger sum.—The CHANCELLOR of the EXCHEQUER again stated, that he considered 3*l.* 5*s.* sufficient, and he must abide by that proposition.—Another discussion ensued, in which Sir T. Acland, Mr. Hawes, Mr. Hume, Lord Clive, Mr. Brotherton, Mr. T. S. Duncombe, Mr. Divett, Mr. Tuffnell, and other members took part, after which the committee divided.—For the amendment, 29; against it, 51; majority, 31. Some verbal amendments having been made, the clause was agreed to, and ordered to stand part of the Bill. On clause 2 being read, Mr. HUME moved that the words "2*l.* 18*s.* 4*d.*" be inserted in the clause, and he hoped the Chancellor of the Exchequer would not object to this amendment, the object of which was to secure to depositors in every case a minimum interest to that amount on every 100*l.* If this proposition was agreed to it would leave 6*s* 8*d.* in every 100*l.* for the expense of management, which he (Mr. Hume) thought fair and equitable.—Mr. HAWES did not believe that the expense of management could be brought within 6*s.* 8*d.*—The CHANCELLOR of the EXCHEQUER could not consent to the proposition. He must stand by the clause.—Another desultory conversation ensued, after which the Committee divided.—For the amendment, 14; against it, 58—Majority, 44. —After some verbal alterations the clause was agreed to, and ordered to stand part of the Bill.—Clause 3 was agreed to without any amendment.—The remaining clauses in the Bill, after a desultory conversation, were agreed to. Some new clauses were added, and the House resumed. The report was ordered to be received on Monday.—A new writ was ordered for the Borough of Cirencester in the room of Mr. Master, who has accepted the Chiltern Hundreds.—The Insolvent Debtors Bill was brought down from the Lords, read a first time, and ordered to be printed.—Sir J. GRAHAM moved the third reading of the Poor Law Amendment Bill.—Col. SIBTHORP said, he had opposed this obnoxious Bill in all its stages, and therefore he hoped that he had done his duty to the country, and particularly to the poor, and if he thought there was now any chance of success, he would divide the House against the measure on its last stage. He again regretted that he had no chance of success on a division, and therefore he took leave of the Bill.—Mr. B. COCHRANE was happy the Bill had been discussed in all its bearings. The amended Bill would be beneficial to the country, and he hoped to see next year many further amendments made. He trusted that the Secretary for the Home Department would give full effect to the sentiments he expressed during the debate, and that he would keep a strict and salutary control over the Poor-law Commissioners.—Mr. HUME regretted that such active means were taken by influential persons out of doors to prejudice and influence the poor against the Bill intended for their relief. It was the speeches of the opponents of the measure that prejudiced the public mind against its provisions.—Mr. HARDY said he originally opposed the New Poor Law Bill, but it had been so amended that he considered it would now work beneficially. He hoped next session to see the bastardy clauses, and the question relative to out-door relief, considered and amended. [Left sitting.]

Money Market, Friday. — Consols for the account closed at 99½. Red. Three per Cents. 100¼, Three-and-half per Cent. Red. 103. New Three-and-half per Cent. 102⅛. Bank Stock 199½. Exchequer Bills 78*s.* to 80*s.* prem.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. AVERY, Mincing lane, City, colonial broker—T. H. WHITHARSH, George-street, Hanover-square, hotel keeper—M. THOMPSON, Essex, ironmonger—J. PIM, Clapham-common, linen draper—J. B. LARKE, East Harling, Norfolk, draper—R. DREW, Compton street, Regent's-square, licensed victualler—J. DUNBAR, sen., Tottenham Court-road, iron founder—W. H. WILLIAMSON, Dowgate-hill, City, tobacconist—J. DUNKIN, Burford, Oxfordshire, victualler—E. A. HAW, Moorgate-street, City, tavern keeper—I. TOBIAS, Birmingham, factor—E. F. DAVIS, Bristol, ironmonger—J. ROYLE, Manchester, corn dealer—R. YALE, Leeds, Yorkshire, engineer—J. FAIRFIELD, Tranmere, Cheshire, corn-merchant—I. MUNRO, Princes street, Leicester-square, and Manchester-buildings, Westminster, builder—H. DEACON, Waterloo-road, coal-merchant—J. and R. DAVIES, Chiswell-street, linen drapers—G. MOORE, Middlesbrough, Yorkshire, grocer—G. CRAVEN, jun., and H. CRAVEN, Wakefield, Yorkshire, and Rochdale, Lancashire, corn millers and maltsters—R. WILLIAMS, Bristol, dealer in butter and cheese—M. M'DIVITT, Liverpool, merchant—T. B. ANDREW, Lancashire, tea-dealer—A. WATSON and G. and M. MACKENZIE, Liverpool, ship brokers—S. F. WILLIAMS, Liverpool, hosier.

SCOTTISH SEQUESTRATIONS.—P. MILLER, Forest, Dumfriesshire, cattle dealer—C. BROWN, Stranraer, watch-maker, deceased—A. THOMSON, Arbroath, tea-dealer.

Metropolis and its Vicinity.

Captain Warner's Invention.—The arrangements for exhibiting the destructive effects of the explosive power, invented by Capt. Warner, having been completed at Brighton in the course of last week, the experiment was appointed to take place on Saturday. The interest it excited was evident from the numbers of noblemen, members of Parliament, and naval and military officers who left London by the early trains, notwithstanding the disappointment of the preceding week. Brighton was in a state of excitement at an early hour. The cliffs, chain-pier, and parades were thronged with inhabitants and visitors. The ship on which the experiment was to be tried was the John o' Gaunt, which was anchored off Shoreham Harbour, with two steam-boats in attendance, and became an object of frequent and anxious observation as the appointed time for her destruction drew near. She was a barque, a vessel with three masts, of 300 tons burthen, and having only ballast on board, she stood high out of water. She had just returned from a voyage in the Levant, and was presented to Capt. Warner by Mr. Somes, the eminent shipowner, who being desirous that no further time should be lost in setting the question at rest by actual experiment, offered this vessel, that it might be subjected to the discharge of the explosive power. Mr. Somes, with the characteristic liberality of a British merchant, did not select an unseaworthy vessel for the purpose, the John o' Gaunt being, although an old vessel, strong and fit for sea, a proof of which is to be found in the fact that Mr. Somes was offered 1000*l.* for the vessel only a few days before he devoted her to destruction for the patriotic purpose of testing a discovery which promised to be of great national importance. It had been arranged that the signal for commencing operations should be given by Lord Ingestrie, Capt. Henderson, R.N., and Capt. Dickenson, R.N., by hoisting the union jack on the flag-staff at the battery; this signal was to be answered by Capt. Warner, by lowering the union jack flying from the mast-head of the steam-boat, to signify that he had commenced. At 4 o'clock the Sir William Wallace and Tees steamboats got under weigh, and proceeded to the vessel for the purpose of getting away the anchor and cables, and making fast a hawser, in order to tow the vessel off Brighton, but considerable delay occurred in effecting this, caused principally by a fresh breeze, and it was not till 5 that the crew on board the barque slipped her cables, when by the aid of telescopes, she was seen to move, being taken in tow by the Sir William Wallace, and expectation was now more than ever excited. There was a fresh breeze from S.W., but the barque had no sails set, although they were bent, and a strong current running against the vessel, she moved slowly towards Brighton, followed by the Tees, a small Shoreham steamer, engaged for the purpose of assisting to tow the vessel in case the weather became very rough, and in order to take away the boat when the two men who remained to steer the bark finally left her. Capt. Warner was on board the steamer which had the John o' Gaunt in tow, and shortly before 6 o'clock the ship arrived off the battery, at which were stationed Lord Ingestrie, and the other naval officers, who were to make the signal when they wished the operations to be directed against the vessel. At about 12 minutes to 6, Capt. Warner made his signal that he was ready, the John o' Gaunt being then about 500 yards from the steamer in which Capt. Warner was stationed, and still attached by a tow rope. In a few minutes subsequently the union jack on the flag-staff at the battery was lowered as a signal that it was time to commence operations, but this was answered by the steam boat hoisting her jack half mast high, to indicate that an unavoidable cause of delay existed. This was a cutter, whose crew, in order to watch the proceedings, sailed so close to the barque's quarter, that Capt. Warner feared that if he directed his power against the vessel whilst the cutter was so near, the lives of those on board the cutter would be exposed to great danger. The public anxiety was now at its height, and the crowds on the beach not knowing the cause of the delay, and having waited for two or three hours with great impatience, were more doubtful than ever of the success of the experiment. Those who were foremost in maintaining the powerlessness of the noiseless and invisible agent to destroy so powerful a fabric now triumphed in the delay, and numbers becoming fatigued, began to think of returning to London by the train which was soon to start. The cutter in the meantime got off to a considerable distance from the ship, which was about a mile distant from the shore, and Captain Warner let down his flag to indicate that he was ready to commence. This was not understood by the people on shore, and consequently attention was not generally revived by it, but suddenly, and with the quickness of lightning, a brown murky cloud surrounded the ship, and, unaccompanied by any noise except the dull crashing of riven timbers, sent up from its bosom high into the air the mainmast and all its attached spars splintered into fragments, and falling in a shower of *debris* around the vessel on all sides, but principally abaft. The cloud was immediately blown away by the strong breeze, and the ship was seen lurching so heavily to port, that persons on shore could see through the hatchway that a large portion of her starboard side was blown away, the principal direction of the force having taken effect under the main chains; her mizen-mast also had broken short off a few feet from the top, but the foremast, foretopmast, and foretop gallant mast still remained, the foremast being held by the forestay, which withstood the shock that destroyed all the other standing rigging. In a moment after the lurch she righted, and settled down rapidly for a few seconds, and then, again heeling over, she sunk in five fathoms water exactly in two minutes and a half after she had received the stroke of this strange and unaccountable force. Up to this time astonishment had held people nearly mute, but as soon as the vessel had sunk three thundering cheers were given for Capt. Warner. "Nothing," says the *Morning Chronicle*, from which we have borrowed this account, "could be imagined more striking than the sudden, noiseless, and complete destruction of the ship. It inspired a feeling almost of horror, occurring as it did without any of those concomitant incidents which usually are the accompaniment of a destructive explosion. No shell was thrown; nothing was ostensibly propelled from the steam-boat; no human agency appeared to be engaged against the vessel, and yet she crumbled to pieces more quickly than if struck by the whole broadside of a man-of-war." As might have been expected, numerous speculations are afloat as to the mode in which Captain Warner applied his discovery. Some have supposed that he had ignited some explosive substance on board the vessel previous to leaving her, but this has been set at rest by Mr. Walesby, the Middlesex magistrate, and late Anglo-Saxon Professor at Oxford, who states that Captain Warner was never once on board the John o' Gaunt from the time of her having left Gravesend, ten days before the experiment came off. In consequence of another report that the vessel was destroyed by means of voltaic electricity, Lord Ingestrie, M.P., Capt. Henderson, and Capt. Dickenson, have drawn up a declaration stating that the vessel was destroyed by some explosive projectile fired by Capt. Warner, on the external part of the vessel. It is right to state that the experiment of Saturday was in order to show the portion of the invention which may be applied at sea, in the blockade of towns, or defence of places from attack by sea. There is another application of the power, which is intended for a long range in the destruction of forts and places of strength.

Accident at Blackfriars Bridge.—On Monday evening a fatal accident took place at the steamboat pier, Blackfriars-bridge. It appears that some boats were about to start in a race from the opposite shore, and a crowd of people, principally composed of nursery maids and children, crowded to the steps which descend to the river, and filled up the floating pier, which at the best was never very secure, in such a way as to prevent the ingress and egress of passengers. The persons whose duty it was to keep the passage clear found the task utterly impossible, and the pier became crowded to excess. The tide had descended two or three feet, and began to run down rather rapidly, when the timbers which sustained the pier, and which had for a considerable time past been exposed to the action of the tide, suddenly gave way, and according to the most moderate calculation, upwards of 40 persons were precipitated into the river. Several scrambled out as they could, but the rush of the crowd on the steps to see what had occurred forced three or four children, who were standing on the steps, into the water. As soon as those who remained on the still floating portion of the pier recovered from the first consternation, they bestirred themselves actively to rescue the others, and several persons were dragged out of the water in a state of great exhaustion. In the course of a few hours seven bodies were found, but all attempts to resuscitate them were useless. During Monday night, and the whole of Tuesday, Bridge-street and its vicinity was thronged by crowds of persons, anxiously awaiting the finding of the bodies of friends or relations supposed to have perished. From the extraordinary number of inquiries made during the day, there is little doubt that many of the sufferers still remain unfound. If so, the bodies must have been carried away by the tide, and weeks may elapse before all are found. The pier extends near 100 feet into the river, being formed of old craft covered with deal planks, a kind of gangway uniting one barge with the other. Upon this gangway the people had collected, and on examining it by daylight, it appears to have been constructed of sound deal, which was originally about 1½ inch in thickness, but has been materially worn away, so that at the part broken it scarcely shows an inch in thickness. The cross pieces, or bearings beneath, are not very strong, and are rather wide apart. These and other details of the accident were stated in evidence at the inquest, which took place on Tuesday and Wednesday, on the bodies of the sufferers. After hearing all the evidence, the Coroner summed up at great length, and said that his reason for calling the inquest so early was for the purpose of quieting the public mind, by taking upon oath the statement of those who had witnessed the accident, so as to set at rest the various rumours which this melancholy occurrence had caused. If the persons were passing from the steam-boat to the land at the time of the accident, and lost their lives owing to the badness of the materials used for such purpose, then the case would have been one of manslaughter; but in the present case no one, he thought, was to blame but those who had gone on to the bridge in spite of the efforts of the men to dislodge them. The jury consulted for a short time, and returned a verdict of Accidental Death, with a recommendation that some stronger measures should be adopted by the city authorities to prevent children from playing upon the steps of the bridge or the pier. The investigation excited considerable interest, the jury-room being crowded to suffocation during the proceedings; and the Lord Mayor on Tuesday announced at the Mansion House, that the state of the steam-boat piers should receive the immediate attention of the city authorities.

Fête at Caen-Wood.—On Tuesday afternoon the Earl of Mansfield gave a *fête champêtre* at Caen-Wood, Hampstead, to several members of the Royal Family, above 700 of the aristocracy, and most of the foreign Ministers. The beautiful grounds have not been thrown open for a *fête* of this description since the 23d July, 1835, when the late King and Queen Adelaide honoured the late Earl by a visit. About 3 o'clock company began to arrive, and it was after 6 when the carriages discontinued to bring visitors. The Duke and Duchess of Cambridge, the Duchess of Gloucester, the Hereditary Grand Duke and Duchess of Mecklenburg Schwerin, and the Duke of Wellington, were among the earliest arrivals. The company sat down 500 at dinner, in a tent erected for the purpose, and after dinner dancing took place, which was kept up till nearly midnight. The whole of the grounds were brilliantly illuminated with variegated lamps, tastefully displayed in festoons from tree to tree, the "Lime Avenue" presenting a scene equal to Vauxhall in its best days. The border of every flower-bed was also marked out by a row of lamps of various colours, and every bush glistened with similar decorations. A display of fireworks took place on the margin of the lake at ten o'clock, shortly after which the Royal party took their departure.

Government School of Design.—On Wednesday the annual distribution of prizes to the pupils of this institution took place at Somerset-house. The hour fixed for the business of the day was four o'clock, and by that time the great room was filled almost to suffocation by

the pupils, and a large assemblage of members of Parliament, artists, and other distinguished personages, including several ladies. The walls of the room were covered with paintings in fresco, drawings, models, and other works of art, the productions of the students, most of which possessed a high degree of merit. The right hon. W. E. Gladstone presided, supported by the Earl of Westmoreland, Lords Dalhousie and Colborne, and other patrons of art.

Arrival of Sir Robert and Lady Sale.—On Monday Sir Robert and Lady Sale, and their widowed daughter, Mrs. Sturt, and child, landed at Lyme Regis, accompanied by Sir F. Ford, Capt. Scober, Capt. Ainslie, Mr. Robinson, and Mr. Remington. The gallant General and friends were landed by a Cowes pilot-boat, the True Briton, Indiaman, by which they arrived, being windbound in the Channel. As soon as their presence became known, the nobility and gentry of the neighbourhood, and the inhabitants of Lyme, vied with each other in offering their congratulations, and the church bells were rung. They left for London on Tuesday morning, amid the cheers of a great number of persons who assembled to witness their departure.

University of London.—The Senate of the University of London have recently come to the resolution of adopting academical costumes for the undergraduates and graduates of every degree conferred by that body. No collegiate dress has been hitherto worn by the members of this University.

Court Martial.—The sentence of the court-martial on First Lieut. Louis, Royal Marines, Woolwich division, for leaving his guard at the Victualling-yard, Deptford, without due authority, and for being absent therefrom when the fire took place on board the Madras on the 9th inst., was, that Lieut. Louis be cashiered; but in consequence of certain mitigatory circumstances which appeared in evidence, and the high testimony borne to his character by his commanding officer, he has been recommended to Her Majesty's favourable consideration, and the Queen has been pleased to order that he return to his duty, and be admonished to be more careful in future.

The Nelson Column.—A meeting of the Committee took place on Saturday at the National Gallery, Sir G. Cockburn in the chair, for the purpose of taking into consideration a communication transmitted by Government on the subject of the application made by the Committee, to the effect that Government would either supply the means of completing the Nelson monument, or take it wholly into their own hands. There were present, besides the chairman, the Marquess of Northampton, Lord Colborne, Lord Monteagle, Sir P. Laurie, Mr. S. Herbert, &c. The official letter from the Treasury stated that in 1816, the House of Commons having voted adequate sums for commemorating the great military victories which were achieved by the army of this country, there could be no doubt of the existence of a desire to perpetuate the memory of the naval valour by which England had been so eminently distinguished. It appeared, therefore, to Government, that the most advisable course for the Committee of the Nelson pillar, was to deposit whatever sums of money might be in the possession of the treasurer in the hands of the Commissioners of Woods and Forests, who would undertake the task of completing the monument. The letter alluded to the large sum of 20,000*l.* already subscribed by the public, and desired that all the drawings, plans, and documents, relative to the pillar, should be sent to the Commissioners. The meeting unanimously agreed to the suggestions in the official letter, and a general wish was expressed that upon the northern side of the pedestal, not only the name of Nelson, but the names of all the other eminent officers engaged in the battle of Trafalgar should be chiselled. It will be seen by our Parliamentary Report that the Lords of the Treasury, in accordance with the above statement, have obtained from Parliament a grant of 8000*l.* for the completion of the column. For a conversation on the plans to be pursued we must refer to our Parliamentary Report; it is, however, stated that the total sum required for the completion of the work is 12,095*l.*, viz., for granite steps, 3095*l.*; four commemorative subjects in bronze, 4000*l.*; four lions, 3000*l.*; architect's commission, 2000*l.* The Lords of the Treasury proposed a vote of 8000*l.*, which, with subscriptions in hand, is said to be sufficient for the purpose.

Arrival of Russian Gold.—The Aurora frigate is now at Gravesend, having brought here, on account of the Russian Government, bar gold to the amount, it is said, of 600,000*l.* sterling. The whole of this gold is the produce of the Oural Mountains, and it is rather finer than the standard. A portion of it will be applied, it is thought, to the purchase of rails for Russian railways, to be manufactured in this country, a project which augurs well for our iron-works. The produce of the Oural Mountains for the present year is estimated at about 4,000,000*l.* sterling. The gold brought over by the Aurora was contained in 80 boxes, which were conveyed in waggons to the Bank of England on Tuesday, strongly guarded by the police and military. On reaching that establishment the packages were taken from the waggons, and sealed in the presence of the principal officers of customs. The boxes weighed six tons, and were safely deposited in the vaults of the Bank of England.

Raising the Madras Transport Ship.—This vessel, which took fire and was scuttled off Deptford Dockyard, having a cargo of stores and ammunition on board for Her Majesty's troops at the island of Ascension, has been weighed by means of Government chain lighters from the Royal Dockyard. She is much burnt, more particularly in the fore part, and she has also received considerable damage by the chains which raised her slipping and breaking her upper parts. The stores are completely destroyed, and their loss will fall on the Government. The troops which she was to have conveyed from Gravesend to Hong-Kong have since sailed in another vessel.

The Distressed Needlewomen.—A deputation from the Society for the Employment of the Distressed Needlewomen in London, consisting of Lord Ashley, Alderman Farebrother, and other gentlemen, had an interview with Sir J. Graham, at the Home Office on Saturday last, upon the subject of the low prices for which work is taken in at the various prisons and other establishments, to the detriment of the industrious poor; when the Home Secretary expressed his anxious desire to afford all possible attention and assistance to remedy the evil complained of.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending July 20th:—West Districts, 141; Northern, 176; Central, 151; Eastern, 171; Southern 257; Total, 896. Weekly average for the last five years, 946.

Provincial News.

Bristol.—On Thursday and Friday last, Mr. Harrill brought to the hammer, in the large room at the White Lion, in this city, the manors of Chew Magna, North Elm, and Dundry, together with freehold estates, mansion houses, &c., at Chew Magna, Dundry, and Winford, the property of Mr. Harford, of the late firm of Harford, Davies, and Co., and sold by order of their assignees. There was considerable competition, and every lot was cleared, at prices, in many instances, far above the sum estimated by valuers. The total proceeds amount to upwards of 54,000*l.*

Bury.—The local papers contain accounts of a successful application of science in restoring to a perpendicular position the north wall of Market Weston Church, in this county. The church is supposed to have been erected in the 14th century. In 1630 it was injured by lightning, and again 10 years since it was much shattered by a thunder-storm. It was now necessary to effect a perfect restoration, as from age and the above casualties the north wall had declined outwardly 19 inches from the perpendicular, and threatened the destruction of the building. Under the superintendence of Mr. Cottingham, this wall (the weight of which had been calculated at 240 tons) was last week brought up to the perpendicular, by the process of expanding by heat three bars of iron, 2½ inches in diameter, which traversed and connected both walls of the church. These bars, which had screws worked on one end of them and projected beyond the south wall, were inclosed in cast iron boxes filled with lighted charcoal. When the bars were fully expanded by the heat, the screws were wound up firmly to the undamaged south wall. The charcoal boxes were then removed, and the process of cooling commenced. Gradually the bars contracting equally with their previous expansion, compelled the whole mass of the wall to follow, and in four successive operations the whole wall rose to its original perpendicular. Several of the surrounding families assembled at Weston, to witness the completion of this novel operation, the only previous instance of which had been performed at the Cathedral of Armagh, under the superintendence of the same architect.

Cambridge.—On Wednesday morning a destructive fire broke out at Toft in this county. It was first discovered in an open cart-lodge, at the back of the Red Lion public-house, and in consequence of the dryness of the buildings spread very rapidly to premises adjoining, consuming in its progress the dwelling-houses of nine families, together with three barns, several stables, and buildings of various descriptions, furniture, stock-in-trade, and a quantity of fine timber. The engines were soon brought into play, but owing to the scarcity of water were unable to stop the progress of the flames until property to the amount of 1500*l.* was entirely consumed. The local papers state that there is every reason to believe that it was the act of an incendiary.

Colchester.—On Wednesday morning an incendiary fire broke out at the extensive homestead of Mr. Green, of Greenstead-hall. The fire broke out in a large stack of old hay, and soon communicated to two other hay-stacks, containing between 80 and 90 tons, to a large bean-stack, the produce of 20 acres, and a straw-stack of about 140 tons. These were all in flames in about 15 minutes from the fire first being discovered, and from them the flames spread with the greatest rapidity to a barn, containing about 80 quarters of threshed wheat in the chaff, an extensive granary, containing about 100 coombs of beans, a considerable quantity of oats, sacks, and agricultural implements; the stables, a valuable waggon nearly new, a cart-lodge, an out-house, and shed, which were all consumed. The engines were ineffectual in the preservation of the above property, but they succeeded in saving the dwelling-house and furniture, and a range of agricultural buildings. It being a fair night, a great number of persons witnessed the fire, a large portion of whom evinced but little concern, while others took the opportunity to rob the house of plate, wine, and other valuables. Mr. Green's loss is covered by an insurance, but the premises are the property of Earl de Grey, and are not insured. The damage is estimated at 2000*l.*

Gravesend.—It will be in the recollection of our readers, that Mr. Richard Dadd the artist, who some months since in a fit of insanity murdered his father near Gravesend, and escaped to France, was apprehended in that country on a charge of injuring a person with whom he traveled in a diligence. For that offence he was by the French authorities committed to custody for a certain period, and that period having now expired, an officer of police has been despatched by Sir James Graham to claim his person, and to bring him over to this country. It is understood that he will on his arrival be brought to trial *pro formâ*, for the murder, with a view to his being confined in a lunatic asylum.

Oxford.—During the heavy thunder storm that raged in this city on Thursday week, the splendid tower of Magdalen College, 150 feet high, was struck by lightning, and one of the pinnacles much shattered, several large stones being hurled into the street. One of the servants of the college, who was passing at the time, had a narrow escape, being struck down by one of the fragments, which fell on his umbrella and hat, but he was not materially injured. The staircase of the tower, also, is much injured by some stones that were forced into it. The same turret, it is said, was struck in a similar way eight years ago, on St. Swithin's day.

Sandwich.—The *Canterbury Journal* states that on Wednesday week about noon a whirlwind arose near this place, attended by a water-spout, which passed within half a mile of the town. It came over a hay marsh, belonging to Mr. Gibbs, of Littlebourne, where some men had just commenced stacking the hay. A cart standing close by was carried the distance of three or four rods, and some of the hay as far as three miles, towards Minster. Some boys who were in the marsh were taken off their legs, thrown to the ground with great violence, and covered with hay. The haymakers, who were sitting quietly at dinner, were greatly alarmed; and still more so, when one of their baskets was borne off like a parachute to a considerable distance, and lodged in the river. A woman not far from the spot witnessed its flight, and thinking to recover the basket, hired a boat and proceeded to the Salts opposite, which she traversed for the space of two miles, but did not find it. She ran from her kneading trough after the basket, and by her return all her bread was heavy. The water-spout, in its course, sucked up every pond, and in crossing the river the water rushed up like a fountain. The phenomenon was exceedingly alarming, and it apparently burst at Minster.

Windsor.—On Saturday Elizabeth Blandy, a charwoman occasionally employed in Windsor Castle, was tried before the Recorder on the charge of stealing a piece of solid silver, forming a portion of the silver table presented by the corporation of London to King William III. It was stated on the part of the prosecution that the piece of silver was tied up in a paper parcel, and affixed to the table; that this was in a store-room which the prisoner washed out, and that she had since offered it for sale in the town. The prisoner declared that she found it by accident in the street, and after some consultation the Jury returned a verdict of Acquittal.—His Royal Highness Prince Albert, having determined to devote some portion of his leisure time to the management of bees, has caused a portion of the royal domains, in the vicinity of her Majesty's aviary, to be appropriated for the purpose of carrying this intention into effect. Two beautifully-constructed hives, of American manufacture, filled with bees, were brought to Windsor on Tuesday by Mr. Sholl, the patentee, and placed in the royal gardens at Frogmore, and they have since, by command of the Prince, been removed from Frogmore to the place assigned to them. The *Times* states that one of the hives is most ingeniously constructed from an American flour barrel, its entrance being so arranged as to afford efficient protection to its industrious tenants against the incursions of the bee moth. The other hive, which is very prettily ornamented, and constructed in the form of a temple, is transparent, a great portion being composed of glass, so that her Majesty and the infant royal family may have a continual fund of amusement in watching the internal economy of the hive, as seen through the glass windows at its sides and ends.—On Thursday the Bishop of Oxford consecrated a new church at Windsor, the foundation stone of which was laid by Prince Albert in April, 1842. A large number of the clergy and laymen of distinction were present at the ceremony. A fine organ has been erected in the church, presented by Mr. Jennings, brewer, of Windsor.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2919*l.*; Eastern Counties, 4895*l.*; Edinburgh and Glasgow, 2539*l.*; Great Western, 17,996*l.*; Grand Junction, 8680*l.*; Glasgow, Paisley, and Ayr, 1908*l.*; Great North of England, 1709*l.*; London and Birmingham, 18,161*l.*; South Western, 8443*l.*; Blackwall, 1578*l*; Greenwich, 872*l.*; Brighton, 4631*l.*; Croydon, 540*l.*; Liverpool and Manchester, 5416*l.*; Manchester, Leeds, and Hull, 7901*l.*; Manchester and Birmingham, 3298*l.*; Midland Counties, 10,152*l.*; Newcastle and Carlisle, 1880*l.*; Newcastle and Darlington, 699*l.*; Preston and Wyre, 510*l.*; South-Eastern and Dover, 5276*l.*; Sheffield and Manchester, 626*l.*; York and North Midland, with Leeds and Selby, 2783*l.*—The first half-yearly meeting since the amalgamation of the Midland Railway Company took place last week, and the dividends declared were as follows:—North Midland 100*l.* shares, 2*l.* 2*s.*; 50*l.* shares, 1*l.* 1*s.*; 33*l.* 6*s.* 8*d.* shares, 14*s.*, free of income tax; Midland Counties 100*l.* shares, 2*l.* 2*s.* 6*d.*; 25*l.* shares, 10*s.* 7½*d.*; and 2*l.* shares, 1*s.* 2*d.* and 2-5ths; Birmingham and Derby original shares, 1*l.* 6*s.* 6*d.*; third shares, 8*s.* 10*d.*; and eighth shares, 1*s* 3*d.*, income tax payable by the shareholders. The excess of traffic of the three companies, occasioned by the economical working of the lines, compared with the corresponding period of 1843, was 21,627*l.* 13*s.* 3*d.*, and the reduction in expenditure had

been 8985*l.* 14*s.* 6*d.*, while the net increase of divisable profits, exclusive of the last balance in hand, was 32,977*l.* 9*s.* 5*d.* The report submitted gave great satisfaction, and resolutions were carried, authorising the directors to follow out the branch lines through Swinton, Doncaster, Bawtry, to Lincoln, York, &c.—An arrangement, it is said, has been come to between the Greenwich and Croydon companies, the terms of which are, that the Croydon company takes the south line of rails to itself, for the purpose of laying down the atmospheric railway, and gives the Greenwich company 25,000*l.* towards the expenses of adding another pair of rails on the north of their line. The passengers are to come to London-bridge on the principle of a proportionate toll; in this manner 30 per cent. is to be deducted from the receipts for locomotive power, and the remainder is to be divided between the Greenwich and Croydon companies in proportion to the distance travelled on the Greenwich to that on the Croydon. For New-cross passengers the Greenwich will have 60 per cent. of 70 per cent. of the receipts, that is, 42 per cent. of the receipts, and for Croydon passengers 16 per cent. of the 70, or 11.2 per cent, of the gross receipts. —The Brussels papers state that the Belgian Government has been for some time engaged in a negotiation with the English Government for the purpose of establishing a daily post between Ostend and Dover. The subject has been followed up with so much activity, that there is every reason to believe that the railroad from London and those of Belgium and Germany will be placed in perfect communication. Last week an experimental voyage was made, which was completely successful. The new steam-boat the Princess Mary, the property of the Dover and London Railway Company, accomplished the passage between Dover and Ostend in 4½ hours. The Directors of the Dover Railway, M. Barcel, Chief of the Public Works, and M. Drouet, Secretary of the Belgian Legation in England, left London by the Dover Railway, at 20 minutes past 6 on Tuesday morning. The train arrived at Dover at 50 minutes past 8, after stopping at Folkestone 12 minutes; the Princess Mary was in readiness, and left Dover at 20 minutes past 9, and arrived at Ostend at 50 minutes past 1. The directors of the Dover Railway were there received by the director of the Belgian railways, the director of the Rhenish railways, the chief engineer, and the inspector. The passage from London to Ostend was thus completed in 7½ hours, including the embarkation and all stoppages, which occupied 40 minutes. The regular mail which left Dover at the same time with the Princess Mary, did not reach Ostend till 5 in the evening. By this conveyance the inhabitants of Brussels received at 6 in the evening, *The Times* published in London the same morning. It is impossible to anticipate the advantages which may arise by extending the operations of the English railways to those of Belgium and Germany. The third edition of the *Brussels Gazette* of the 16th inst. contained several extracts from *The Times* of the same day.—A considerable reduction of the fares between Liverpool and London is about to be made immediately, the directors of the Grand Junction and the London and Birmingham Railway Companies having both decided in favour of such a step. This is one of the first results of the understanding which now exists between the two companies.—A meeting was held at Dorchester on Friday of those persons who were favourable to what has been termed the coast line of railway from Southampton to that city. The Mayor of Dorchester was in the chair. The report of the committee, containing the reports of Capt. Moorsom and Mr. Pare, was read. Capt. Moorsom stated much in favour of that line to pass by Redbrook, Lyndhurst, Ringwood, Wimborne, Poole, and Wareham, and so to Dorchester, and from Dorchester, by atmospheric traction, over the hills to Weymouth. The expenses of the line between Southampton and Dorchester would be 450,000*l.*, and Dorchester to Weymouth 104 000*l* more. Mr. Pare's report stated that the traffic would amount to 48,752*l.*, and that the profit would be 6½ per cent. The committee strongly recommended the adoption of this line, and stated that they believed they should meet with the co-operation of the South Western Company. Lord Worsley moved the adoption of the report. It was very desirable that this county should have the advantage of railway communication with London and the south-eastern parts of England. It was of national importance that there should be a railway along the coast, in case of war or of vessels committing depredations. Captain Garland seconded the resolution. A long discussion then took place on the name of the line, and whether it could not go from Wareham to Weymouth, and so on to Bridport and Exeter, avoiding Dorchester. Mr. Hodding drew attention to the line from Salisbury, through Shaftesbury to Dorchester. Ultimately the name of the line was settled to be Southampton and Dorchester, and the resolution was carried unanimously.

IRELAND.

Dublin.—Lord Heytesbury, the newly-appointed Lord Lieutenant of Ireland, accompanied by his secretary, Mr. A'Court, left London on Thursday morning by railway for Liverpool. His Lordship was to embark in a Government steamer yesterday morning, proceed direct to Kingstown harbour, and thence to Dublin, to take upon himself the duties of his new office. Lady Heytesbury is gone to Brighton for a short period, and will join his Lordship in the course of the ensuing month.—The weekly meeting of the Repeal Association took place on Monday in Conciliation Hall, Captain Broderick in the chair. Mr. S. O'Brien, M.P., commenced the proceedings by reading a letter from the Repealers of Halifax, Nova Scotia, inclosing a subscription of 200*l.*, and announced the receipt of several sums transmitted to him during the week from the country. Sir V. Blake, M.P., read a letter from the Editor of the *Galway Vindicator*, tendering his resignation as a member of the Association; and proceeded to address the meeting on the subject of Repeal. He avowed himself an ardent Repealer—the advocate of an independent and unrestricted Parliament in College-green for the management of Irish affairs; but if it could be shown, as he thought it could, that they were entitled to something more than this federal Parliament, and that they could obtain something more, he felt assured that no member of that Association would object to join in an effort to procure all the advantages which he thought they had a right to claim. In his opinion they could obtain not only a federal independent Parliament, but also the right to send 105 delegates to the British Parliament to legislate on imperial matters, and prevent injurious interference with Irish affairs. The Irish Parliament would be selected from that Association, and the delegates to the English Legislature would be taken from the body so elected. Now, there was no doubt that these gentlemen would comprise a vast deal of the brains of the Irish Parliament, and he firmly believed the result would be that they would be able to guide and govern the British Parliament when they obtained admission to it. Mr. T. M'Nevin, barrister-at-law, brought forward a report on the national estimates, which, he stated, was drawn up for the purpose of showing the people how their money was spent, and of accustoming them to a manly and practical line of thought. He took occasion to give a history of the rise and progress of the national debt, and the cause which led to its accumulation from the earliest period to the present time. He described the English Army as being at present composed of the lowest and most disreputable portion of the population, at least in England, and applied such phrases to them as the following:—"The Butchers of Affghanistan," "the atrocities committed under the felon flag of England," "the murders of a featherbed people by felons engaged in support of an illegal traffic in opium," &c. Mr. S. O'Brien said, that the phrase "felon flag of England" was one requiring explanation. They did not speak of the English flag generally as being a felon flag, but they thought it became so when carried into such places as China and Affghanistan, and when innocent people were sacrificed. They could not approve of felony against nations any more than against individuals. Mr. Roche, M.P., subsequently, on behalf of Mr. M'Nevin, withdrew the phrase altogether, "because it was most important at the present period that they should keep within the limits of the law in this agitation, and not afford 'the enemy' any opening to attack them." Rev. Mr. Hearn, P.P., handed in 60*l.* from the Repealers of Manchester, and described the effect created by the incarceration of Mr. O'Connell. He was requested to convene a meeting for the purpose of recording the opinions of the friends of Ireland in Manchester on that subject. He did so, and he was happy to say that their first and second chairmen were justices of the peace. If a magistrate attended a monster meeting in Ireland he lost his commission, but in England it was otherwise; thus proving there was one law for England and another for Ireland. A struggle was at present going on between the colliers and the proprietors of mines, and he had to mention a circumstance connected with that struggle which might prove interesting to the people of this country. It appears that the Marquess of Londonderry, a person interested in the struggle to which he had alluded, was importing from his estates in this country numbers of labourers to supplant the refractory colliers. He was sure his Lordship had no claims on the sympathy of the people of this country, and he would therefore call on them not to second his views. Mr. S. O'Brien addressed the meeting at considerable length. He congratulated the assembly on the peaceable state of the country, as evinced by the assizes, and then proceeded to take a review of the present state of affairs. He concluded by asking what would be the position of the empire if the Irish should say, "You have trampled on our rights in peace, how can you ask us to shed our blood for you, or pay you taxes in war?" What would be the result if the Irish people acted thus? He would not, however, speculate on any such contingency, but he would tell the British Government this, that in order to obtain the support of the Irish people, which would enable them to defy the world, they should be prepared to consent to a repeal of the union. Mr. H. Grattan, M.P., addressed the meeting in an emphatic speech, and on concluding was loudly cheered. Mr. D. O'Connell made his usual weekly return from the prison, and said he was happy to inform the meeting that the "conspirators" still continued in the enjoyment of uninterrupted health; they were, in fact, daily improving. He then proceeded to read the opinions of his father on passing events. At the close of the meeting the week's rent was announced to be 1551*l.* 8*s.* 7*d.*

King's County.—At the Assizes on Thursday, the man named Dolan, charged with the murder of Lord Norbury was brought to trial before Mr. Justice Crampton, and a Jury consisting entirely of Protestants. The Solicitor-General stated the case, which occupied the entire day. No new facts or features were brought out, and Mr. Justice Crampton in charging the jury, said that there were certain admitted facts in the case which the jury should not for a moment lose sight of in coming to a just and fair conclusion. In the first place, the murder was committed on a certain day, and at a certain hour, whilst in company with his own steward, and in his own demesne. It was admitted, too, that the prisoner was seen near that place, both before and after the murder was committed, but in a dress wholly different from that which the assassin wore at the moment the shot was fired. In truth, the whole weight of the prosecution rested upon the evidence of Michael Day, and the woman Lynan. If the jury believed that those persons told the truth, there could be no doubt of the prisoner's guilt; but if they disbelieved them, or even had a doubt as to their accuracy or veracity, they would be bound to acquit the prisoner. The duty they had to perform was an awful one, and he was sure they would discharge it, regardless of all consideration but the evidence that had been submitted to them, which he would read over to them, leaving it then to their own consciences to draw conclusions. Great anxiety was evinced during the retirement of the jury, but when a verdict of Acquittal was pronounced, the astonishment was great and universal. It took every one by surprise, and none more so than the prisoner himself and his friends.

Limerick.—James and Mary O'Regan, Mary Burns, and Thomas Looney, were indicted for setting fire to the out-offices of the Earl of Dunraven, at Adare, on the 18th April last. The indictment contained four counts, in each of which Looney was charged with inciting the other prisoners to commit the outrage. Mr. Bennett, Q.C., stated the case, and observed, that it was one of the most extraordinary cases, perhaps, that had ever come before a jury. He said their motive was not so much hatred or enmity to the Earl of Dunraven, as to procure money from the Crown as approvers, procuring, in fact, the commission of a crime that they might become witnesses—a circumstance which rather aggravated their offence than otherwise. O'Regan had been an approver in the case of parties charged with firing with intent to kill, and he had been in the pay of Government, and had received all that it was determined to give him. The wife of O'Regan had also been a Crown witness, and was also paid off. Mary Burns was also a witness in the case of a robbery at Mr. Stafford O'Brien's, but being the only witness the case was not brought on. She, too, had been paid off. Looney, the fourth prisoner, had been also a witness in the case of the murder of Mr. Shine, and the concoctor of this conspiracy. He was paid off. Thus, these parties, having nothing more to get, and hoping by the commission of a crime to be taken again into the pay of the Government, they committed the act in question. Mary Regan's mother had heard them plotting the conspiracy, and they were to identify four persons out of a great number, to show the accuracy and veracity of their statement. A great number of witnesses having been examined, the judge recapitulated the evidence, and without leaving the box the jury found a verdict of guilty against all but Mary O'Regan.

Miscellaneous.

Old England.—At the recent meeting of the Agricultural Society at Southampton, Chevalier Bunsen, the Prussian Minister, alluded in striking terms to the kindred love of country life which prevails in this country and in Prussia, "those countries" as he called them, "of good old Saxon blood." He said that "perhaps they would allow him to tell them an anecdote of the King of Prussia, his royal master, when upon his late visit to this country. When visiting the splendid establishment of Eton, and gazing from one of the old gothic windows upon the magnificent scene around him—the ancient structure in which he stood the fields and woods smiling around it, and the happy faces of the boys gazing up to his—looking at this union of old and new, he exclaimed, "Blessed is the country where the old is ever new, and where the new is ever entwined with the old."

Arson, &c.—Mr. Ewart has procured a Parliamentary return, showing the number of persons committed, convicted, and executed for arson, and other wilful burning in England and Wales, during each of the six years which have elapsed since 1837, when the law was mitigated, with the total numbers; also, the number of persons committed, convicted, and executed for arson, and other wilful burning, in England and Wales, during each of the six years preceding the year 1837, when the law was mitigated, with the total numbers; likewise the centesimal proportions of convictions to commitments during each period of six years preceding and following the mitigation of the law. It appears that in the six years *since* 1837, when the law was mitigated, 344 were committed, of which 117 were convicted; not one was executed. The centesimal proportion of convictions to commitments, from 1838 to 1843, was 34.01; and from 1831 to 1835, 24.14.

A Submarine Forest.—About 1500 men are at present engaged in completing and repairing the great Caledonian canal, and their operations have in some respects been facilitated by the late drought, which has reduced the waters of Loch Oich to a lower level than remembered in the memory of man, and thus rendered more easy the removal of a subaquatic forest which has been discovered in the course of the channel through that lake. Some hundreds of trees of all sizes have been dragged out of this watery bed, where they had lain for centuries, consisting chiefly of the finest black oak—some of the logs 3½ feet in diameter, others 25 to 30 feet long, and several in high preservation, whilst others were charred by fire. A few logs, artificially hollowed out, apparently to serve as canoes, were also got.—*Glasgow Courier.*

Law.

SUMMER ASSIZES.—MIDLAND CIRCUIT, LINCOLN.—*Murder.*—Immediately before the rising of the Court, a distressing spectacle

was presented. Eliza Joyce, aged 31, a mild and not uninteresting looking woman, the wife of a gardener, at Boston, was arraigned and pleaded guilty to two indictments, charging the crime of wilful murder. The first indictment charged the murdering by poison (laudanum) in October, 1841, of Emma Joyce, aged 18 months, the child of her husband by a former marriage. The second indictment charged the murdering by poison (laudanum) in January, 1842, of Ann Joyce, aged six weeks, her own offspring by her marriage. The unhappy woman was arraigned at the spring assizes last year, upon the charge of administering to Edward William Joyce (a child of her husband's, of some years' growth) arsenic, whereby his death was caused, and to that indictment pleaded not guilty, and thereon, in consequence of proof to the name of William only, and not of Edward William, being offered, she was discharged, sureties being taken for her appearance to take her trial at the next assizes. She was again arraigned thereon at the summer assizes of last year, but owing, however, to some defect in the proof, was acquitted. So strong, however, was the impression on the mind of her husband of her guilt, that he refused to live with her, and she went to the Boston Union, where being attacked with a severe fit of illness, she confessed to having murdered the two children mentioned in the indictment. The prisoner was habited in deep mourning, and as she appeared in the dock was evidently suffering acutely, both in body and mind. She was obliged to be accommodated with a chair. Having pleaded guilty to the charges against her, the Judge, in passing sentence, observed the present was one of the most distressing cases it had been his lot to witness since he had sat upon the Bench. By her own confession, she had not only destroyed the life of an infant, to whom she was bound to have been a protector, but she had not hesitated to sacrifice her own offspring, and that without any conceivable reason. He could hold out no hopes of mercy to her in this life: she must therefore prepare to meet her God. Mr. Justice Coltman then passed upon the prisoner the last sentence of the law that she be hung, nothing being audible beyond the Judge's voice but the sobs of the guilty woman in the dock.

OXFORD CIRCUIT, OXFORD.—*Exeter College* v. *Butler and others.*—The plaintiffs were the rector and scholars of the College, and the defendants the churchwardens of the parish of St. Michael. The action was brought nominally to recover compensation for an alleged trespass committed by the defendants in seizing, under a distress for poor rates, a portion of the College plate, but in reality the proceedings were instituted in order to determine the liability of collegiate property to parochial burdens. In 1771, thirteen parishes of the city of Oxford, many of which were small in point both of limits and expenditure, determined to unite into one body, at the suggestion of some of the parishioners, who considered that benefit would accrue to the whole by such coalition; and accordingly, by an Act of Parliament passed in that year, eleven were united (two of the thirteen only remaining aloof), and these eleven formed a federal board, each parish still electing a certain number of guardians, the mayor for the time being, being also a member of the board. The mode in which the parochial government was conducted under the operation of this statute was as follows:—The guardians determined on the sum to be raised, whereupon they issued their precept to the churchwardens of each parish, who were bound to collect the sum directed to be levied in their respective districts, there being one poor house common to the whole, and the funds being finally distributed by a common board of guardians. Latterly some members of this board thought that there was good reason for obtaining a share of the expenses of maintaining the poor from the several colleges, although other individuals of that body expressed disapprobation at such a step. The necessary proceedings, in order to set at rest the point thus raised, were in the first place to impose a rate upon collegiate property. Exeter College had hitherto been rated for chambers, garden, coach-house, stable, and yard only; the guardians in their new rate wished, therefore, to introduce additions, in consequence of an increase in the value of the property belonging to the College. A parishioner of the name of Hunt appealed against the rate thus made, upon the ground that Exeter College was not sufficiently rated, and the proper authorities of the College were served with notices of appeal; that appeal, in due course, came on before Mr. Sergeant Manning, the Recorder of Oxford, the churchwardens and overseers appearing before him on the occasion, but no one attending on behalf of the College, as that body denied the recorder's jurisdiction, and the University, at the same time, claimed exclusive cognisance of the matter. The learned sergeant declined to act upon or to allow this claim, heard the appeal, and amended the rate, adding thereto the rector's house, garden, yard, &c., and increasing the amount upwards of 19*l.* Demand was made upon the College for this amount thus increased; payment was refused, and an amicable arrangement for a distress having been made, a quantity of college plate, purposely and voluntarily selected, was seized, in order that, by the decision of a superior court, the important question might be set at rest. On the part of the defendants it was contended that the statute of Elizabeth presented the first system for making all property beneficially enjoyed contribute to one great fund for the relief of the poor, and therefore no property but that immediately in the hands of the Crown could be exempt from parochial rates; that there was nothing in the nature of this property which could show any colour of exemption. It was, moreover, alleged that the College had already conceded its liability by paying a portion of the rate; that that additional portion of the edifice on which the increased rate was now demanded, was not extra-parochial, and was not, therefore, by the accident of position, prevented from contributing, but was equally liable with the rest. The main question for present consideration was simply, whether or not Exeter College, at the time of making the rate, were part and parcel of the parish of St. Michael. Exeter College was originally founded by Bishop Stapylton, the scholars being termed, "Scholars of Stapleton-hall," and the building, as similar edifices almost universally were, was at first merely a hostelry, or place of accommodation for the students, whose pursuits and avocations led them to the precincts of the University. From the piety and munificence of succeeding generations, the institution deriving accumulated wealth and possessions, its limits gradually increased, and in addition to that portion of ground held by the college in fee, other parts were held of the city, under different tenures and for various terms, the whole of which, with the exception of certain immunities claimed by the plaintiffs as thereunto attached, were located within the ambit of the perambulations, which, on the Holy Thursday in each year, are continued for the purpose of keeping alive the remembrance of the limits of the parish. As many as five centuries ago there was a small parish called St. Mildred the Virgin, the church pertaining to which stood near Lincoln College; and it was alleged by the plaintiffs that that portion of Exeter College on which it was now sought to impose a rate was included in this parish, which, it was contended, existed until the year 1459 or 1460, when, together with St. Michael's parish, it merged into or was united with that of All Saints, by a deed of the Bishop of Lincoln.—The evidence called on behalf of the defendants was, of necessity, exceedingly prolix and tedious, and wholly devoid of interest. The examination of the numerous witnesses occupied the time of the Court until half-past five, and the defendants having closed their case, the Court adjourned until the following morning, when the Jury, after remaining a short time in deliberation, found a special verdict of three several facts, which amounted in substance to a verdict for the plaintiffs.—WORCESTER.—*Perjury.*—On Tuesday, *Mr. Augustus Newton*, the barrister, who has recently been so frequently a party in the Courts of Law, was tried for perjury. The proceedings arose out of the arrest of the accused some time ago at Cheltenham for debt, and some subsequent affidavits which he made to have the arrest set aside. The Judge (Mr. Sergeant Atcherley) who tried the case, after the evidence had been taken, told the jury that he thought the evidence insufficient to support the indictment, at the same time he considered the case one very proper to be inquired into. The jury thereupon returned a verdict of Not Guilty.

NORTHERN CIRCUIT, YORK.—*The Bradford Murder.—John O'Bryan, Thomas Ragan, Daniel Power, William Quinn*, and *Daniel Donovan*, were indicted with a person named *M'Cann*, who was not in custody, for the wilful murder of Benjamin Gott, at Bradford. The particulars of this affair were given in our Paper of 8th and 15th June. The dispute which led to the death of the deceased, arose out of a party procession on Whit Monday, during which several party tunes offensive to the Irish were played. A number of Irish labourers attacked the band, and deceased, who was one of the musicians, was killed. The jury, after two days' trial, found all the prisoners guilty of manslaughter. The sentence was deferred, and on the prisoners being subsequently brought up for judgment, Mr. Heaton stated that he had to move in arrest of judgment on several objections which he wished to take to the indictment, and the further proceedings in the case were postponed.—*William Maton, George Taylor*, and *Richard Winker*, were indicted for feloniously cutting and wounding John Massey, at Sheffield, on the 4th July, with intent to do him some grievous bodily harm. It appeared that the prisoners were engaged at the Duke of Norfolk's collieries and struck work, that several new hands had been taken on to supply their place, but the prisoners attacked them and compelled them to leave the place. The violence of the prisoners and the other rioters was so great, that it was necessary to call out the military. The jury found them all guilty, and they were sentenced to be transported for 15 years.

NORFOLK CIRCUIT, CAMBRIDGE.—*Arson.—Fanny Rutherford*, a young girl of 15, was charged with setting fire to an outhouse, whereby five cottages were burnt to the ground. Several witnesses proved that within a minute after the prisoner had been seen to enter and quit a certain outhouse attached to her father's cottage, and close to which was a furze-stack, a fire burst out. While the flames were in progress, and after they had spent their utmost fury on the property set forth in the indictment, the prisoner was quietly amusing herself in the street, playing and romping about with other children. In addition to these facts, various witnesses deposed to her having given contradictory statements relative to her proceedings just before the fire; and the jury having, without much hesitation, returned a verdict of guilty, the prisoner was sentenced to fifteen years' transportation.—IPSWICH.—*Arson.—Ann Manning*, aged 32, was indicted for having set fire to a dwelling-house in Wangford, on the 25th of June last, the property of James Rathen. From the statement of the prosecutor and others, it appeared that the husband of the prisoner, being in prison on some charge connected with the game laws, left his wife and infant family in the occupation of his cottage in the deepest distress and want. In this state of things there was great difficulty in her satisfying the rent due to the landlord, who at length put in a distress on the premises on the 10th June, there being then 2*l.* 7*s.* 6*d.* due. While the distress was in the prisoner sent for the prosecutor, and told him she should not suffer her things to stir before her husband came out of prison. The prosecutor said he had now no control over the matter, and the law must take its course; upon which she replied, that before he had her things she would burn them in the middle of the room, and his old house too. In spite of this, the goods were sold on the 17th, with the exception of a few articles of wearing apparel. Though she afterwards asked the prosecutor to take as many of the things as would pay the rent, on the morning of the 25th the house was found to be in flames, the fire having originated evidently from the inside of the roof. An inquiry was set on foot, and the prisoner then denied having had any fire in the house on the day in question; but she refused to show the officers where the fire had burst out. When before the magistrate, the prisoner made a statement to the effect that, "as she was going into the union house on the following day, she had, on the morning of the 25th, put an old mattrass into the oven to burn;" but several witnesses deposed to the total absence of any marks of fire having been seen in the oven. In the course of the trial, it appeared that though the goods seized realised 2*l.* 19*s.*, the prosecutor only received 18*s.* towards his rent, the great balance being all absorbed in the expenses of the distress, a fact which seemed to excite great surprise in the mind of the judge. Mr. Palmer then addressed the jury on behalf of the prisoner, and called upon them to view the case with mercy and compassion, and contended that there was really no evidence against his client, but the declarations proved against her, which were rather to be considered as the offspring of anger than of any determined intention to commit the outrage imputed to her. The learned judge then briefly recapitulated the chief points in the case to the jury, who, he said, were not to be swayed, while inquiring into the truth, by those moving topics to which counsel had called their attention. If they saw any reasonable doubt of the prisoner's guilt on the evidence, they would give her the benefit of that doubt; but if they did not, their duty was to find her guilty, and leave any circumstances of mitigation or compassion which might exist to the consideration of the proper tribunal. The jury ultimately returned a verdict of guilty, accompanied by a strong recommendation to mercy. Mr. Baron Alderson: I quite agree with your verdict, gentlemen, in both its branches. The case is one which does call for mercy and compassion, and I will take the matter into my consideration before I pass sentence on the prisoner.—*David Clow*, aged 40, was indicted for feloniously setting fire to a shop, the property of James Heffer, at Farnham, in this county, on the 18th inst. It appeared that the prisoner, whose family occupied the "town-house," near the premises of the prosecutor, had recently taken upon himself to erect a straw hovel or "lean-to" against one side of the prosecutor's shop, in which he used to pass the nights. On the night in question he was overheard to grumble to himself, "I'll go and burn down the whole set of them; I'll set fire to the straw shed." This he said about twelve o'clock, as he was going towards the hovel. In a short time afterwards he went to the window of the "town-house," somewhat tipsy, and asked for a light for his candle. Having been accommodated with a light, he crossed the yard towards his bed-room, and was there lost sight of. In about three-quarters of an hour the premises were discovered to be on fire, and the prisoner was seen hurrying out of the yard half-dressed, and with his clothes on fire. On this fact coming out, Mr. Baron Alderson inquired of the jury whether they were not satisfied that the fire originated in accident, not design? The man was "somewhat tipsy," and the fire did not break out for three quarters of an hour after he went to bed. What more likely than that he fell asleep, and set fire to the bed and his own clothes too? A juror said that he should think so too, but for the expression of the prisoner. Mr. Baron Alderson: I think that that is rather favourable than otherwise to the prisoner, as it was decidedly the conduct of a drunken man. However, if the jury wish it, the case shall go on. The jury then consulted, and in a few moments said they were quite satisfied, and returned a verdict of Not guilty.

SPORTING.

TATTERSALL'S, THURSDAY.—*Goodwood Stakes.*—7 to 2 agst. Mr. Wreford's Franchise (takers 4 to 1); 6 to 1 agst. Lord G. Bentinck's Crotan Oil (7 to 1 t. free); 9 to 1 agst. Mr. Johnstone's The Æra (t. and aft. off.); 10 to 1 agst. Mr. Meiklam's The Best of Three (t. and aft. off.); 11 to 1 agst. Colonel Peel's Canton; 12 to 1 agst. Mr. Irvin's Pride of Kildare (t. and aft. off.); 13 to 1 agst Colonel Anson's Parthian (taken); 16 to 1 agst. Lord Exeter's Elegance filly (taken); 18 to 1 agst. Mr. Shelley's Lucy Banks (taken); 20 to 1 agst. Mr. Mostyn's Murton Lordship (t. freely); 29 to 1 agst. Sir S. Spry's Subduer; 200 even between Canton and the best of Three.—*Goodwood Cup.*—Even on Mr. Salvin's Alice Hawthorn; 6 to 1 agst. Lord Chesterfield's Prizefighter (taken); 17 to 1 agst. Mr. Quartermaine's Discount (take 20 to 1).—*St. Leger.*—4 to 1 agst. Mr. Savile's The Cure (t. and aft. off.); 4 to 1 agst. Lord Stanley's Ithuriel (t. and aft. off.); 9 to 1 agst. Lord Chesterfield's The Princess; 1000 to 25 agst. Mr. Vane's Valerian.

BIRTHS.—On the 13th inst., at Long Bennington, near Grantham, Mrs. R. WINDOW, of a son—16th inst., at East Malling, Kent, the lady of T. H. HUTCHINSON, Esq., of a son—17th inst., at 2, Abercromby square, Liverpool, the lady of M. SYNNOT, Esq., of a daughter—18th inst., at Rutland-gate, Hyde Park, Mrs. S. H. GODSON, of a son—18th inst., at the Vicarage, Whaplode, Lincolnshire, the lady of the Rev. T. T. SMITH, of a son—18th inst., at the Vicarage, New Shoreham, Sussex, the lady of the Rev. J. BLAIR, of a son—19th inst., the lady of J. SHEPHARD, Esq., of Kensington square, of twin daughters.

MARRIAGES.—On the 9th inst., at 71, Dean-street, A. B. WHYTE, merchant, in Aberdeen, to ELEANOR MORE, youngest daughter of the late A. More, Esq., collector of customs at the port of Aberdeen—10th inst., in St. Peter's Church, Dublin, J. H. KEANE, Esq., eldest son of Sir R. Keane, of Cappoquin House, in the county of Waterford, Bart., to LAURA KEATINGE, eldest daughter of the Right Hon. R. Keatinge, Judge of the Prerogative Court in Ireland—11th inst., at St. Mary's, Cheltenham, G. R. L. ANNESLEY, Esq., Lieutenant in the Austrian Cavalry, son of the late Hon. R. Annesley, and nephew of the late Earl Annesley, to MILLICENT M. FRENCH, daughter of the late M. M. French, Esq., of the county of Derby.

DEATHS.—On the 11th inst., at Keith-hall, Aberdeenshire, the EARL OF KINTORE—12th inst., at Brighton, T. BOLDING, Esq., late of Great Linford, in the county of Buckingham, aged 45—13th inst., at Kensington, EMILY BUCHANAN, youngest surviving daughter of the late Lieutenant-Col. G. Buchanan, Royal Engineers—13th inst., in Oxford-square, Hyde Park, ANN PEARSE, widow of J. Pearse, Esq., late of Craig's-court, Charing Cross—13th inst., at Billericay, Essex, Mrs. E. SPITTY, relict of T. Spitty, Esq., aged 82—13th inst., S. CLARK, Esq., Purser, R.N., aged 55—13th inst., at Pembroke, Mrs. HODGES, relict of the late G. R. Hodges, Esq., aged 88—13th inst., at Grove-lane terrace, Camberwell, ELIZ. C. MELVILL, relict of P. Melvill, Esq., Lieutenant-Governor of Pendennis Castle, Cornwall, aged 74—13th inst., at Stoke, Kent, T. COMPORT, Esq., second son of T. Comport, Esq., of Whitehall, Hoo, aged 55—16th inst., at Beaufort-cottage, Wellington-road, Bow, A. BYRCH, Esq., aged 29—17th inst., at the house of her son, the Rev. Walter Oke Croggon, Dublin, ANNE CROGGON, relict of the late Mr. T. Croggon, of Beresford-street, Walworth, formerly of Penryn, Cornwall, aged 90—18th inst., at Kensington, G. REYNOLDS, second son of F. Reynolds, Esq., aged 13—18th inst., H. HURWITZ, Esq., Professor of Hebrew at University College, London—19th inst., at Epsom, G. B. BARCLAY, eldest son of G. P. Barclay, Esq., of that place, aged 24.

TO MARKET FARMERS.

WANTED A PARTNERSHIP OR SUCCESSORSHIP in a Market Farm, within 10 miles from London. Address, with Particulars, to X. Y., Post-office, Guildford.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER OR FOREMAN.—A Single Man, age 25, who has had good practical experience in his business, and has lived in the above situation. Can have a good character.—Direct to S. S., Mr. Dennis, Nurserymen and Florist, King's-road, Chelsea.

AS GARDENER.—A married Man, 27 years of age, without incumbrance. He perfectly understands his business in all its various branches. Can have 2 years' good character from the place he is about to leave. A single-handed place objected to. Direct A. B., Mr. TRIPE's, Upper Sydenham, Kent, near London.

AS GARDENER.—A Native of Scotland, who perfectly understands his profession in all its various branches, possesses a general knowledge of plants, and has had extensive experience in the formation and alteration of pleasure-grounds, flower-gardens, &c. Can have a most satisfactory character from his last employer, where his practice was varied and extensive. Address to A. G., Mr. Moore's, 9, Munster Street, Regent's Park, London.

AS GARDENER.—A young Man, a native of Scotland, without incumbrance, who has had nine years' experience, and can undertake the business in all its different branches. Can be well recommended by his last employer.—Direct to J. D., No. 7, New Grove, Homerton, Hackney.

AS GARDENER.—A married Man, aged 34,—one child; has a thorough practical knowledge of his business in all its Departments; would be found useful where improvements are contemplated, as he possesses a knowledge of Horticultural Building, and also the Application of Heat by Hot Water. Unexceptionable testimonials can be given.—Direct to X. Z., Mr. WILMER, Nurseryman, King's Road, Chelsea.

AS GARDENER.—A Single, Middle-aged Man, who thoroughly understands his business, the management of Pines, Grapes, and Forcing in general. Likewise Kitchen and Flower-garden, &c. Can have an unexceptionable character from his last situation, in which he has been living with a respectable family in Cornwall.—Direct to A. B., at Mr. Weaver's, Porter Merchant, New-street, Penzance, Cornwall.

AS GARDENER OR BAILIFF, in a Nobleman or Gentleman's Family, a native of Scotland, married, without encumbrance, 32 years of age, who understands the various branches, and can have unexceptionable characters from his late masters in Scotland and England.—Direct to W. G., Mr. Laing's Nursery, Twickenham, Middlesex.

AS GARDENER.—A respectable Married Man, aged 36, whose abilities and character will bear the strictest investigation from the gentleman he is now leaving, on account of making alterations in his establishment.—Direct to A. B., P. Novelli, Esq., Wood House, Dulwich, Surrey.

AS UNDER-GARDENER.—A young Man of good experience is in want of the above Situation, and would have no objection to pay to any nobleman or gentleman's gardener five pounds for a situation of the above description, where he could get further knowledge of his business.—Direct to R. W., 4, Chapel-court, New-road, Chelsea, London.

AS BAILIFF.—A single Man, aged 35, who has a practical knowledge of the East Lothian system of Farming, having been brought up to it from his youth; the Rearing and Feeding of Stock, and is quite conversant with the new system of Draining and Laying out Pasture-Lands—is desirous to engage with any Nobleman or Gentleman in the above capacity. Can produce the most unexceptionable references as to character and abilities.—Direct to R. M., Bartletfield, near Bridge of Earne, Perthshire.

TO SEEDSMEN.

AS SHOPMAN.—A young Man, 25 years of age, is desirous of obtaining a situation as above, or to assist in the warehouse. He can be well recommended by the gentleman with whom he has lived two years, and has every knowledge of the business.—Direct to A. B., at Messrs. RONALD'S, New Brentford, Middlesex.

A YOUTH of good Education, and of respectable parents, wanted as an Apprentice in a Nursery and Seed Establishment in the vicinity of London, where a general stock is kept, particularly in the Plant department. A considerable premium will be expected.—Direct to Messrs. WARNCH, Seedsmen, London-bridge, stating age, &c.

INGA PULCHERRIMA. (Figured in "Paxton's Magazine of Botany" for August, 1844.)—Fine Plants of this extremely elegant and beautiful Exotic, with most of the other new and rare Plants of the season, may be obtained of the undersigned, at the following low prices:—

Inga pulcherrima, 7*s.* 6*d.*
Achimenes picta, 10*s.* 6*d.*
Æschynanthus Horsfieldii, 7*s.* 6*d.*
Amycia zygomeris, 7*s.* 6*d.*
Clerodendron splendens, 10*s.* 6*d.*
squamatum, 5*s.*
Hindsia, or Rondeletia longiflora, 15*s.*
Epacris campanulata rosea (the finest selected from 1000 seedlings), 7*s.* 6*d.*
Habrothamnus elegans, 15*s.*
Tremandra Hugelii, 10*s.* 6*d.* to 21*s.*
Veronica speciosa, 5*s.* to 15*s.*
Erica elegans, fine and healthy, 15*s.*, 24*s.*, and 30*s.* per doz.

THOMAS JACKSON, Kingston Nursery, Surrey, August 1.

WOODLANDS NURSERY, Maresfield, near Uckfield, Sussex
VERBENA HUDSONII.

WM. WOOD AND SON, having purchased the entire stock of the above magnificent VERBENA, beg leave to solicit attention to Dr. LINDLEY's opinion of it in the *Gardeners' Chronicle*, July 6th, p. 448.

"*W. W.*—HUDSONII is a good variety, bright rosy purple, with a white eye, distinct in colour." To which description W. W. & S. may be allowed to add, that the flowers are large and very showy; it has been seen by several competent judges, who have pronounced it to be a variety of first-rate merit. Plants will be ready for sending out on the 20th August next, packed in tin cases and forwarded post-free, at 3*s.* 6*d.* each, with the usual allowance to the Trade when six plants or more are taken at once.

A remittance will be expected from un known correspondents.

MR. LYNE'S NEW SEEDLING GERANIUMS.

WILLIAM E. RENDLE has much pleasure in offering to the Nobility, Amateurs, and Trade the following new varieties of GERANIUMS raised by P. E. Lyne, Esq., the entire stock of which he has succeeded in obtaining.

		£	s.
Lyne's Princess Alice	each	1	1
Lyne's White Perfection	,,	1	1
Lyne's Imogene	,,	1	1
Lyne's King of Saxony	,,	1	1
Lyne's Redworth	,,	1	1
Lyne's Confidence	,,	1	1
Lyne's Sappho	,,	1	1

The whole set as above for six guineas. The usual discount to the Trade.

"Princess Alice" has received two seedling prizes in London. "White Perfection," first prize at Torquay, and the Gold Medal at Plymouth. "Imogene" is described in the *Chronicle*, June 24th, 1843. They all possess most desirable properties, and can be highly recommended as being first rate flowers.

W. E. R. has been induced to offer the above at prices considerably lower than usually obtained for such valuable varieties, in hopes thereby to meet with a more extensive demand. Descriptions can be obtained on application.

Orders will be executed in strict precedence. Plants will be delivered in October next. Reference or remittance required from unknown correspondents. Plants will be added to compensate for carriage.—Union Road Nursery, Plymouth, July 26

SPLENDID NEW SEEDLING CINERARIAS.

MICHAEL BREWER, Sen., begs to return his best thanks to his numerous friends who last season favoured him with their orders, and to apprise them that in addition to his own extensive List of varied Self and party-coloured new and truly splendid Seedlings of the present year, he made purchase of every new advertised and well-described kind, which having propagated and seeded to great extent, he is now prepared to execute orders for strong seedling plants, fit for furnishing to the Greenhouse, through the autumn and winter months, a varied, lively, and continuance of elegant bloom, comprising every shade of deep rich purple, dark and light blue, &c., at 9*s.* per doz., basket, &c. included. Also seed of the same, which he confidently recommends on account of all being grown mixed together. Mixed and collected in packets, 2*s.* 6*d.* each.

Letters, inclosing post-office orders or stamps, will be immediately attended to.—Nursery, London-road, Cambridge.

CAMELLIA.—A Seedling CAMELLIA, raised by a gentleman in the neighbourhood of Manchester, and named "Duke of Lancaster," a drawing of which may be seen at Mr. J. W. DRAPER'S, Covent Garden, London, from whom further information may be obtained; also at R. S. YATES'S, St. Ann's-square, Manchester.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

NURSERYMEN AND FLORISTS TO HER MAJESTY THE QUEEN.

YOUELL AND CO.'s splendid and extensive Collection of CARNATIONS, PICOTEES, and FUCHSIAS is now in Bloom, to which they beg to invite the attention of Amateurs and others. Upwards of 3000 pots of Carnations and Picotees will be staged, comprising all the leading varieties in cultivation, and embracing several new Picotees of the highest merit, raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, to which first-class Prizes have already been awarded.

Steamers from London Bridge and St. Katherine's Wharf every Tuesday and Saturday evenings at 6 o'clock. Coaches from Spread Eagle, Gracechurch-street, *viâ* Eastern Counties Railway every morning and evening at 8 o'clock.

Y. and Co.'s Collection of Fuchsias continue to be forwarded per post, free, to any part of the United Kingdom, at the following prices:—12 extra fine varieties, containing most of the new kinds sent out this season, for 21*s.*; 12 fine ditto, 12*s.*

The Carnations and Picotees will be ready for delivery the latter part of September, at the following prices:—12 pairs extra fine and superb Show Flowers, 2*l.* 10*s.*; 25 ditto ditto ditto, 5*l.*; 12 very fine ditto, 1*l.* 10*s.*; 25 ditto ditto, 3*l.*

Great Yarmouth Nursery, August 1, 1844.

J. AND J. FAIRBAIRN, beg most respectfully to acquaint their friends and the public, that they have now many very interesting specimens of HEATHS in flower, which they feel assured will be found worthy of inspection. Open every day, (Sundays excepted) admission gratis.—Nurseries, Clapham, near London, July 30, 1844.

THUNBERGIA CHRYSOPS.

W. SKIRVING, NURSERY AND SEEDSMAN, Walton, near Liverpool, begs to offer the above new and splendid Climber, surpassing in beauty all others of the genus yet introduced. It is a native of Sierra Leone; a perennial of strong and shrubby habit, and a free bloomer. Colour, dazzling purple, with rich yellow eye. Raised at Knowsley Hall, from seed imported by the Right Hon. the Earl of Derby, and presented to W. S. by his lordship. Plants are now ready to be sent out at 10*s.* 6*d.* each.

Orders accompanied with a remittance or a respectable reference, will be faithfully and promptly executed.—Walton Nursery, 25th July, 1844.

T. AND J. BACKHOUSE, NURSERY & SEEDSMEN, York, beg to offer to the notice of the Public their following fine SEEDLING PANSIES.—

YORKSHIRE ECLIPSE.—"No. 1 is a large flower, of good form, white ground, blue purple upper petals, and broad margin of the same round the lower petals; the petals meet well above the eye; a good flower." 3*s.* 6*d.*

BEAUTY OF HOLDGATE.—"No. 2 is your best flower; the eye large and intensely dark, ground light buff, belting purple, upper petals the same; a brilliant and striking flower." 3*s.* 6*d.* (See *Gardeners' Chronicle*. p. 230, for 1844.)

EARL OF ZETLAND is a flower of excellent form, yellow ground, bronzy crimson upper petals, with broad belting of the same round the lower petals, which meets well above the eye; a distinct and very constant show flower. 3*s.* 6*d.*

Strong plants are now ready for sending out, postage free when three or more plants are taken. A remittance required from unknown correspondents.

TO NOBLEMEN AND GENTLEMEN'S GARDENERS.

EARLY POTATO SEED.—M. SMITH having been very successful in raising Early Potatoes from the Seed of the Potato Plum, is happy in being able to offer Potatoes for seed of so early and fine a quality as has not been equalled. The first is his six weeks Dwarf Seedling. This is a very fine early Potato; so early that with ordinary cultivation it will be ready for use in six weeks from the time of planting. It is particularly well adapted for forcing, being so dwarfish in the stem as not to exceed from four to six inches in height. The Potato is very shallow-eyed, and of first-rate quality, but not large, the largest being about the size of a bantam's egg.—Price 20*s.* the imperial pound.

Second, his prize-taking Seedling. This is a very early, large, and fine Potato; shallow eyed. It has taken the first prize at the Berwickshire Horticultural Shows during the last two years for its size, beauty, and good quality.—Price 15*s.* the imperial stone.

Third, his second Early Seedling. This is a Potato of first-rate quality, comes in class after the Prize-taker; is a rich bearer and shallow-eyed, making up the blank between the first Early and what is commonly termed American or Second Early.—Price 15*s.* the imperial stone.

Those wishing to be supplied with seed of any of the above Seedling Potatoes will address their order to Mr. Smith, Gardener, Ayton, Berwickshire, with a Post-office order for the amount of their demand. They are requested to give their address distinctly, that the Potatoes may be forwarded without delay to the proper quarter. Early application will be necessary to obtain a supply, as the stock is limited.

All orders will be punctually attended to, and the Potatoes forwarded, packed in boxes, with moss or hay, to protect them from injury by carriage. Ayton, July 15, 1844. M. SMITH.

THE WALCHEREN C. FLOWER.

MESSRS. MARNOCK AN[D] HANLEY beg to inform their friends and the [p]ublic that they have a few packets of the above genuine articl[e] which should be sown for a general crop to stand the win[ter] from the 12th to the 20th of August. Owing to the excessive [wet] season, the spring sowing has not turned out so favourable [as] it otherwise would have done; but they will warrant it to answ[er] every description given of it in their treatise.—Nursery, Hack[ney], July 31, 1844.

SHILLING'S QUEEN CABBAGE.—This month and part of August being the time to sow Cabbage Seed for the Autumn and Spring Planting, J. & S. SHILLING having a little Seed left of the above very superior kind, which they highly recommend to those who have not already tried it, beg to offer it to the Public generally, in half oz. packets, postage free, at 2*s.* 6*d.* each, on the receipt of postage stamps or a Post-office order.—Northwarnborough Nurseries. Odiham, Hants.

*** Agent for London, Mr. KERNAN, 4, Great Russell-street, Covent Garden.

JESSOP'S NURSERY, Cheltenham, Established in 1815, from its extensive connection, offers peculiar advantages to Noblemen and Gentlemen requiring Gardeners, Foresters, or Farm-bailiffs, of established skill and reputation. All communications promptly attended to.

THE HAMPSHIRE BROWN COS LETTUCE.—The middle to the end of August being the time for sowing Lettuce Seed to stand the winter, J. and S. SHILLING invite the attention of the Public generally to the above, which they can with confidence recommend as superior to any other kind for winter and summer use. It is quite hardy, and will not run to seed. They have sent a few heads to Mr. Kernan's, No. 4, Great Russell-street, Covent Garden, where it may be seen. ½ oz. packets at 2*s.* 6*d.* each, free, on the receipt of postage stamps or a Post-office order.

P.S.—Mr. Kernan is Agent for this as well as for their Queen Cabbage.—Northwarnbro' Nurseries, Odiham, Hants, Aug. 1.

BENTALL'S IMPROVED PAPER FOR DRYING PLANTS.

W. AND T. BENTALL earnestly invite the attention of Botanists to the above Paper; its perfect adaptation to the purpose for which it is prepared having been fully proved. The following valuable testimonial has been lately received:—

"I highly approve of your new Paper for drying plants, and consider it far preferable to the Cambridge Chalk Paper, which I previously employed, but which will now be entirely discarded by me in the preparation of plants for the herbarium. I have also found it most valuable in drying Algæ, the most decisive test, in my opinion, to which such papers can be subjected; and can safely recommend it to all engaged in the study of these plants."—*Rev. W. S. Hore, M.A. F.L.S., &c., Stoke, Devonport.*

Professor LINDLEY, C. C. BABINGTON, Esq., M.A. F.L.S. &c., H. C. WATSON, Esq., F.L.S. &c., have also kindly allowed the use of their names as strongly recommending it. To be had of the Manufacturers, Halstead, Essex; and of their Agents, Mr. E. NEWMAN, 9, Devonshire-street, Bishopsgate, London; and Mr. R. S. MCINTOSH, 12, Catherine-street, Edinburgh.

Sizes, 16 by 10 inches (when folded), 14*s.* per ream; 20 by 12 inches, 20*s.* do.; 16 by 20 inches, 25*s.* do.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND-MACHINE, for depositing all kinds of Seed on the various Soils, with the greatest accuracy and despatch.—This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of Seed intended to be planted, into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kind of Garden Seeds. 1*l.* 10*s.* each. Commission allowed to Agents.

These Dibbles may be obtained through the agency of the principal Agricultural Implement Sellers, in the United Kingdom; or from the Inventor, by letter, to his address, inclosing a Post-office order for the amount. RICHARD SMITH,
Upper Hall, near Droitwich, Worcestershire.

LYNDON'S PATENT SPADE.—Sold by GREEN and CONSTABLE, Ironmongers, 35, King William-st., London-bridge. Horticultural Tool Chests, Bright Ladies' Spades, Money's Patent Water Pots, Lord Vernon's Patent Hoes, with a general assortment of Garden Implements.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

TO HORTICULTURAL BUILDERS.

A GENTLEMAN wishes for a PLAN and ESTIMATE for a small GREENHOUSE or CONSERVATORY, to be erected at the end of his Drawing-room (which end faces the west, and the front the south, and from which a door of communication opens), size 15 feet 6 inches by 12 feet; there is a return wall of 5 feet to be glazed with Drake's Sheet Glass, and finished in the best manner.—Direct to E. L., at the Office of this Paper.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made and glazed from 1*s.* per foot, at JAS. WATTS' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—ANNUAL COUNTRY MEETING of 1845, to be held at SHREWSBURY, in the North Wales District, comprising the Counties of Anglesey, Carnarvon, Merioneth, Montgomery, Denbigh, Flint, Chester, Salop, and Stafford. The Prizes are open to general competition. Forms of Certificate to be procured on application to the Secretary, 12, Hanover-square, London. All Certificates for Implements must be returned, filled up, to the Secretary, on or before the 1st of May, and all other Certificates by the 1st of June; the Council having decided that in no case whatever shall any Certificate be received after those dates respectively.

PRIZES FOR IMPROVING THE BREED OF CATTLE.—1845.

Short-horns.—CLASS 1. To the owner of the best Bull calved previously to the 1st of January, 1843, 30*l.*; to the owner of the second best do. do., 15*l.*—2. To the owner of the best Bull calved since the 1st of January, 1843, and more than one year old, 20*l.*—3. To the owner of the best Cow in milk or in calf, 15*l.* (In case of the Cow being in calf, and not in milk, the Prize will not be given until she is certified to have produced a calf.)—4. To the owner of the best in-calf Heifer, not exceeding three years old, 15*l.*—5. To the owner of the best Yearling Heifer, 10*l.*—6. To the owner of the best Bull-calf, not exceeding one year old, 10*l.*

Herefords.—CLASS 1. To the owner of the best Bull calved previously to the 1st of January, 1843, 30*l.*; to the owner of the second best do. do., 15*l.*—2. To the owner of the best Bull calved since the 1st of January, 1843, and more than one year old, 20*l.*—3. To the owner of the best Cow in milk or in calf, 15*l.* (In the case of the cow being in calf, and not in milk, the Prize will not be given until she is certified to have produced a calf.) 4. To the owner of the best in-calf Heifer, not exceeding three years old, 15*l.*—5. To the owner of the best Yearling Heifer, 10*l.*—6. To the owner of the best Bull-calf, not exceeding one year old, 10*l.*

Devons.—CLASS 1. To the owner of the best Bull calved previously to the 1st of January, 1843, 30*l.*; to the owner of the second best do. do., 15*l.*—2. To the owner of the best Bull calved since the 1st of January, 1843, and more than one year old, 20*l.*—3. To the owner of the best Cow in milk or in calf, 15*l.* (In the case of the Cow being in calf, and not in milk, the Prize will not be given until she is certified to have produced a calf.)—4. To the owner of the best in-calf Heifer, not exceeding three years old, 15*l.*—5. To the owner of the best Yearling Heifer, 10*l.*—6. To the owner of the best Bull-calf, not exceeding one year old, 10*l.*

Cattle of any Breed (not qualified to compete in the foregoing classes).—CLASS 1. To the owner of the best Bull calved previously to the 1st of January, 1843, 20*l.*; to the owner of the second-best ditto, 10*l.*—2. To the owner of the best Bull calved since the 1st of January, 1843, and more than one year old, 15*l.*—3. To the owner of the best Cow in Milk or in calf, 15*l.* (In the case of the cow being in calf, and not in milk, the prize will not be given until she is certified to have produced a calf.)—4. To the owner of the best in-calf Heifer, not exceeding three years old, 10*l.*—5. To the owner of the best Yearling Heifer, 10*l.*

HORSES.

CLASS 1. To the owner of the best Stallion for Agricultural Purposes, of any age, 30*l.*; to the owner of the second-best do. do., 15*l.*—2. To the owner of the best three years old do., 15*l.*—3. To the owner of the best two years old do., 15*l.*—4. To the owner of the best Mare and Foal for Agricultural Purposes, 20*l.*; to the owner of the second-best do., 10*l.*—5. To the owner of the best two years old Filly, 10*l.*—6. To the owner of the best Thorough-bred Stallion, which shall have served mares at a price not exceeding 3 guineas (and with a groom's fee of not more than 5*s.*) in the season of 1845, 30*l.*

SHEEP.

PRIZES FOR IMPROVING THE BREED OF SHEEP.—1845.

Leicesters.—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*; to the owner of the second-best do. do., 5*l.*

South-down Sheep.—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second-best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*; to the owner of the second-best do. do., 5*l.*

Long-Woolled Sheep. (Not qualified to compete as Leicesters.)—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second-best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*; to the owner of the second-best do. do., 5*l.*

Sheep best adapted to a Mountain District.—CLASS 1. To the owner of the best Ram of any age, 15*l.*; to the owner of the second-best do., 10*l.*; to the owner of the third-best do., 5*l.*—2. To the owner of the best pen of Ewes of any age, 10*l.*; to the owner of the second-best do., 5*l.*

PIGS.

CLASS 1. To the owner of the best Boar of a large breed, 10*l.*; to the owner of the second-best do. do., 5*l.*—2. To the owner of the best Boar of a small breed, 10*l.*; to the owner of the second-best do. do., 5*l.*—3. To the owner of the best breeding Sow, of a large breed, 10*l.*—4. To the owner of the best breeding Sow, of a small breed, 10*l.*—5. To the owner of the best pen of three breeding Sow-pigs, of the same litter, above four and under ten months old, 10*l.*

AGRICULTURAL IMPLEMENTS.

A sum not exceeding 300*l.*

Cheese.—To the exhibitor of the best cwt. of Cheese (of any kind) made within the district, 10*l.* To the exhibitor of the second-best do., 5*l.*

Extra Stock, Roots, and Seeds.—For Extra Stock, of any kind, not shown for any of the above Prizes, and for Roots, Seeds, &c., Prizes may be awarded and apportioned, by the Committee and Judges, to an amount not exceeding in the whole 50*l.*

Any New Implement.—For the invention of any new Agricultural Implement, such sum as the Council may think proper to award.

Seed Wheat, Barley, and Oats.—I. Fifteen Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of white Wheat, of the harvest of 1844, and grown by himself.

II. Fifteen Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of red Wheat, of the harvest of 1844, and grown by himself.

III. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of spring Wheat, of the harvest of 1844, and grown by himself.

IV. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of Barley for malting, of the harvest of 1844, and grown by himself.

V. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of Oats, of the harvest of 1844, and grown by himself.

Competitors are requested to send with their Wheat, Barley, or Oats, specimens, fairly taken, of the same in the ear, with the whole of the straw, in a sheaf not less than one foot in diameter, and with the roots attached.

[12 bushels of the Wheat, Barley, or Oats, will be sealed up by the Director or Stewards, and one of the remaining bushels of each variety will be exhibited as a sample to the public; the other being kept for comparison with the produce of the next year. At the General Meeting in December, 1846, the Prizes will be awarded.]

The two best samples of each of these classes of Wheat, Barley, or Oats, without at that time distinguishing, in any of the cases, between the comparative merits of either sample, will be selected by the Judges appointed for the Meeting at Shrewsbury; and will be sown, under the direction of the Council (the winter Wheats in the autumn of 1845, and the spring Wheat not earlier than the 1st of March, 1846), by four farmers, who will make their report, upon which the Prizes will be awarded, provided there be sufficient merit in any of the samples. 10*l.* will be given at the Meeting at Shrewsbury to each exhibitor whose Wheat has been selected for trial, and 6*l.* for the Barley or Oats.

*** No variety which has been selected for trial at any previous Show shall be qualified to compete in the same class.

ESSAYS AND REPORTS ON VARIOUS SUBJECTS.

Prizes for 1845.—PRIZE ESSAYS.

1. *Farming of Nottinghamshire.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Nottingham. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Nottinghamshire since the Report of Mr. Robert Lowe in the year 1798; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

2. *Farming of Cornwall.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Cornwall. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Cornwall since the Report of Mr. G. B. Worgan, in the year 1811; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

3. *Farming of Kent.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Kent. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Kent since the Report of Mr. John Boys, in 1805; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

4. *Heath Land.*—Twenty sovereigns, or a piece of plate of that value, will be given for an account of the best method of reclaiming heath-land. Competitors will be required to describe methods which have been successfully adopted in the reclaiming of heath-land, reference being had especially to the following points:—1. The mode of breaking up, whether by paring and burning, or by simple ploughing. 2. The application of lime. 3. The course of cropping. 4. The conversion of heath-land into pasture, where either the steepness of the land, or its elevation above the sea, does not allow the culture of corn.

5. *One-Horse Carts.*—Ten Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on the advantages of One-horse Carts. Competitors will be required to point out the saving in horse-labour, and other advantages which undoubtedly arise from the substitution of one-horse carts for waggons.

6. *Catch-Meadows.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on Catch-Meadows. Competitors will be required to describe the best and cheapest method of forming water-meadows on the sides of natural slopes, as practised in Somersetshire and Devonshire; the mode of managing them, and of applying their produce; the increase of value thereby given to unproductive hill-sides; and to state how far this mode of improvement might be applied to the mountainous districts of Wales and of the North of England.

7. *Fences.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on Fences. Competitors will be required to describe the best and neatest methods of maintaining hedges, whether for arable or for grazing ground; and to point out how far the present fences in various parts of England are injurious to the farmer, whether by their size, their excess in number, or the over-abundance of timber which they contain.

8. *Fattening Cattle.*—Ten Sovereigns, or a Piece of Plate of that value, will be given for an account of the best method of fattening cattle; as to the places in which they are kept, large or small yards or stalls; as well as the food, roots, hay, &c. on which they are fed during the time of fatting.

9. *Tile-yards.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the cheapest and best method of establishing a Tile-yard. Competitors will be required to attend to the following points:—1. Mode of working the clay, according to its quality. 2. Machine for making the tiles. 3. Sheds for drying the tiles. 4. Construction of the kiln. 5. Cost of forming the establishment. 6. Cost of the tiles when ready for sale.

10. *Curing Butter.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best description of the Dutch method of salting butter; pointing out the causes of its superiority to other salted butters.

11. *Experiment in Agriculture.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for an account of the best Experiment in Agriculture.

These Essays must be sent to the Secretary, at 12, Hanover-square, London, on or before March 1st, 1845.

Rules of Competition for Prize Essays.—1. All information contained in Prize Essays shall be founded on experience or observation, and not on simple reference to books, or other sources. 2. Drawings, specimens, or models drawn or constructed to a stated scale, shall accompany writings requiring them. 3. All competitors shall inclose their names and addresses in a cover, on which only their motto, and the subject of their Essay, and the number of that subject in the Prize List of the Society, shall be written. 4. The President or Chairman of the Council for the time being, shall open the cover on which the motto designating the Essay to which the Prize has been awarded is written, and shall declare the name of the author. 5. The Chairman of the Journal Committee shall alone be empowered to open the motto-paper of such Essays, not obtaining the Prize, as he may think likely to be useful for the Society's object, with a view of consulting the writer confidentially as to his willingness to place such paper at the disposal of the Journal Committee. 6. The copyright of all Essays gaining prizes, shall belong to the Society, who shall accordingly have the power to publish the whole or any part of such Essays; and the other Essays will be returned on the application of the writers; but the Society do not make themselves responsible for their loss. 7. The Society are not bound to award a prize unless they consider one of the Essays deserving of it. 8. In all reports of experiments the expenses shall be accurately detailed. 9. The imperial weights and measures only are those by which calculations are to be made. 10. No prize shall be given for any Essay which has been already in print. 11. Prizes may be taken in money or plate, at the option of the successful candidate. 12. All Essays must be addressed to the Secretary, at the house of the Society.

(By Order of the Council) JAMES HUDSON, Secretary.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

RARE ORCHIDACEÆ FROM THE EAST INDIES.

MESSRS. J. C. AND S. STEVENS, beg to announce they will sell by Auction, at their Great Room, 38, King-st., Covent Garden, on Thursday 15th August, at 1 o'clock, a Case of Terrestrial and Aerial Orchidaceæ, which have just arrived in fine health, and gathered during the months of January and February last, on the Steeps of the Ghass, in the Presidency of Bombay. On view two days prior to the Sale; and Catalogues had of the Auctioneers, 38, King-street, Covent Garden.

BEDFORDSHIRE.—Very Eligible Freehold Estates in the parish of Sandy, cultivated as Garden Ground, and offering to Trustees safe and profitable Landed Investments, not to be influenced by any change in the Corn-laws. Also a Freehold Family Residence, and other property, at Caldecote. The whole Tithe free and Land Tax redeemed.

MESSRS. RUSHWORTH AND JARVIS are instructed by the Mortgagees, with the concurrence of the Devisees in Trust under the will, to sell by Auction, at Garraway's, London, on Friday, Aug. 23d, at 12 o'clock, in 15 Lots, (unless previously disposed of by private contract), a very desirable Freehold Property, comprising 170 acres of land, with two Farm Homesteads; situate at Beeston, in the parish of Sandy; a district proverbial for the remarkable richness and fertility of the soil, and highly valuable as garden ground; a portion of which was late in the occupation of the deceased, and the remainder is let on long leases to responsible tenants, at almost incredibly high rents; and substantial additional advantages to the property may be looked for from the newly-projected Line of Railway, direct from London to York, which is contemplated will pass over this estate. There are likewise several Cottages, a Wheelwright's shop, and Beer-house, at Beeston Green. Also a spacious Family Residence, with possession, in a fine sporting country, and having extensive stabling and out-buildings, a Licensed Ale-house, eleven Cottages near thereto, and 1 acres of luxuriant garden ground adjoining, situate at Caldecote, only one and a-half mile distant from the preceding property, and equidistant with the capital Market Town of Bedford, and only 47 miles from London on the great north road.—Printed particulars, with plans, may be obtained on the premises at Caldecote, at the principal Inns in the neighbouring towns, and in London, of Messrs. Barker, Rose, and Norton, Solicitors, 50, Mark-lane; Messrs. Gregory, Faulkner, Gregory and Bourdillon, Solicitors, 1, Bedford-row; at Garraway's; and at the Offices of Messrs. Rushworth and Jarvis, Land Surveyors and Auctioneers, Saville-row, Regent-street, and 19, Change Alley, Cornhill.

SOUTHAMPTON.—SMALL CONSERVATORY FOR SALE

TO BE SOLD, a most complete and modern Greenhouse, with span roof and bow front; 18 feet by 12 feet, with two stages, furnace, &c., and with or without a choice Collection of Plants; the whole the property of a Lady, who is removing.—For particulars apply to WITHER and ROBERTS, Auctioneers, &c., Above Bar, Southampton.

FARMS TO LET.—240 ACRES.

TO LET ON LEASE, a FARM in the County of Wilts, near Bath, of 110 acres—40 Meadow and 70 Arable - in a high state of cultivation, and Crops; with most complete and extensive Farm Buildings, adapted for profitable Scientific Farming, which may be entered upon immediately, and crops taken at a valuation, or at Michaelmas. In addition to which, another FARM adjoining, of 130 acres, principally Arable, will be added, on the lease expiring next year. Well situated for great Markets, and Turnpike-roads and Canals running through or close by them. The Tenant must prove his having a sufficient capital. Direct to Mr. EVANS, Estate Agent, &c., 46, Milsom-st., Bath, or (Thursdays) No, 2, Bridge-st., Bristol.

NEW AND RARE PLANTS.

W. J. EPPS begs respectfully to offer the following new and valuable Plants:—

Achimenes picta, 10s. 6d. to 15s.
,, hirsuta strong plants, 2s. 6d.
Buddlea Lindleyana, 10s. 6d., strong stocky plants, 31s. 6d. (new and splendid variety, from China, flowers of a beautiful blue)
Thunbergia chrysops
Drymonia punctata, 10s. 6d. (for description see Paxton's Magazine for June)
Habrothamnus fasciculatis, 5s.
Brugmansia parviflora, 5s.
,, Knightii, 5s.
Pentas carnea, 5s.
Clerodendron lævifolium, 7s. 6d.
Gloxinia Cartemi, 10s. 6d.
,, bicolor, 7s 6d.
,, magnifiora, 7s. 6d.
,, insignis, 7s. 6d. (these are the finest varieties known)
Begonia coccinea, 2s. 6d.
Rose, Cloth of Gold, 7s. 6d.
Fuchsia, Kentish Bride, blue corolla, pink tube and sepals, decidedly the finest variety sent out this year, strong plants, 3s. 6d.

Orders to be accompanied with a remittance or a respectable reference.—Bower Nursery, Maidstone, Aug. 1, 1844.

The Gardeners' Chronicle.

SATURDAY, AUGUST 3, 1844.

MEETING FOR THE FOLLOWING WEEK.

TUESDAY, Aug. 6 Horticultural . . . . 3 P.M.

COUNTRY SHOW.

TUESDAY, Aug. 6 . . Coppice Carnation and Picotee Show.

As MUSICAL PROMENADES are not matters of horticultural interest, even although they are held in a garden, we think it unnecessary to say much of that which the noble President and the Council of the Horticultural Society so liberally provided last Wednesday for the disappointed holders of Exhibition tickets. It is sufficient to state that the effect of the admirable music was quite delightful—that the scene was very gay, the visitors highly gratified, and the meeting in all respects a very pleasant one, notwithstanding a shower or two and threatening clouds. The number present was 2267.

"I HAVE a fine MULBERRY-TREE," says an inquirer, "upwards of 200 years old, and perhaps 18 feet high, of which I am extremely proud; but on account of some alterations I am going to make in my grounds this autumn, its roots will be buried 5 or 6 feet below the surface, if the tree is allowed to remain as it is; and I wish to know what is best to be done under the circumstances—whether to allow the roots to be so buried, or, if I shall be obliged to raise them, how, and at what time it will be best to do so." As this is a question the answer to which will doubtless interest other persons besides our correspondent, it seems to deserve a more prominent place than is usually given to such communications.

We know, from experience, that many people, otherwise well-informed, believe that roots may be buried to any depth without injury, and are surprised to find, when they act upon that belief, that their plants either perish or grow sickly. Do not we see, say they, that the roots of trees descend of themselves to great depths below the surface; and if so, why should we not also bury them to such depths? And it must be admitted, that if the premises in this case were true, the inference would be true also. But, with great deference to popular opinion, we are obliged to say, that roots never reach far below the surface of the soil, and when they do, it is owing to particular circumstances. Some years since, an acquaintance produced a Lucerne-root, 18 feet long, in proof of the common belief; but a little investigation showed that root to have been formed in the side of a gravel-pit, along the steep face of which it had pursued its course, without ever being above 6 inches from the surface.

The truth is, that roots must have access to atmospheric air, for chemical reasons into which we shall not enter just now; and the exclusion of it from roots, which necessarily happens when large masses of earth are heaped upon them, is as fatal as suffocation would be to ourselves. Under natural circumstances the tendency of the roots to keep near the surface is invincible; and this should of itself teach us how important to them is free access to air.

"The celebrated Duhamel," says Col. Greenwood, "wishing to protect his field from robbery from the roots of a row of Elms, cut a deep ditch between the Elms and his field. The roots, however, were not to be done. They of course followed the surface of the ground, whether down, horizontal, or up hill, and took the ditch 'in and out clever' into the philosopher's field. Duhamel thinks these were very cunning roots, and that they had an instinctive notion of the treat they were to have on the other side of the ditch, and grew *at* it. Had the philosopher built a wall in the ditch, and then filled it in, he would have beaten the roots, on account of their inability to leave the surface and get under the wall."

Nothing can be more just than this observation, and it puts in the truest light the question as to whether roots may be buried or not.

Nevertheless, although roots cannot be buried to any considerable depth without danger, yet it is possible to pile masses of earth round trees with impunity. The absorbing parts of a tree's root are its extremities, and provided they are in free communication with air, it matters little what becomes of the other part. Let us suppose that the figure *a b c d* represents a tree, of which *a b* is the height, and *c d* the spread of the branches. Then the spread of the roots would probably be equal to *e f* (a point that would have to be ascertained by examination), and if so, there would be no disadvantage in heaping up soil as high as *i*, over *g a* and *a h*, because *e g* and *h f*, where the extremities of the roots are found, would still be as freely exposed to air as before the operation.

Nor is it clear to us that earth might not be heaped over the roots of a tree to any required depth, provided air-passages were left among the roots. Let

us suppose, for instance, that *a b* represents the stem of a tree, and *c d* the spread of its roots, while *e f* shows the mass of earth placed over them. It is probable that if the shafts *g h* and *m l* were connected with the drains *h i* and *k l*, and there were several of them round the tree—say 6 or 8—it is probable that under those circumstances the tree would not suffer much or long; it would, however, be an experiment for the success of which we would not answer.

As to removing a Mulberry-tree 18 feet high and 200 years old, it is not to be thought of without considerable mutilation. If it is absolutely necessary to transplant the tree, the course which we should follow would be this:—We should get up its roots, to the extremities of the fibres, with what care we could; we should then cut off all the young wood, so as to render impossible any sudden drain upon the roots when the season for leafing returns; and we should, when transplanting it, throw a quantity of superphosphate of lime into the hole where the young roots are, so that they might be in contact with it. We should perform the operation as soon as the leaves had fallen, which would be after the first frost; and then, securing the trunk firmly in its place, we should leave the rest to Nature, with reasonable confidence in the success of the experiment.

IT is not very long since an ingenious person undertook to prove, from historical evidence, that no such person as Napoleon Bonaparte ever existed. A writer in the *Hereford Times* is determined to rival the historical critic, for he asserts that the POTATO was not originally brought to Europe from America, as we are simple enough to believe. On the contrary, "It would seem to be probable that the Potato was known as much as three hundred years before the Christian era, having been accurately described as the *αραχιδνα*." What a pity it is that gentlemen will not write about what they understand! A very little inquiry would have informed the correspondent of the *Hereford Times* that this Arachidna of Theophrastus was a Lathyrus, and in all probability either L. tuberosus or L. amphicarpos.

NOTES ON THE CONIFERÆ OF JAPAN.

So much interest is now taken in forming Pineta and in collecting Coniferous plants, that I have thought the following remarks on the kinds found in Japan, and lately described by Drs. Siebold and Zuccarini in the "Flora Japonica," may be of use to those interested in such matters, and also in directing those who may at some future time have an opportunity of visiting Japan, and procuring either plants or seeds of those kinds which yet remain to be introduced into England; and this is more particularly desirable, on account of their being quite hardy.

Abies leptolepis of Siebold. "Flora Jap.," Tab. 105, p. 12.—This is a very distinct dwarf kind of Larch, and is the same as Larix sibirica of Drs. Ledebour and Bunge, but is a very distinct species from that found in most English and foreign collections under that name. It is very dwarf, probably never growing more than 3 or 4 feet high; and forms a dense bush, with the leaves and cones as small as those of the American Larch. Dr. Bunge was the first who sent seeds to the Horticultural Society in a living state. The Siberian Larch described by Mr. Loudon in his last edition of the "Arboretum Britannicum," p. 1054, is a very distinct kind from that of Dr. Bunge, and is, as is there stated, only the Russian variety of the common Larch, with the branches more robust, but much less numerous. It is to be found in most collections under either of the following names—Larix sibirica, L. archangelica, or L. Rossica. The Abies sibirica of Dr. Fischer is a very different species from either of the above, and is the same as Abies pichta of the "Arboretum Britannicum," and belongs to the Silver Fir section. The authors of the "Flora Japonica," in describing this curious little plant, which always comes true from seed, should have adopted the name of Larix for that of Abies, as is now generally done; then, as Dr. Bunge's name (L. sibirica) had been previously applied to the Russian Larch, the present plant would stand as Larix leptolepis.

Abies tsuga of Siebold. "Flora Jap.," Tab. 106, p. 14.—This is the same as Abies dumosa of Lambert, Abies Brunoniana, Lindl., and Abies subdecidua, Wallich; and noticed by me in a former article in the *Chronicle*. It belongs to the same section as the Hemlock Spruce, which it very much resembles, and, like that species, only forms a large bush, or small tree, from 20 to 30 feet high. It still remains to be introduced, and would prove, no doubt, quite hardy.

Abies firma of Siebold. "Flora Jap." Tab. 107, p. 15.—This belongs to the Picea, or Silver Fir section, and greatly resembles in foliage and habit Abies pichta (Abies sibirica of Ledebour), but differs very much in the cones; the cones of Abies firma having the bracts considerably longer than the scales, while those of A. pichta are not so long as the scales; in fact, the cones more resemble those of the Picea pectinata, or P. cephalonica, than any other, but are not near so large. In the drawing given in the "Flora Japonica" the cones are represented as pendulous, but that is evidently a mistake. It is said to be a tall tree, and, no doubt, quite hardy; and probably only a northern form of the Picea pectinata, which still remains to be introduced.

Abies homolepis. "Flora Jap." Tab. 108, p. 17.—This very much resembles Abies Smithiana, of Dr. Wallich, both in cones and branches, and most probably is identical. The scales figured quite agree with those of Dr. Wallich's A. Smithiana, in the uneven margin and smaller size. This is very different from Dr. Royle's A. morinda, or Khutrow, a much taller and more robust tree. It is said to be a tree from 20 to 30 feet high, and belongs to the Spruce section; it remains to be introduced.

Abies bifida of Siebold. "Flora Jap." Tab. 109, p. 18.—This is the same as Picea Webbiana of the "Arboretum Britannicum," p. 1051, and is the P. spectabilis of Lambert, and Chilrow of the natives in the Himalayas. It belongs to the Silver Fir section, and is one of the most ornamental of the whole race of Pines, having beautiful large purple cones and silvery leaves. It forms a large tree in the Alps of Gossamthan, from 80 to 100 feet high, and is easily distinguished from all others yet known (except P. pindrow, of Royle), by its bifid leaves, and from that species in its much broader and shorter foliage. It is quite hardy, but is much injured in spring by late frosts.—*George Gordon.*

THE ROSE-GARDEN.—No. XV.

(*Continued from p.* 460.)

Pruning for Transplanting.—Having gone through all the detail necessary to secure the budded trees, and bring them into bearing, (observing that they are not on any account to be mangled, shortened, or the passage of the sap in any way obstructed during growth,) we now come to the time when the tree, having become ornamental, is fit to repay the labour laid out upon it, and to be planted out where its beauty may be seen. This is about the commencement of November, when the branches should all be cut down to about a foot long, and any leaves still left, cut off carefully midstalk, with a pair of scissors. Worked standards, carelessly treated, frequently do well the first season after transplantation; and then, dwindling away for a season or two, eventually die off.

Except where unavoidable, (as in the instance of the wild stock,) a tree should not be lopped root and branch at the same time; the double mutilation is injurious to it. Thus, half of each branch is continued, to keep up an intercourse with the root, and, when an action is established, cutting in the head is desirable. On removing trees, the fresh roots they have made, and the appearance of those which were left, will require attention in the application of the knife; in pruning a large root it should be cut to a lateral—in shortening a small to a fibre; where a plant has been examined and trimmed so recently, however, the knife should be sparingly used. And it may here be well to observe, that all cuts to remove branches, knots, or roots, should be quite clean, slanting (and deep enough to the stem, viz. even with it), and nothing left projecting, lest dead wood be the consequence, and the plant be eventually injured; all wounds should be carefully healed, and dead wood should, in all cases, be removed, and living bark encircle that which remains. The removal of the extraneous parts of the wild branch, and the stem left above it (if any), as subsequently directed, are best effected 18 months after budding, in March; if sooner, the bud is apt to be injured, as well as the wound left uncovered; but at this time they may be cut down to the base of bud and branch, and the mixture will secure the wound from injury. All summer and spring-made wounds, if clean cut, will partly cicatrize over the same year, and, if defended while in progress, will not do any future injury.

Replanting with a Dormant Bud.—In case of necessity a stock with a dormant bud upon it, of the summer's insertion, may be transplanted; but this is not desirable, although, if the wild branches to be cut off are large, it may be safely enough done, because a tree in its natural state, if the root and branches are in proportion to each other, has strength enough to carry its nourishment through the old wood, and then to make new. Old wood does not remain *in statu quo*, but is enlarged by a fresh

layer each year, between the bark and wood, to enable it to bear the additional weight it has to support, as well as to enlarge the channels for the conveyance of sap to an increased head. Both these causes act upon trees which have their own entire weight to support, and therefore they are conically shaped; only the last applies to creepers and climbers, and therefore they can but barely be called so, being nearly of a size all the way up. On this showing, therefore, if the old wood be cut away, the injury done to the root in moving, is made up by the non-necessity of keeping up the old wood; and thus great part of the labour of the sap being saved, and its duty diminished, as well as a free course given to it, the buds succeed. This, it is apprehended, is the theory upon which all pruning for transplantation is founded. But, to explain this more fully:—Amongst trees, there are some of which the bark is so strong that the sap is confined in its ascent, and the tree becoming hidebound, is unable to increase, unless a slit be made from the top of the tree to the bottom, in order to give the sap full liberty to ascend. Those whose barks have become hardened and dry, may sometimes be seen to throw out buds all the way up the body of the branch, each bud being weaker than the lower one, the point of the branch dying away. This tendency of the sap to desert its former channels, may be observed in newly-planted thorns, particularly whenever they have not been cut back enough. Now, a transplanted tree frequently makes but little wood the first year, and consequently few leaves; and the intercourse between the roots and stem being thus, as it were, partially suspended, the bark becomes hard, and the next year the sap has a great difficulty in ascending. Where a check occurs in vegetation, a sufficient quantity of sap to start the leaves creeps up and accumulates by gradual steps; but when the warm weather comes on, and the shoots are expected to flourish, they are found to have no support from the root, and they go off accordingly. Shoots called Gourmands, on the contrary, and suckers, being soft and free, arrive to an astonishing size: witness the shoot of a Vine, which is frequently larger in the girt than the stem it proceeds from. A tree lately moved and planted with more branches than its roots can nourish, may be considered like a man in debt; the little it can do is absorbed by the demands upon it, and it is just able to keep up what it has. The next year sees it in the same state of weakness, with a hard bark, and the whole substance confined; it has a more difficult duty and unincreased means. Or if it has not sap sufficient to keep up its present head, its parts die off as the supply diminishes, and the tree grows weaker and weaker; and having exhausted all its supply, without an efficient return from the leaves, which are unhealthy, it dies off and perishes by degrees. On the contrary, a tree newly planted may be likened to a person who is promised that no demand shall be made upon him until he is enabled to answer it, when it is placed in the ground with no open buds upon it, and only enough closed ones to carry on the duty required when they are forced open, which will be sooner or later, according to the individual strength of the tree. The sap accumulates, the buds start at their proper time, and when started, the tree, weakened by its removal, has no length of half-dried wood to force the sap through, but the new buds throw out soft and large bases, the sap courses through them establish a give-and-take intercourse with the root at once; they require no more of the root than it can perform, and they are ready to repay with interest; and as a free passage for the fluids is as much the cause of health and vigour in the vegetable as the animal creation, the tree flourishes and succeeds. Thus, time to recover, and liberty in its work, are two great desideratums in removing a tree; and if these are attended to, a newly-budded stock may be removed, even from a hedge, with barely any root, into good ground, with perfect success, by the circumstance of the bud being placed, as in this instance it would be, below the head, when the sap would have only half its original height to ascend; and as the weight of a hundred cubic feet of water would cause a fountain placed below it to rise to a certain height, and the same fountain, with only fifty feet of water above it, would play equally well, if it were only required to rise to a height proportioned to the decrease of force acting upon it: so a tree budded and cut as below would succeed, from the same cause.

Home Correspondence.

Melons, to fertilise.—Among some experiments which I have lately witnessed is one which, if not new, is interesting. Mr. Aitkin, gardener at Pitfour, in Fifeshire, is in the practice of treading the soil firm into the frames where he grows Melons; and he does not water the plants until the fruit attains a large size. The plants are allowed to grow until they nearly fill the frame, when they are pruned back until they show fruit-blossoms on the lateral branches. The strongest flowers are selected, and fertilised in the usual manner, the male flower or anther being left in the female blossom. The corolla is then gathered together by the one hand, while the other immediately draws the dry mould over it. The fruit remains covered until it attains the size of an Orange, when it is placed upon slates in the usual way. Mr. Aitkin uncovered a number of fruit in my presence, none of which were injured by damp; indeed, his Melons in their various stages are well grown. They are nearly white when first exposed to light, but very soon become of a bright green. Whether this system of growing the Melon may turn out of utility or not, it may at all events increase the facility for keeping varieties true; and although the soil may be too moist with many growers, perhaps it may suit equally well to cover them with dry sand, &c. on the slates where they are commonly set. Mr. Aitkin considers the extra temperature of the soil advantageous in the diffusion of the pollen. May this not suggest experiments regarding fertilising many kinds of flowers in dark warm cases, &c. while the leaves grow in the light?—*R. Arthur, Waterloo-place, Edinburgh.*

Bees.—It has been a matter of dispute among apiarians whether it is advisable or not to co-operate with the working bees by assisting them in their warfare at this season against the drones. Some have contended that it is not; and, certainly, in the manner in which it has been usually attempted, it had better be avoided. But in the method I am about to detail, I put at rest the question as to any injury to be sustained by a family of bees, from the sudden abstraction from it of all the drones it had contained. Those who have paid attention to the habits of these, when an attack has commenced on them by the watchers, must have observed a disposition to congregate together, as if for mutual protection, in a distant part of the hive. It occurred to me that this tendency to separation might be turned to account advantageously, if the suitable means were provided. The hive on which my experiment was tried was a collateral one, viz., a centre and two side-boxes. The centre and one side-box were occupied by the bees, and pretty well filled; the other side-box was empty, the bees not having access to it. I resolved on making this a place of refuge for the drones, if they chose; and, accordingly, on the morning of the 14th June, when the work of proscription had evidently commenced, I opened a passage throughout nearly the whole length of the bottom edge of the empty box, about half an inch high, but leaving all the upper openings closed. On looking into the windows of the side-box at night, I found my expectations completely verified, for the drones, to avoid persecution, had availed themselves of this asylum, and were clustered together in a compact body, like a new swarm, at the top of the side-box; and in no part of the other two boxes could I discover one. What effect the pangs of hunger might subsequently have had upon them I know not; but during the time they had thus voluntarily expatriated themselves, the drones showed no disposition to return to the parent hive, but continued to hang motionless, as I have described. In this state I left them till the following morning, when I shut off the communication between the boxes, and removed the one containing the drones. These I speedily suffocated, with the exception of about 200 that escaped. I had sometimes imagined that the number of drones in a hive at this season is larger than common computation makes it, and this was a point I wished to determine. The dead drones were carefully counted, and amounted to rather more than 2200 in number, besides those that had escaped, and doubtless many more had previously fallen victims to the working bees; of the latter not a single one was found amongst the drones. On the same day all commotion had ceased in the hive, and the bees went with unusual alacrity to work, and did well. The first drones I had observed in the stock of bees subjected to the operation, were on the 23d of May, and after their destruction I saw not a single one until the 23d of July, when a second hatching of drones commenced; but the greater part of the grubs were ejected from the hive in that state. It is needless, perhaps, to say, that so complete and sudden an abstraction of the drones, entirely refutes the notion entertained by some theorists, that their presence is essential to the fecundation of the eggs, previously laid by the Queen; but it seems also to prove that they are as little required in the hive for the generation of the necessary degree of heat in the hatching season, as has been surmised; or why is it that in a hive subjected to the cooling process of ventilation, (and the hive I have herein referred to was one of these,) the destruction of the drones usually takes place earlier than in one left in its natural state of warmth?—*H. Taylor, London.*

Preserves, to Cork.—In the receipt for preserving Currants, resin is recommended for the corks, but the brown cement, Parker's or Roman, answers much better and breaks off when wanted without any trouble. Mix it thinner than for cement, and put some over the nose of the bottles: it soon sets. The writer has used it for years.—*N. O. P.*

Large Gooseberry.—On the 29th of July, Mr. T. Gibson, of Nottingham, found a Loudon Gooseberry, grown in his garden, of the weight of 35 dwts. 12 grains. —*J. F. W.*

Asparagus.—I can, from long experience, confirm all you recommend as to the application of salt to Asparagus beds; and I cannot comprehend the objection to this saline manure; it must either result from ignorance, or from the use of the salt at an improper season. Perhaps those gentlemen who write against it, applied it whilst the roots were in a dormant state; if so, I do not wonder at the destruction of their Asparagus plants. Let them try it just as the roots begin to move in the spring, and let the application be renewed two or three times during the growing season, and let them always select a wet day for the work, and I will vouch for it they will soon become converts to the use of salt in a proper season; but other manure must not be forgotten. I have quite renovated an old bed by an abundant use of salt. For many years I have known sea-weed, and strong sea-sand, taken wet from the receding tide, used as a dressing for Asparagus beds, and I never knew those beds to fail. Now the secret of this application is in the saline qualities of the weed and of the sand, and not in any substantial quality of the sea-weed, for when this is dissolved there is nothing left for the earth of the beds to feed upon. An attentive observer of the natural history of the Asparagus plant cannot fail to discern the propriety of using saline manures in its growth; and the same treatment as to sea-weed and sea-sand applies to sea-kale. Both these plants are indigenous in Cornwall, and there is an island near the Lizard Point, called Asparagus Island, on which that plant grows, and where I have frequently gathered it. In heavy gales of wind the sea breaks over the part of this island on which the Asparagus grows. The soil is sand, and loose decomposed vegetable substances.—*Cornubiensis.*

Acclimatising Plants.—In reply to Mr. M'Intosh, who lately desired some one to give the results of their experiments on the above subject, I would mention that I have for several years preserved many of the different kinds of Fuchsias in the open garden, in all situations, during the winter, by simply cutting them down when they have done flowering, covering them over with a spadeful of gravel and a small slate, or flag. The slate, or flag, I find useful in preventing the heavy rains in winter washing away the ground, and, consequently, starving the plants, as in this part of the country we have generally very wet winters. Last year having too very tall Fuchsias (Globosa), above five feet high, I did not cut them down, but took them up, potted them, and placed them in a room without fire, near to a window facing the north; gave them very little water, and treated them according to my notions judiciously; but to my surprise, I found in the spring that the main stem was dead; a proof that I might as well have saved myself the trouble I had been at, by cutting them down in the open ground, as above mentioned.—*Chemical Jack.*

Humphreys's Soluble Compound.—If Mr. Humphreys has professed to sell a compound whose utility depends on constituents which it does not really possess, the exposure which he has received in your *Chronicle* is no more than he deserves: but if your remarks were intended to convey the impression that in consequence of the absence of phosphoric acid, his Compound was of no value, I am bound in fairness to say that I have made some experiments with it, which show that it does possess fertilising powers of a very powerful character. They may arise from the nitrate of ammonia, and he may charge an extravagant price for his mode of making up that material: I am not able to speak on those points. But I can say that on the 22d June, I applied the Compound in the proportion recommended on the label, to a Petunia, Verbena, Fuchsia, Pelargonium, Campanula, Pultenæa stricta, and though only one application has been made, the invigorating effects are most visible. The leaves are larger, and of a deeper green than other specimens exhibit which stood by their side, and were similar in every respect, as far as I could perceive, before I made the experiment. Yellow leaves on the Pelargonium in more than one instance were turned into a fine deep green.—*C. I. D.* [Our correspondent will see that we have never said one syllable against Humphreys's Compound as a manure: our observations have been strictly confined to the question, whether it contains phosphoric acid or not? Nitrate of ammonia is a substance extremely rich in nitrogen, and well known to be valuable if judiciously applied.]

Colours.—In Notices to Correspondents lately, you ask some one to answer "N. O. P.," who wants to know why colours made by man are different by candlelight from daylight, whilst in those of Nature, hardly any difference is perceptible? I beg to answer him by denying the latter part of his position. I took a candle into my greenhouse for the purpose of testing the fact, and found that Verbena Hendersonii, which is a beautiful purple, appeared of a decided crimson. Sollya heterophylla, and angustifolia, which are of a light and dark-blue, appeared of a pale and deeper-lilac. The corolla of Fuchsia formosa elegans, and globosa, which is a deep violet, appeared to be a dull dark maroon; and finally, the yellow decaying leaves of a Tropæolum pentaphyllum were of a fine deep green.—*C. I. D.*

Planting Pines in Tan.—Acting under the advice given in Mr. Hamilton's treatise on the Pine Apple, I planted out, a few days after his work appeared, 24 fruiting plants in tan, or rather tan and decomposed leaves, under the expectation that they would produce me some tolerable fruit; but to my great disappointment the experiment is a complete failure; and on examination I find the plants have not made a single root into the tan, and even where young roots were formed, they have died off. Now, these plants have neither been too hot, too wet, nor too dry, the bottom heat having been about 80°, which is regulated by a tank, and the material they were planted in was just what Mr. H. would have selected himself, being tan and leaves that had been at work about six weeks, and just in a decomposing state, mixed with about one fourth of new tan, just to give life to the mass. Six lights of strong succession plants were planted out at the same time, eighteen plants in tan, and the remaining eighteen plants in soil; the plants in tan turned yellow in a fortnight, and have made a poor sickly growth, while those in soil have grown in great luxuriance, and will shortly show fruit; and finally, six other lights planted out with suckers on the old stools in November last, in fresh loam over a tank, are growing as well as could be

desired, and will make magnificent plants by the autumn. Now, with these facts and experiments before me, I think I am justified in cautioning the readers of the *Gardeners' Chronicle* against planting in tan, for though I have no doubt of Mr. Hamilton's success, or sincerity in recommending it, yet as it differs materially in quality in different localities, and as it is considered of no fertilising power, I am sure it will be better to plant out in soil, than to run the risk of failure with tan. It is but justice to say, the plants which the experiments were made with were not clean, and were subjected to ammoniacal vapour, produced by pouring gas-water in the tank for ten days, which destroyed the points of the leaves, but did not kill the scale. Had all the plants been in tan, I should have attributed the failure to the use of ammonia, but as those planted in soil grew rapidly afterwards, I should not be justified in doing so. Such is the result of my experiments; and although I do not think a bit the less of Mr. Hamilton's book for the failure, being convinced his practice is good, yet I think it best that these facts should be recorded.—*Judex.*

Pine-apples.—Having called upon many gentlemen's gardeners during the last nine months, the general conversation turned upon the culture of the Pine-apple; and they, finding that I was an intimate acquaintance of Mr. Hamilton, of Thornfield, inquired particularly about his mode of cultivating the Pine; but I am sorry to say, that most of them appear stiff-necked and stubborn—hard of belief. They could not, or would not believe it possible to fruit the Pine from the sucker still remaining upon the old stool; and when I stated that it certainly is possible, and that annually, whereby no succession-house was required, they some of them broke out into a rage, saying—"Do you consider us all fools, and are we to abandon the practice that we have followed all our time, and our fathers before us?" This was very mortifying to me, having known Mr. Hamilton for these 11 years, 5 of which I was a near neighbour. Although these last six we have been separated, I am well aware of his method of cultivation, following the same practice myself when I have the opportunity; and I can assert, that when we were near neighbours, we were not excelled in the neighbourhood of Manchester; and I can safely add, that Mr. H. ably maintains his ground. I dare venture to predict that the gentlemen of Manchester will not be satisfied till their tables are supplied with as noble Pines as Mr. Phillips's. About a month back I called upon Mr. Hamilton, who immediately called my attention to a stock of Pines, saying—"You see I have improved in my practice since you were here last"—it being then six years since I saw him; and, taking me to a pit of plants—one-half of which were in pots, the other half turned out of the pots, and planted in the tan, he said, "Do you perceive any difference in this pit of plants?" Yes, I replied; this half (pointing to those that were planted out) are a year older than the other. His answer was—"No; they are all of the same age; and these were planted out the first week in March last." We then went into the fruiting-pit, and some noble fruit there was. Mr. H. then said—"Do you recollect how heavy was the largest Montserrat that you saw here?" Yes, I said; it was 5¼ lbs. "Well," he replied, "that was the heaviest that I ever grew whilst I kept them in pots; but since I have turned them out, I have grown the same sort to 7 lbs." I have no doubt that there are some of the present "shows" that will attain that weight; and be it remembered that these are all suckers upon the old stools, some of them being the third and fourth annual crop. Should any of my brethren of the spade doubt this, if they will take a trip to Thornfield, Mr. H. will have much pleasure in showing them the proofs upon the premises, and convince them of the facts; and surely facts are stubborn things.—*John Hayward, Sumnerhill, near Newport, Salop, July* 29.

A Habit of the Common Wasp.—I felt puzzled to find reason why female wasps frequent the common Laurel arly in spring. I had observed the fact so repeatedly hat I determined to watch them; and then perceived eir object was to obtain the nectareous juice secreted by e three or four glands seated on either side the midrib d near its base, on the under surface of the leaf. As presume the wasps of other parts of England have the me habits as those which are born in this neighbourood, the above observation may be serviceable to wasp stroyers. They have only to watch the Laurels in ring when the females are thus attacking them, and ey may prevent the formation of as many nests as they ll destroy females at that season. A hoop gauze net, ch as entomologists use, will readily serve for their oture.—*J. S. Henslow, Hitcham.*

Peas.—The notice of the comparative earliness of some the new Peas, published in the *Chronicle* last year, ms to have induced rather numerous trials of the sorts hen named, and the result has been in some cases in our of, and in others against the Early May, under ich name, however, it is now evident that more than variety is known. The Pea I have called Early May known by that designation, and also as Clutton's rly, in this part of the country, and is identical with rmack's Prince Albert; at any rate, I cannot perceive real difference between them. I have been told ly that it was first brought into this neighbourhood m some part of Sussex, where it is called by some er name. In order further to test the earliness of Pea, as compared with Farnes's First Early, I sowed h sorts side by side on the 14th of February, and ir after-treatment was precisely alike; the Early May fit for use on the 24th of May, the other not till the h, thus giving nearly a week in favour of the former. It should be known, however, that Farnes's Pea is the most productive, and is a very desirable sort to succeed the Early May. Another sowing on the 16th of March gave the same result. Shilling's Early Grotto is still later by a week or ten days. I take this opportunity to recommend the Scimetar as a more productive variety than the well-known Green Imperial. The Auvergne is also an excellent bearer, each pod containing from seven to nine peas.—*J. B. Whiting.*

Whitney's Composition.—Have you had any complaints of Whitney's Composition rendering the calico tender? I covered half a greenhouse with Whitneyed calico, and the other half with the mixture recommended by "Devoniensis;" the latter is not quite so transparent, but the calico (which is a very good one, for which I gave 6*d.* a yard) is quite sound and strong, whilst the former is as tender as cap-paper.—*W. Wilkinson Platt.*

The Polmaise Heating.—The system of heating described by Mr. Murray in last week's *Chronicle*, appears to me as objectionable as the old flue mode of accomplishing this, without its advantages, and scarcely reconcileable with our present knowledge of the subject, at least if I rightly comprehend his plan. It appears to me objectionable to place the heated air at the back of the house; our common notions on this are to place the flue or chamber as near the front as possible; that would be fully recognising the principle which Mr. M. lays down as the basis on which his system is founded, as the coldest air is at the front of the house; but how this air is set in motion does not appear intelligible by the plan. The second objection which strikes me as fatal to his system, is that of "admitting fresh air from without, keeping up a healthy atmosphere," as indicated in the plan at C, C. Now, how does the air become unhealthy? Why, by the noxious gases which escape from the stove, as there can be no other means of contaminating it. Air is the same in all cases, unless it is rendered unwholesome by the decomposition of some material, such as tan or dung, or the noxious impurities generated by flues. If hot water was used in the same house, it would be quite unnecessary to think of admitting air from without.—*R. Glendinning.*—[We are informed by a gentleman who has seen this house, that nothing can exceed the health of the Vines.]

Local Horticultural Societies. — A Horticultural Society was formed at Torquay last summer, under the title of the "Torbay Horticultural Society," and held its fourth Exhibition on the 19th of July, 1844, when Mr. L., a jobbing gardener of Dartmouth, became a subscriber, and gained an extra prize for Martynia fragrans, which I consider very unfair. In the regulation for the Exhibitions, the fifth rule says—"No article shall be exhibited for a prize unless *bonâ fide* the property of the exhibitor, for two months before the days of exhibition." The plant in question was not the property of the exhibitor, but the property of one of his many employers. Is it right, or is it fair, for a jobbing gardener to exhibit in the same class with gentlemen's gardeners? If the Secretary tolerates such things as these, the Torbay Horticultural Society will soon share the fate of the Dover, Faversham, and Eltham Societies; namely, start up to-day, flourish to-morrow, languish, and then disappear. If this practice is not checked in time, the Society will die in its infancy. If the Society wishes to offer prizes for jobbing and for market gardeners, why not have a class for themselves in which to exhibit, as is the case at Chiswick?—*A Gardener, Dartmouth.*

Flower Gardens—The Season.—Reading the Calendar of Operations, relating to the Flower Garden, I find that the writer, like many others, has suffered through the influence of this uncongenial season. I cannot, however, agree with him in the statement respecting bedded out plants. Indeed, from what has come under my own observation, I am fully convinced of the contrary. Last week I visited the gardens of the Rev. R. Boyl, Marston Rectory; likewise those of S. F. Phelp, Esq., Warminster, besides those at Longleat, the seat of the Marquis of Bath—and it is really gratifying to witness the vigour and beauty of the various beds in the different flower gardens. I have been in the habit of visiting each of those places for some years past, but never on any former occasion did they appear so exquisitely beautiful; and much praise is due to the gardeners, who, through perseverance, have rendered them such, under most unfavourable circumstances.—*E. C.*

Societies.

BOTANICAL SOCIETY OF LONDON.

July 5. Dr. Bossey in the Chair.—Specimens of the following plants were exhibited, sent to the Society by Mr. Hewitt Watson:—Carex elongata (Linn.) found abundantly in Weybridge marshes. This locality is interesting to the metropolitan botanist; the nearest habitat, previously on record, being in the county of Salop.—A pubescent flowered variety of Bromus commutatus (Schrad.) found plentifully, along with the more abundant glabrous form, in a meadow by the river Mole, between Esher and West Moulsey, Surrey. This variety affords another instance to prove the little importance which can be given to the character of smooth or downy flowers, as a specific distinction in this genus. It will form an addition to the London Catalogue of British plants, (b. pubens) to be entered under Bromus (1355) commutatus.—A specimen of Lolium multiflorum, the root of which was dug up, when in flower, in a sown field last year, and the plant is now copiously flowering in Mr. W.'s garden; thus proving its perennial existence, although the alleged annual root of L. multiflorum has been considered the best distinction between this supposed species and L. perenne. The other alleged differences are equally invalid.—Garden specimens of Festuca pratensis (Huds.) and arundinacea (Schreb.) to show the strongly marked differences between them; the latter being three times the size, extremely hard to the touch, and very dissimilar in its flowers, and mode of inflorescence. In F. pratensis the branches of the panicle are erect after flowering, the paleæ or glumes obtuse and awnless, and the sheaths of the leaves nearly smooth. In F. arundinacea, the branches of the panicle are horizontal or reflexed, the glumes acute and awned, and the sheaths and leaves very rough. Mr. W. admitted F. loliacea and pratensis to be forms of one species; indeed, he had shown this to the Edinburgh botanists, just after they had printed their Catalogue, in which F. loliacea is kept as a distinct species, while F. pratensis is united with F. elatior, (Linn). But he was not yet prepared to combine all three, and the F. arundinacea likewise, under the one name of F. elatior, as is done by Mr. Babington. Mr. W.'s plant of F. arundinacea was originally brought to his garden from the Isle of Wight, and is now a large sheaf, with hundreds of flowering stems, four to seven feet high, and the root-leaves half a yard long.—A specimen of Œnanthe pimpinelloides (Linn.), to show the cylindrical form of the fruit, which exactly corresponds with that of the Sardinian plant (admitted to be the true species), except in having less callosity at the base. This was taken from a plant in Mr. W.'s garden, the parent of which had been brought thither from a hedge bank in the Isle of Wight. Mr. W. recognised a second species in Britain, after sent to him under the name of Œ. peucedanifolia, and readily distinguished by its turbinate or elliptic fruit, on extremely short pedicels, and more resembling Œ. globulosa, than Œ. pimpinelloides. The peculiar form of the root to some other specimens, resembling that of a Dahlia in miniature, induces a supposition that there may be a third species, although he has satisfied himself that the roots vary greatly with age and situation, and do not afford such certain characters for distinction as may be found in the fruit. The Œ. Lachenalii (of Babington's Manual) is apparently the species frequently sent under the name of Œ. peucedanifolia, though occasionally named Œ. pimpinelloides by English botanists. He would illustrate this subject more fully on another occasion. Specimens of the garden Fennel, to show the little importance to be attached to the difference of the stems being fistulous or filled with pith. These specimens were sections of stems arising from a single root, of different dimensions, but of nearly equal age and stage of development. Some of them (the thicker) were hollow, others filled with pith. A question respecting a distinction of species, between the wild and garden Fennels, had been raised in consequence of one author describing the stems as fistulous, while another finds them solid; but since both conditions can exist on one root at the same time, such a distinction would be quite inadmissible for a specific character.—A stem of Hieracium Lawsoni, which had borne 20 flowers, in Mr. W.'s garden, this spring; and others had flowered more numerously than this one. In the wild state on the Grampians (the locality from which the plants were brought three years ago,) this species has usually two, three, or four flowers only. He had seen a wild Irish specimen, with six or eight flowers. No care had been bestowed upon the plants in his garden, except occasional watering in dry weather, and removal of weeds from about them. He sent the specimens merely as an example of the little dependence to be placed on the number of flowers on the Hieracia; indeed, among the Compositæ generally. A wild plant, growing free from the interference of other plants about it, might also increase its flowers five or ten fold, as practical botanists must be well aware from observation. —Read, A Synoptical View of the British Fruticose Rubi, arranged in Groups, with Explanatory Remarks, (Part 4,) by Edwin Lees, Esq., F.L.S. The paper was accompanied by drawings and specimens.

BOTANICAL SOCIETY OF EDINBURGH.

July 11.—This, the last meeting for the session, was held in the Royal Botanic Garden, Professor Graham in the chair. The Treasurer read a paper on three Genera of Desmidieæ, by Mr. J. Ralfs, Penzance, viz., Desmidium, Glœoprium, and Schistochilum. Mr. J. M'Nab read a portion of his Journal of a Tour in the United States and Canadas. In the last notice, Mr. M'Nab gave an account of the excursion from Albany to Troy, and thence to Stillwater, with notices of the most interesting plants observed during the journey thither: the present portion is chiefly confined to observations on the Botany of the same district. July 15. Few species rewarded their exertions, the greater portion being out of flower; of those gathered, the most attractive were Lobelia cardinalis, and Habenaria fimbriata, both in great abundance, the rich spikes of scarlet flowers of the former being admirably contrasted with the delicate purple blossoms of the latter; these two species formed the bulk of the flowering plants; mixed with them, but more sparingly, Habenaria lacera and Neottia cernua occurred, with Apocynum androsæmifolium, the latter being the most abundant, and covered with a beautiful coleopterous insect, which appeared to be peculiar to it. On the sloping banks of the river, in thickets of Sumacks, Hazels, Willows, &c., a gigantic species of Solomon's Seal, *Polygonatum latifolium*, was observed; some of the specimens measured seven feet nine inches in height, with roots four inches in circumference. In several places the ground was so matted over with the stems of the Poison Oak, *Rhus toxicodendron*, that the hands of the party were much blistered in

endeavouring to extricate themselves. July 16. Having procured a canoe, the party proceeded about two miles down the river; during this short voyage they observed vast quantities of the shells of the fresh-water mussel, covering the little sandy hills by the river's edge; they had been collected by the musk rats, with which the banks everywhere abound. At this place the rapidity of the stream, which had hitherto prevented the growth of aquatic plants, became much diminished, and they now observed large portions of its surface covered with Nuphar Kalmiana and advena, together with Nymphæa rosea, all beautifully in flower, and growing from a depth of eight feet. Overhanging the banks on both sides of the river, Salix petiolaris was in fine condition, its broad, lunate stipules adding much to the beauty and singularity of its appearance; here also, some fine specimens of the Virginian Poplar, *Populus monilifera*, were seen: the largest stems measured were nine feet in circumference, and about 70 feet in height. Leaving Stillwater the party proceeded by canal to Whitehall; on the banks of the canal, and extending over the neglected fields, such quantities of the Great Mullein, *Verbascum Thapsus*, were observed as to give the idea of its having been sown for a crop; the fact of its growing on the soil which had recently been thrown out of the canal, as well as on the sloping banks, convinced them that the seed must have lain buried in the earth, probably for a long series of years, and that, therefore, it is not likely, as has been generally supposed, that this plant has been introduced by the emigrants, but rather that it is indigenous to the country. The common St. John's Wort, *Hypericum perforatum*, was also extremely abundant in this district, although sparingly seen before, and is described by Mr. M'Nab as one of the greatest evils the American farmer has to contend with, being supposed to be highly injurious to cattle, especially horses, causing blindness, which prevailed in many parts to a fearful extent. On reaching Whitehall, situated at the southern extremity of Lake Champlain, two remarkable species of Ferns were observed for the first time; namely, Asplenium rhizophyllum, and Aspidium bulbiferum, the former growing on the surfaces of moist rocks, where it throws out its fronds, which take root at their extremities; while the latter bears a number of small bulbs along the rachis which, when mature, fall off and vegetate in the crevices of the rocks. Many other interesting plants were observed, but few of them in flower, with the exception of Rubus spectabilis, Desmodium acuminatum and canadense, and a few others. Mr. M'Nab afterwards exhibited several specimens of Gooseberries and Currants, which had been kept for the last two years in glasses, containing water only, in which they had now matured their fruit for the second time; and it was remarkable that the Gooseberries (Yellow Amber), and the Red and White Currants, were as highly flavoured as the same sorts under ordinary treatment.—Mr. Trevelyan exhibited specimens of some remarkable varieties of Taraxacum officinale, found on the sandy beach near Arbroath, and a curious variety of Aspidium filix fœmina from Braemar, having the frond branched at the extremity; the specimens were afterwards presented to the Society.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

July 20.—This Exhibition of plants and promenade took place at the Society's Garden, Inverleith. The day proved remarkably favourable, and the assemblage of company was brilliant. The plants were confined to the new Hall, the centre and side-tables of which were completely filled with choice exotics in flower. The large marquee which used to occupy the principal lawn having been removed, the whole of that beautiful piece of Grass was left free to the promenaders. This was not a competition meeting, and no medals were, therefore, voted; but honorary rewards were made to the chief exhibitors. The nurserymen contributed largely. Messrs. Dickson and Son sent a magnificent collection, including many of the new Pelargoniums and Fuchsias; among the latter, Edina and Exoniensis, the former a seedling raised at Inverleith, and remarkable for the large size of its blooms.—Messrs. Lawson and Sons exhibited a tray of novelties, including Quercus Mirbeckii, Daubentonia tripetiana, and Clerodendron brevifolium.—Messrs. Purdie and Merrilees showed some well-grown Heaths, and an admirable Lilium lancifolium cruentum, having 17 flowers and buds on one stalk.—Messrs. Carstairs, Kelly, and Co., sent a collection of greenhouse plants, including Hydrangea japonica and an admirably-flowered specimen of Roella ciliata, rarely seen in such perfection. From the same establishment was a plant of Myatt's Prince Albert Strawberry, remarkable for combining the qualities of high flavour with fruitfulness.—Among the productions of Amateurs, was a collection of Seedling Calceolarias, raised by Mr. I. Anderson. Several of these were fine, and in particular Prince Albert, King of Saxony, Duke of Buccleuch, Mary Queen of Scots, Orion, and Cupid, now exhibited for the first time, besides Queen Victoria, General Robertson, Countess of Rosslyn, Hon. Mrs. P. Ramsay, and Lord Justice-General, which had been shown at a former meeting.—Mrs. R. Haig sent tastefully arranged trays of Heaths, Geraniums, and Crassulas, with handsome flowering specimens of Cattleya Forbesii, Oncidium papilio, Erythrina laurifolia, and Calathea zebrina.—From Melville Castle were well-grown Heaths; also trays containing British and exotic Alpines, besides well-managed plants of Stanhopea insignis and Miltonia spectabilis.—Some admirably grown Heaths were sent from Rosepark, particularly Erica ventricosa prægnans, and E. tricolor dumosa; and a beautifully-flowered, though small, Pimelea spectabilis, and a new sweet-scented Verbena.—Professor Syme exhibited two specimens of Achimenes longiflora, the largest measuring 6 feet in circumference round the branches, and marked as a cutting of last year; together with two very large and high-coloured Cockscombs, and a noble Statice arborea.—Dr. Neill showed a remarkably fine Oncidium pulvinatum, having a flower-spike 7 feet long, superbly clothed with orange and yellow blossoms; besides well-grown plants of Zygopetalon maxillare and Calanthe veratrifolia.—Mr. Oliver exhibited some capital greenhouse plants, among which Phœnocoma prolifera, Erica princeps, and E. inflata, were truly striking.—Mr. Keith sent seedling Pelargoniums, and a tray of lovely greenhouse plants.—Captain Falconer exhibited 80 varieties of French, Hybrid China, and Moss Roses.—From General Robertson was Viscaria oculata, a new hardy annual.—From Mr. Henderson were double Marigolds, Dahlias, and a well-grown specimen of Gesnera faucialis.—Mr. Symington showed Pansies.—Mr. R. Girdwood, a fine flowering plant of Phlox bicolor, newly imported from the United States.—Mr. Edmond showed Pinks; and Mr. Cushnie, two fine specimens of Statice puberula, covered with flowers.—An Oleander-plant from the Society's garden excited much attention, being 5 feet high, and in full flower, although it had been hanging in the air for the last three years, and supported wholly by moisture supplied by a syphon of worsted threads, communicating with a small suspended jar containing water. Among other choice plants from the same collection were Nepenthes distillatoria, 7 feet high, and displaying its curious pitchers; large flowering specimens of Lilium japonicum and Cereus speciosissimus; with Campanula stricta and Drymonia punctata.—Mr. Montgomerie sent specimens of the Precoce de Tours Plum, from an open wall without artificial heat; the fruit had already made considerable approach to ripeness, and is found to be earlier, on the west coast of Scotland, than the White Primordian or than Wilmot's Early Orleans.—Specimens of ornamental flower-pots, and vases for containing flower-pots, constructed of zinc, were exhibited by Mr. Macintosh, of Edinburgh.

Reviews.

Essays on Natural History, chiefly Ornithology. By C. Waterton, Esq. 12mo. Longmans.

Who is there that loves the woods and the fields, and the living things which fill them, who does not admire the honest, straight-forward zeal of Mr. Waterton? which, whether directed towards the maintenance of his religious and political opinions, or the description of his adventures, or the elucidation of the habits of his winged favourites, is always full of entertainment and instruction. We are neither Catholic nor Jacobite; but the best Protestant, and stanchest Hanoverian, can scarcely read Mr. Waterton's autobiography, without having his misgivings as to the possibility of either Reformation or Revolution having been effected, had all the friends of the fallen causes possessed his energy and honesty of purpose.

What renders Mr. Waterton so particularly agreeable is, his sterling English feeling; his unconcealed contempt for *namby pamby*, in thought, word, or deed; and the skill with which he brings his great powers of observation to bear upon the subjects of his pen. With him there is no trusting to other people, no borrowing from books, no repetition of the hackneyed tales of credulous naturalists, but all is as pure as the air that blows over the lake of Walton Hall. The reader feels that he is a man to be implicitly trusted; and no one rises from the perusal of his writings, with a doubt about the perfect truth of his narrative.

The present volume is an instance of his benevolent character. It is published for the benefit of Mrs. Loudon and her little girl, and we have no doubt that it will prove a very effectual assistance to them. We can confidently say, that it will amply repay the reader for its perusal. It treats too little of botany and gardening, and too much of owls and rollers, squirrels, wrens, robins, swans, Canada geese, and caymans, to furnish us with much that can be advantageously extracted. The following extracts will, however, as we hope, tempt the lovers of natural history to become acquainted with the remainder of the book:—

"*The Wren, the Hedge-Sparrow, and the Robin.*—The song of these three well-known warblers may be termed perennial. Formerly it was very rare for me to hear the notes of the second whilst the storms of winter raged through this little valley. But now it is otherwise; for the yew shrubs, which have grown up into a spacious cover, seem to be more congenial to the habits of the hedge-sparrow than any other evergreen; and it may be seen perched near the top of these, and warbling there, from time to time, in every month of the year. There is a problem to be solved in the economy of these three soft-billed little birds, before we can safely come to the conclusion that severity of climate, and want of food, are the real causes why our summer birds of passage leave us shortly after the sun has gone down into the southern hemisphere. Like them the wren, the hedge-sparrow, and the robin, are insectivorous, and they differ not in the texture of their plumage; still they do not accompany their departing congeners, but prefer to remain in this cold and stormy quarter of the world, throughout the whole of the year. They may certainly suffer more or less during the chilling period of frost and snow; nevertheless, their breed is always kept up; and we find, on the return of spring, that they have not suffered more than others which are apparently better suited to brave the rigour of an English winter than they are. There is yet another point which wants settling in the habits of these birds. I allude to their song. When we are informed that incubation is the main inducement to melody in the feathered tribe, we have only to step out after sunrise into the surrounding evergreens, and there we are sure to hear either the wren, the hedge-sparrow, or the robin, in fine song, although not a single twig has been laid, or a piece of Moss produced in furtherance of a nest, wherein to raise their future young. Certainly, in this case, neither love nor warmth could have had any hand in tuning the winter lyre of these little sons of Orpheus. The wren is at once distinguished in appearance from our smaller British songsters by the erect position of its tail. Its restlessness, too, renders it particularly conspicuous; for, when we look at it, we find it so perpetually on the move, that I cannot recollect to have observed this diminutive rover at rest on a branch for three minutes in continuation. Its habits are solitary to the fullest extent of the word; and it seems to bear hard weather better than either the hedge-sparrow or the robin; for whilst these two birds approach our habitations in quest of food and shelter, with their plumage raised as indicative of cold, the wren may be seen in ordinary pursuit, amid icicles which hang from the bare roots of shrubs and trees, on the banks of the neighbouring rivulets; and amongst these roots it is particularly fond of building its oval nest. The habits of the hedge-sparrow are not quite so solitary as those of the wren. It will approach the window in cold weather, and there pick up a scanty meal with the robin, the chaffinch, and the house-sparrow. Still, we very rarely see three hedge-sparrows in company. As these birds inhabit low shrubs and the bottoms of Hawthorn fences, and are ever on the stir amid old pieces of wood and lumber, put apart for the use of the farm-yard, we cannot be surprised that they, as well as the robin and the wren, which are fond of such localities, should fall an easy prey to the cat, the weasel, the foumart, and Hanoverian rat, which last all the world knows to be uncommonly ravenous. The last of this sweetly-warbling trio, whose habits I am attempting to describe, is pretty cock-robin, the delight of our childhood, and an object of protection in our riper years. Wherever there is plenty of shelter for him his song may be heard throughout the entire year, even in the midst of frost and snow. In the whole catalogue of British birds, cock-robin is the only one which in his wild state can be really considered familiar with man. Others are rendered tame by famine and cold weather, and will cautiously approach the spot where food is thrown for them; but the robin will actually alight upon your table, and pick up crumbs on your own plate. When I have been digging in the pleasure-ground he has come and sat upon my spade; and by every gesture proved his confidence. You cannot halt for any moderate time in the wood but cock-robin is sure to approach, and cheer you with an inward note or two; and on such occasions he has more than once alighted on my foot. This familiarity is inherent in him, and not acquired. I am not acquainted with any other wild bird that possesses it. In Italy this social disposition of his does not guarantee him from destruction by the hand of man. At the bird-market near the Rotunda in Rome, I have counted more than 50 robin-redbreasts lying dead on one stall. 'Is it possible,' said I to the vender, 'that you can kill and eat these pretty songsters?' 'Yes,' said he, with a grin; 'and if you will take a dozen of them home for your dinner to-day, you will come back for two dozen to-morrow.'

"*The Yew tree.*—I never cast my eyes on the mouldering fabrics which once adorned this land, without renewing my veneration for the memory of the holy and useful monks who have gone before us. There is still enough left of the falling walls to show how much these faithful friends of the poor and needy must have been esteemed through the whole extent of the nation; and when I sit me down under the dark foliage of some ancient Yew-tree, which has escaped the fury of the destroying Vandals, and think of the miserable state to which the sons of poverty are now reduced, I cannot help heaving a sigh, whilst my very heart itself seems to sink within me. I am extremely partial to the Yew-tree. It has already repaid me for the pains which I have taken in its cultivation; and when I resort to my usual evening stand, in order to watch the flocks of sparrows, finches, and starlings, whilst they are dropping in upon the neighbouring Hollies, I feel not the wintry blast; as the Yew-trees, which are close at hand, are to me a shield against its fury; and, in fact, they offer me a protection little inferior to that of the house itself. I have not been sparing in the arrangement of ornamental Yew-trees. Just 60 yards from the bridge, which joins the island to the main, there is a Yew-tree crescent, 300 feet in extent; and not far from this there are some fine clumps of the same plant, producing a very pleasing effect. Should he who will succeed to them when I am low in dust have the philosophy to set at naught the modern disapprobation of ornamental planting in lines and circles, he will always command the sweet warbling of unnumbered songsters, from earliest spring to latest summer; for the Yew-tree is a kind friend to the feathered race; and the wren and the hedge-sparrow will sing sweetly amidst its foliage throughout the autumn, and even after the winter season has set in. The cultivation of the Yew-tree is sure and simple. It will thrive in any soil that is clear of swamp; but, the richer the soil, the richer is the appearance of its foliage; and if the planter will trench his ground from two to three feet deep, throwing back into the bottom the worst of what has been removed, and reserving the best for the

upper stratum, he is sure to be handsomely requited by a rapid growth of the trees. Although the Yew-tree is a hardy plant, and fond of cold regions (*amantes frigora taxi*), still it will be much more vigorous in the sheltered valley than on the bleak hill exposed to the wintry blast. Our western gales here in Yorkshire press far too keenly on its foliage, and render the side which is exposed to their fury as thin and wretched in appearance as the face of a metropolitan alderman would be on Easter Sunday morning, after having struggled through 40 long days of unmitigated fasting. Provided you do not care about having your Yew-tree in all the exuberance of uncurbed vegetation, you may apply the pruning knife and shears with a safe and an unsparing hand; for the Yew-tree will submit to curtailment with good effect, and without any apparent diminution of vitality. If we clip its southern side in imitation of a wall, and allow that which faces the north to flourish in its natural state, we shall have from the same line of trees a walk impervious to the blast of Boreas for ourselves, and a provision of berries for the birds, at a time when their more ordinary supply of food is considerably on the decrease. Charming is the appearance of the Yew-tree after the sun has passed the autumnal equinox. The delicate crimson of its fruit, with the dark-green leaves behind it, produces an effect so pleasing to the view, that it can scarcely be surpassed by anything which the southern forests present to the lover of Botany, as he wanders through their mazes."

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

PENTAS CARNEA. Flesh-coloured Pentas. (*Greenhouse Shrub.*) Rubiaceæ. Pentandria Monogynia.—This beautiful half-shrubby plant has been lately introduced to this country from the Continent, and grown in several of the gardens and nurseries about London under the name of Sipanea carnea. It was first received at the Botanic Gardens of Kew, from Mr. Mackoy of Liège, and has since been obtained by Messrs. Rollisson and others, from the Jardin des Plantes at Paris. No memoranda were furnished with these plants respecting the native country of the species, and we are, consequently, unable to state with certainty what part of the world claims it as its production. Another species of the genus, P. parviflora, having been discovered by Dr. Vogel, in the late Niger expedition, growing in the western part of Tropical Africa, near Accra, and other plants nearly allied being found in the same neighbourhood, Sir William Hooker, in the "Botanical Magazine," conjectures this to belong to the same locality. As an ornamental plant for the stove, or possibly for a warm greenhouse, this will be hailed as an acquisition of some importance. It has an excellent robust habit, and produces a number of partially-spreading branches, forming a handsome bushy plant, clothed with an abundance of large, broad foliage, concealing the stems to the very base with its lively verdure. These branches usually bear flowers as they are formed, even when the plant is in an exceedingly dwarf state, without appearing to have any injurious effect on the continuing growth of the specimen. The blossoms are collected into corymbose clusters and stand erect, displaying their lovely soft flesh-coloured hue to the utmost advantage. When the flowers are first developed they are very pale, but gradually acquire colour with exposure. If the plant is kept growing in a favourable situation, it will continue to blossom, with the formation of new branches, for the greater part of the year; and such is the rapidity of its growth, that it will form a large bush in the course of a single season. Like most soft-wooded plants of quick growth, it requires a rather large pot, and a strong soil, rich in nourishing properties. And it will probably be beneficial to use an occasional application of manure water, to increase its vigour, especially where large specimens are desirable. In the summer months there is little doubt that it will be found to succeed satisfactorily in a close greenhouse, although in winter and spring a little more warmth is necessary. It is easily propagated by taking off the extremities of the young shoots as soon as they have acquired a little firmness; and, inserting them in a pot of sand, covered with a bell-glass, and placed in heat, they will take root in ten days or a fortnight, and should be immediately potted into separate pots and encouraged to grow. The generic name, Pentas, has been applied by Mr Bentham, from the division of the corolla being quinary instead of four cleft, as in other allied genera. Although general, this is not constant, as flowers on the same head are four and five-parted. Three or four plants, which have hitherto been arranged under other genera, are suspected by Mr. Bentham to belong rightly to this.—*Paxton's Magazine of Botany.*

STENOMESSON Hartwegii. Mr. Hartweg's Stenomesson (*Greenhouse bulb.* Amaryllidaceæ. Hexandria Monogynia.—A pretty little bulbous plant found by Mr. Hartweg at the Hacienda del Ixo, on the ascent to Antisana, in the province of Quito, at the height of 11,800 feet above the sea. It has pretty orange-coloured nodding flowers, growing in pairs. It should be potted in a compost consisting of peat and sandy loam in equal proportions. In spring and summer, while the plant is in a growing state, an ample supply of water should be given, but in autumn, when the leaves begin to die off, this should gradually be withheld, and for a few weeks in winter kept quite dry. The temperature in a warm greenhouse will be quite sufficient.—*Botanical Register.*

Garden Memoranda.

Mr. Glendinning's Nursery, Chiswick.—This nursery, although one of the oldest in the neighbourhood of London, had almost dwindled into nothing; but during the last season it has undergone great improvement, and several hothouses are now erected for the cultivation of exotics. The houses, although not large, are admirably contrived to admit of watering and inspection; indeed, every plant may be said to be under the eye of the cultivator. The plants are, nevertheless, at the same time, all near the light, which is a most important point in hothouse building, and one too frequently made of secondary moment—especially when architects are employed in the erection of these structures. The propagating-house is well contrived for the purpose, and is heated by one of Burbidge and Healy's improved boilers, and the bottom heat is communicated by hot water, in iron gutters manufactured by the same party, which answers admirably. Mr. Glendinning approves of iron gutters in preference to those formed of brick, and rendered water-tight by cement; and his reasons are, that he considers them more economical and more durable, and also much less likely to leak. Besides, in case of any alteration, iron gutters can be removed in a very short time, and again re-erected, whereas no new arrangement of brick and cement can be effected without total destruction. The gardening world, therefore, owes much to Mr. Corbett, who originally brought iron gutters into public use for heating the atmosphere of horticultural buildings. The plants in the several houses were in vigorous health, and embrace many new species. Among others, we remarked Hallia flaccida, covered with beautiful small lilac blossoms, about the same size, and having considerable resemblance, except in colour, to those of Chorozema ovata; here was also in bloom Clerodendron infortunatum, a most beautiful species, having large and very brilliant clusters of scarlet flowers. This is a great acquisit on to gardens, as it is a free grower, and produces a fine head of bloom while in a very young and dwarf state. With regard to treatment, it likes plenty of moisture during summer, and does not require a high temperature, which is apt to cause it to grow tall and straggling. Gloxinia Cartoni was blooming finely here, as was also another variety, named bicolor, having pretty lilac blossoms with a white centre. In this house Mr. Glendinning called attention to what he considered to be a new yellow-flowered Rondeletia, clothed with abundance of fine foliage, about 6 inches long, but it was not in bloom. In the same collection was the charming Thunbergia chrysops, remarkable for its "eye of gold in a field of the richest purple." This being of a somewhat shrubby nature, appears to be of a more permanent character than other species of the same genus. Hindsia longiflora, a greenhouse plant of considerable beauty, resembling the old Bouvardia triphylla in habit, and requiring nearly the same treatment, was producing its purplish-blue flowers freely; as was also Gloxinia magniflora, a new variety with delicate pink blossoms; and near to this was situated a noble Statice arborea, producing three fine spikes of bloom. In the same house we remarked a plant of Gardenia Sherbourniæ, a handsome stove climber, having large bell-shaped flowers, white on the outside, and of a deep red within, which forms a fine contrast with the beautiful dark-green foliage. Among other things we observed Habrothamnus fasciculatus, which, from having the shoots well stopped in, was forming a fine bush covered with large healthy foliage. When in flower this presents an unbroken mass of crimson blossoms, and is one of our most beautiful greenhouse plants. Here was likewise a Gesnera, said to be G. macrorhiza, producing large bright-scarlet flowers in pairs; and in the same house was, also in bloom, a plant of Lisianthus glaucifolius. The collection of Heaths was in fine condition, comprising upwards of 200 of the best kinds, and including some scarce and valuable sorts. We remarked among others the beautiful free-flowering Savileana, good plants of Ampullacea, Lawsonii, with small pink blossoms; Jasminiflora alba, which is one of the best Heaths; and another variety of Jasminiflora named Vittata, together with Irbyana, and several varieties of Macnabiana, with many others in good health and equally indicating judicious management.

Miscellaneous.

The Cineraria, and its Culture.—The name Cineraria has been given after the Latin word *cineres*, on account of the ash-coloured down which covers the under side of the leaves. The most beautiful sorts of this genus come from the Cape and the Canary Islands; they have been successively introduced into Europe during a period of about 60 years. The leaves of some of them are formed like those of the Poplar (populifolia), others are in the form of a heart, and some again have a down upon their leaves (lanata); there are also certain sorts, amongst which is cruenta, whose foliage has a smooth surface. By the mutual fecundation of these different sorts, first the English and afterwards the Belgians, have raised numbers of novelties, each more beautiful than the other. These have again successively given place to other newer and more interesting kinds. It is thus that we have seen mentioned in catalogues, for about 10 years past, during which this plant has occupied attention, at least 300 varieties. Nevertheless, of these only a few are now considered worthy of cultivation. At the present time there are imported new varieties quite distinct from one another; this number is, however, very inconsiderable, and does not surpass 25 varieties. These beautiful Cinerarias, some of which have been obtained from seeds, in Belgium and also in France, will serve as new types from which to obtain, by judicious fecundation, farther improvements in this beautiful genus. Regarding the qualities of the Cineraria as a florist's flower, I have remarked for some years at the Exhibitions of Brussels, Ghent, Malines, Liége, and Antwerp, that skilful florists attach the greatest importance to those kinds which carry themselves well. They prefer those which flower abundantly, and whose flowers are large and well-made; that is, whose petals are nearly broad enough to fill the spaces between them. To these qualities a good variety should also add beauty of tint, and richness of colour. The improvements of which Cinerarias are susceptible, consist in obtaining the petals broader, and having novelty of lively and brilliant colours, and at the same time possessing the qualities above mentioned. This plant is not difficult to cultivate; nevertheless, there are some rules to follow, if well-grown plants and an abundance of bloom are to be obtained; you must prepare beforehand at least a year, if you wish to be successful. Young plants in small pots, bought in from nurseries, about the end of March, may be placed in a greenhouse, where they will not be far from the glass, but they should not be allowed to receive directly the rays of the sun. The plants ought to remain for some days in this situation, and in the mean time soil may be prepared into which to repot them. This should consist of thoroughly decomposed leaf mould, mixed with an eighth part of soil from an old hot-bed. After the first potting, when the plants have taken certain hold, re-pot them again, taking out the crocks without disturbing the roots. As the plants become larger, the compost may be made richer, and mixed in the proportion of about three parts of leaf-mould to one of soil. The first potting should take place about the 15th of April, and the second in about a month afterwards; at every potting take a pot broader and higher by half an inch than the ball of the plant, and see that the upper roots are not covered too deeply with soil, for that is hurtful in general to all plants. At the commencement of June every Cineraria should be sticked and exposed to the air, placing them where the heat of the sun does not penetrate upon them with too much force. During the months of June and July, great care should be taken to water them, particularly in the afternoon, and when the sun has ceased to shine upon the plants. They may also be watered in the morning before 8 o'clock, without any danger. Towards the end of August, or a little earlier, you will observe at the base of many of the plants little shoots which proceed from the roots, the stem, and the axils of the lower leaves. They speedily root in the upper layer of the ball, and should be carefully taken up, as much for multiplying the rare sorts, as for clearing the plants of young suckers, which would otherwise take away a part of the sap which the plant requires to strengthen it, in order to become a good specimen. If Cinerarias are treated in this manner, they will be covered the following spring with rich and abundant flowers. The little suckers taken up may be put into pots of a proportionate size, placed in a hotbed and shaded from the sun, where, in 15 days at most, in August, the roots will show themselves all round the ball. They should then be put into larger pots, placed close to the window of a greenhouse, and exposed to full light; where they may remain until spring. The parent plants should be put into a cool greenhouse, or frame, about the 15th of October, and remain there all the winter; they may receive as much light, air, and sun, as possible. Towards the end of January place them farther from the glass at the top of the house, and continue to give them as much air as possible in fine weather. If it is desirable to delay the time of flowering a month or six weeks, pot the plants again into larger pots by an inch, before the flower-stalks rise, and the flowers appear towards the beginning of March; large specimens remain in bloom at least six weeks. Cinerarias fertilise readily, and seed abundantly, particularly when they are placed in a dry situation, where they have air, and every morning receive a sufficient watering. As soon as the seeds are ripe, they should be gathered and put into a dry place, but only for two or three days. Afterwards you must clean the seeds well, and sow them immediately in very fine and rather sandy leaf mould. They will come up in a fortnight or three weeks afterwards; the young seedlings should be pricked out as soon as they have two well-formed leaves, and two others are beginning to show themselves. These seedlings should be placed for eight days in a hotbed, sufficiently warm to induce them quickly to strike root again. As soon as the young plants have unfolded and formed their first leaves, they ought to be potted afresh, and eight days afterwards placed in the open air, in order to strengthen them before autumn, so that they may the better endure the winter. The seedlings may afterwards receive the same treatment as older plants. A great number of these seedlings, provided they are well taken care of, flower in the spring. You cannot be too careful to take exact notes of seedlings raised from different varieties, until you ascertain which sorts give the best result. If green-fly attacks the plants during winter, that insect may be speedily destroyed, without danger to the plant, by fumigating the house with tobacco-smoke. In spring this should be done very gently, for if the tobacco is too strong, the plants will be injured by it, and perhaps perish. You can never throw tobacco on them in the form of snuff or otherwise, for the contact of the tobacco would quickly kill the Cineraria. It is, therefore, in spring much better to destroy the green-fly with the fingers, as fast as it appears. In fact, unless you have a greenhouse expressly for this sort of plant, you cannot burn tobacco without hurting other specimens, which are not at the time in flower. The Cineraria has very little scent; it does, however, very well, while in flower, to be placed in the window of an apartment exposed to the sun. It flowers there as well as in a greenhouse for a considerable time; on fine days in April and May, admit air into the room, at least one hour every day. In this point of view it is, perhaps, the most convenient for a drawing-room, and for this reason it may be expected to become a general favourite.—*J. de Jonghe, in Revue Horticole.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

STOVE PLANTS which flower late in the autumn, and especially those that may be taken to the conservatory to bloom, should now, or very soon, be in their flowering-pots. The Eranthemum pulchellum, several Justicias, Aphelandra cristata, Poinsettia pulcherrima, Echynanthus grandiflorus, and many more of that character belong to this class. Another very essential point to be observed with stove plants in general, which are removed to the conservatory while in flower, is to have the compost lighter for them, and not give them more pot-room than will just keep them healthy, with the assistance of liquid manure, as plants of this nature suffer very much in a cool conservatory late in the season, if they are growing in heavy rich composts, and in large pots; whereas, in a stove, that would be the right way to make them flourish.

Conservatory.—No matter how soon in August the Dutch bulbs for very early forcing are potted; the more roots these bulbs make before they are brought into heat, the better. In Holland, the bulbs for the first crop are well established in pots before we begin to think of "ordering" ours. Gesnera elongata, Crowea saligna, and some of the Correæas, will now

stand more heat; and with a little forcing they may be brought into flower a month sooner. Look well to your late autumn-flowering plants for this house; Heliotropes, Sweet Briar, Mignonette, Lemon-scented Verbena (Aloysia), and Fairy Roses, with the "Rose-scented Pelargonium," are always in requisition for bouquets after the middle of October, or as soon as the early frosts nip them out of doors. Look to every plant one by one, and then order such and such treatment as the different cases may suggest. This has been a trying season for the best gardeners. Besides thus exercising our patience, a large addition is made to the stock of our experience, upon which we can fall back more readily in future.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

In answer to the question propounded last week—What is to be done to counteract the evil consequences attendant upon our flower garden decoration by cold, wet, or dry seasons? it may be remarked, that an improvement will be effected in the first place by a thorough drainage and pulverisation of the soil to the depth of at least two feet. This will allow of a free percolation and distribution of moisture throughout the whole mass of the soil, and that not only of the moisture which falls in the form of rain, or is applied by the hand of man, but also of the moisture which is ever finding its way through the crust of the earth by capillary attraction. Nor is it moisture only which escapes more freely by a deep stirring of the soil and thorough drainage, but also terrestrial heat. All practical men know the advantage of deep trenching for kitchen-garden crops, especially in dry seasons, and what is good of one crop must also be good of another. Now where flower-gardens are situated on a subsoil of strong retentive clay, as is the case here, it will be the best to remove it to the depth of two feet, placing six or eight inches of brick rubbish or rough stones over the bottom of each bed, and making the remainder good with fresh top and pit loam. To do this in large gardens will be attended with considerable expense and labour, and therefore as a makeshift it will do considerable good to remove only a part of the bad subsoil, and then mix the remainder with brick rubbish and half-decomposed vegetable refuse. However, to follow this matter out satisfactorily will require more room than I can spare this week, and I therefore must leave the rest for another time.

Rosery.—Proceed with budding where the bark rises freely, but if it is dry defer the operation until we get more rain. We have lately been over our best Roses, and instead of cutting out the dead flower-buds have trimmed out all the weak shoots, only leaving such as will be required at the winter's pruning. The buds on those left will get much stronger in consequence, and we calculate upon a finer bloom than usual next season. The half-ripened wood of Chinese Tea, Bourbon, and Noisette Roses strike freely at the present time, and until the end of September, if placed on a little gentle bottom heat; and these are things which every garden ought to be covered with. —*W. P. A.* [Errata last week.—In line 19, for "under ones," read "tender ones."]

III.—FLORISTS' FLOWERS.

Tulips.—These bulbs may now be divested of their superfluous skins, and thoroughly cleaned, whenever the florist can spare time. *Dahlias*—Should be constantly watched and regularly tied as they advance, as the side shoots are extremely apt to be wrenched off by the wind. *Pansies.*—Seed may continue to be sown, and beds made of rooted cuttings. *Pinks.*—Whilst the weather continues showery plant out the pipings. They may also still be struck with success. *Carnations.*—Through every stage of their growth these beautiful flowers have their enemies, from the time of potting out till the period of planting again arrives. We have in successive Calendars noticed these depredators, and endeavoured to point out, as far as our experience went, the best way of destroying or guarding against them. No season that we recollect has been more prolific in those "insidious gentry" styled earwigs, or what the north-country folks provincially call "battle-twigs;" nor did we ever know them to have been more troublesome, getting into the calyx of the flower, and eating off the petals, to the florist's utter dismay and mortification. Many plans are adopted to entrap them; amongst the most simple and efficacious are dry Bean-stalks laid across the pot, in which they retreat during the day, or small pots filled with moss placed on the top of the sticks; these must be examined every morning. Still we are not sure that these are effectual preventives, as most certain it is that these insects can fly. Get on with layering as quick as possible, and when pods are swelling extract the decaying petals.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Attend well to keeping the bottom heat regular, and to the re-potting of such plants as require it, in order that the plants may receive no interruption in their growth. Should the weather prove stormy (as it now is with us) the linings of pits heated by means of dung alone, will require strict attention. Let all suckers worth saving be stuck into the tan, or potted immediately after they are taken from the parent plants, as they suffer much at this season by being allowed to lay exposed to the air. Planted in the tan in front of any of the pits, having a bottom heat of about 90°, they soon become well-rooted plants, fit for 6 or 8-inch pots.

Vineries.—In the houses bearing crops of Grapes for winter use, the surface of the border should not be made wet after the middle of August, and if water at the root is at all required, it should now be given; and after this let the surface become quite dry, so that no vapour may arise from it to injure the Grapes during the dull weather that we may expect before the fruit is all cut. The Hamburgh, Chasselas, and Sweet-water Grapes will ripen without any heat but that of the sun. Muscats in dull weather will be benefited by slightly heating the pipes or flues.

Peach Houses.—If the lights have not been taken off the early forced Peach-house, it should be done as soon as possible, that the trees may have the benefit of the free air, rain, and dews; all of which will not only assist to feed and perfect the buds for the following season, but also to keep them from the attacks of red spider, which at this time is difficult to keep down under glass. For the management of the late houses, see last week's Calendar.

Figs.—Figs are much better flavoured when ripened in an atmosphere not too moist and warm, and with a free circulation of air. Keep the red spider in check, or you will have no good fruit in the autumn.

Melons.—Continue to stop and thin the shoots of the Melon plants, supply them with water when necessary, and use every means to keep down red spider and thrips.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Fruit trees.—Attend to the removing the breast-wood of Apples, Pears, Cherries, and Plums; shortening the leading shoots and cutting back to a couple of inches the side-shoots of Currants and Gooseberries (unless when the latter are made to bear almost exclusively on young wood), and thinning and shortening the shoots of Apricots and Peaches, as previously recommended. Cover with mats, or thin cloth waterproofed, those Cherries, Gooseberries, and Currants that you wish to preserve as late as possible, and defend the remainder from birds by netting. This is a much more pleasant method than making the vain attempt to exterminate the feathered tribe, which, to say the least of it, is very questionable for its propriety, so far as utility is concerned. It is only during the fruit-season that blackbirds, thrushes, &c. interfere with our comforts, and for a little peculation now they amply repay us, by the quantity of slugs, &c. which they devour in spring, to say nothing of their cheerful notes at "early morn and dewy eve." Complete toleration has been proclaimed here to a group of starlings that build their nests for successive years in the same place. I am not aware that the starling ever interferes with our comforts, while the mass of enemies to gardeners which he destroys, for the feeding of his young, is truly astonishing.

Green Manure.—For several seasons I have dug down early in summer the plot of winter Spinach when it had attained the height of two or three feet, and planted the space with Brussels Sprouts, Scotch Kale, and Savoys, for an early supply, and the vigour with which they have grown convinces me that such a method might be adopted with great advantage, where manure was scarce and ground plentiful. *Onions.*—Preparations should now be made for sowing thickly the Strasburgh, or any other hardy sort, to stand over the winter and furnish large Onions early next summer. Part of them may be drawn for Salads during winter, and the other thinnings planted out in March. Sow again in a fortnight. Ground previously occupied with early Cauliflower, or Strawberries that require digging down, will furnish good situations.—*Peas.*—Make the last sowing, choosing the earlier varieties. Prince Albert is the earliest I have met with by eight or ten days, but otherwise it is a small Pea, and produces sparingly. The early *May* is highly spoken of as being as early as the Albert, of a good size, and producing plentifully. *French Beans.*—Sow in a situation where it will be suitable to defend them from early autumn frosts with mats, choosing the dwarfest sorts, such as the Early Dew, and the Robin-egg China. *Routine.* — See former Calendars.—*R. F.*

VII.—COTTAGERS' GARDENS.

Proceed with the thinning of Grapes, as recommended last week, and be careful in handling the bunches to twist the stems as little as possible, for fear of injuring them, and thereby preventing the fruit from swelling. Pelargoniums, which were directed to be placed out of doors, should now be cut down, and cuttings of the best sorts prepared and inserted in small 60-sized pots, in a mixture of loam, leaf-mould, and sand. They should be placed in a shady situation until they have struck root, when they may be more exposed to the sun. After the old plants have made young shoots about an inch long, proceed to re-pot them into pots one or two sizes smaller than those in which they are; shake the old soil from their roots, which should be pruned in to within 3 inches of the stem; and give them a good drainage, which is very essential to their future welfare. The plants should afterwards be placed where they will be partially shaded, receiving a little of the morning sun only. In a short time they will have formed new roots, and may be removed to a more open situation, where they may remain until the weather becomes cold, when they should be removed under cover. Calceolarias and Cinerarias, if not already done, should now have their roots divided: they may be planted in shady places in the flower-borders, to be taken up and repotted about six weeks hence; or they may be put into small pots, to be shifted as they require it, which will not be for some time. A small bed of Endive, if not already done, may be sown. Go over Cucumbers occasionally, to stop and regulate the shoots. Attend to getting up Onions, Shallots, Garlic, &c., that have arrived at maturity, for if left too long in the ground they often make a second growth, which spoils them for keeping.—*J. M'H.*

State of the Weather near London for the week ending Aug. 1, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Asphalte.—*J. W.*—This material is light, and will last a long time if kept painted. It makes good garden screens, when nailed to wooden frames. But it is not a strong fabric, and therefore cannot be employed where strength is wanted.

Books.—*G. Walker.*—"Hooker's British Flora," last edition. ——*A Subscriber.*—"Bevan on the Honey-Bee."

Brugmansia floribunda.—*P. P.*—You keep your plant too cool and too dry. It wants a damp stove, where Orchidaceæ are grown, and there it should be tied to a block of wood, and treated like an epiphyte.

Cucumbers.—*Anon.*—Where bees and other insects have free access to your Cucumber plants, there is no need to impregnate them artificially; but it is better to make success certain by doing so.

Flower-gardens.—*J. M.*—If you can furnish any practical information upon the management of flower-beds in dry, hot weather, we shall be happy to receive it. We cannot perceive anything beyond "talk" in the note before us.

Ice-houses.—We have to thank several correspondents for their kindness in pointing out a description of an American Icehouse in Cobbett's "Cottage Economy." We propose shortly to extract it for the benefit of ice-loving people.

Insects.—*W. W. W.*—Your larva had eaten a hole in the paper and escaped: it ought to have been inclosed in a quill. *R.* ——*A. P.*—Your Cucumber (?) plants are infested by Aphides, which will be best eradicated by fumigation with tobacco. *R.*——*H. W. B.*—The caterpillars eating your Potato haulm, &c., are the offspring of Noctua (Agrotis) exclamationis, and *R. W.'s* caterpillars destroying the Mangold Wurzel will change to a moth called Agrotis segetum. The history and figures of the above were published in the 4th vol. of the Royal Agricultural Journal, where the best means of freeing land of these destructive animals was discussed; but turning in ducks and hand-picking are the surest remedies. No. 1 is Tortrix fulvana; 2, Noctua orbona. *R.*——*N. O. P.*—Mr. Curtis will feel obliged by the Caterpillar being sent to 11, Robert-street, Hampstead-road.

Local Societies.—A Cheshire correspondent asks if we consider it fair to appoint as judges the same two individuals at every Exhibition, from the formation of a society; and those individuals nursery foremen in the immediate neighbourhood, who, at the last Exhibition, were walking to and fro in the tent while the gardeners were staging the plants, &c. There can be only one opinion on the subject. It is most improper for the judges to hold any communication with the exhibitors, and it is very unwise to appoint nurserymen or their foremen as judges. Not that they are unqualified, but because experience shows that people are apt to suspect them of favouring their customers; and although such an imputation may be, and often doubtless is, unfounded, yet no well-managed society will run counter to the feelings of exhibitors on so tender a point. Indeed, we wonder that any nurseryman should like to be placed in the position of a judge.

Melons.—*Anon.*—The bursting of fruits is generally owing to irregularities in the flow of sap; when the latter is suddenly and excessively urged by much heat and moisture, beyond the rate at which it had been previously moving, such fruits as have thin skins, and little fibre comparatively with their weight, as is the case with Persian Melons, are apt to be affected by the vicissitude. In order to prevent the bursting of Persian Melons, Mr. Knight elevated the farther extremity of the fruit as much as 30 degrees above the footstalk, and the same plan has been successfully adopted by others.‖

Names of Fruits.—*J. L.*—Your Plum is the Myrobalan, or Cherry Plum.‖

Names of Plants.—*A. R. C.*—Astrantia caucasica; Sedum oppositifolium.——*A. X.*—Carex hirsuta.§

Pelargoniums.—*J. Matthews.*—Procure the following sorts:—Matilda, Garth's Witch, Foster's Sir R. Peel, Duke of Cornwall, Erectum, Oberon, Pulchellum, Queen Phillippa, Wizard, Cyrus superb, Garth's Constellation, and Symmetry.*

Picotees.—*C. H. H.*—Wilmer's Princess Royal, Wilson's Pluperfect, Wildman's Isabella, Sharp's Wellington, Jessop's Sir W. Middleton, John's Prince Albert, Dickson's Trip to Cambridge, Ely's Grace Darling, Brinklow's Purple Perfection, Barnard's Mrs. Barnard, Gun's Queen Victoria, and Kirtland's Princess Royal.*

Pine-apples.—*Prurient.*—We are making inquiries. We believe that the fruit in question was never intended by the grower for exhibition, and if so it is hardly a fit subject for comment. We will, however, keep your letter by us.

Rhubarb Wine.—*Rhubarb.*—We really cannot advise you to make anything so unwholesome as Rhubarb wine. If you will not be wise, then you should proceed with the stalks exactly as if you were making green Gooseberry wine. Some makers of British wines prepare Champagne from Rhubarb stalks, and abominable stuff it is.

Roses.—*R. W.*—There is no danger in removing Roses having a dormant bud inserted about this time. If the Rose shoots freely the dormant bud will do the same, provided it is safely united to the stock. Where buds fail other buds may be inserted on the same branch, and near the same place, but below the old wound.

Seedsmen.—*J. B.*—We really cannot interfere in little disputes between seedsmen and their customers. If we did, our columns would be filled with letters on such subjects. Your remedy is not to deal again with the persons you mention.

Strawberries.—*Ignoramus.*—We have not an idea what has cut off your Elton Pine Strawberries, while green, close to the calyx.

Trees.—*A Subscriber.*—Wood certainly lengthens after being formed; and therefore it is to be supposed that the stem of a forest-tree may increase in length so as to cause any given side-branch to be at a greater distance from the ground each year. We are, however, not aware of any exact observations on the subject.

Wasps.—*W. W. P.*—We know of no means of banishing Wasps, but their nests are easily killed by pouring into them a little oil of turpentine, in the evening, when they have gone to rest, closing over the entrance to the nest with a clod of earth, pressed firm with the heel.

Whitney's Composition.—Various correspondents allege that this renders Calico rotten. The following, from *J. G. H.*, may be taken as a sample of the remainder. "About four months ago I applied the prescribed quantity of Whitney's Composition to glazed calico—4*d.* per yard—stretched on two lights of a Cucumber-frame; for a time it appeared to answer very well, notwithstanding several showers. However, about a month ago I accidentally tore one of the lights, and on examining the rent found that the whole of the calico was quite rotten—in fact becoms mere tinder. If you, or any of your correspondents can tell me whether the calico or the composition is in fault I shall be grateful, as I am about to erect a greenhouse with a stouter material." Perhaps Mr. Whitney or some one else can throw some light on the subject.——*E. J. W.*—It is out of our province to interfere with respect to short quantities. The deficient bottles should have been returned to the seller. Your letter lies at our office.

Miscellaneous.—*A.*—Treat your Pelargoniums all alike. Rose-pruning will appear in the articles on the Rose-garden. ——*North Earle.*—If you will study the articles on Morphology, now almost brought to a close, you will have no difficulty in understanding why your Rose produces a branch in the middle. We cannot name the variety.——*W. D.*—A plant of Cattleya crispa, which is throwing up a spike of flowers, consisting of six buds, is a fine specimen, but we have seen as fine. It is a free bloomer.——*Crassula coccinea* had better be placed out in a warm border against a south wall, until the cold weather comes, and it will probably bloom next season.‡

SEEDLING FLOWERS.

Anagallis.—*G. F.*—When flowers are crushed to pieces in letters their qualities cannot be determined. We see nothing in what remains of your seedling to make it worth distinguishing from its parent.

Carnations.—*E. Derby.*—Your seedling Rose flake is a flower of good form and substance, the petals are of a good shape, but several of them, and especially the guard petals, want smoothness, being too serrated on the edge; the colour is high and fine, and the flake bold and full, and the white is tolerably good; this flower had been too much pulled about, and some of the guard petals taken out. The colour, form, and substance of the flower are fine.*

Fuchsias.—*C. D. M.*—The tube and sepals of your seedling No. 2 are carmine, and the corolla a blood-colour; hence arises that want of contrast pointed out in our late notice; and the greater proportion of the seedlings lately raised have this fault, and too much resemble each other. Your seedling is a large flower, of good form, but it resembles too much varieties in cultivation, and many others that have come under our observation. Self Fuchsias are not now worth keeping, unless of very extraordinary merit.*

Pansies.—*A. N. M.*—It is impossible to judge satisfactorily of your seedling, in the dried state in which it reached us; the colour and marking is similar to many that we have, and it appears to be very small. These flowers require to be packed in something damp.*

Pelargoniums.—*A Berkshire Subscriber.*—Your seedling is common in colour, and the form is not very good, the under petals being too long.*

Petunias.—*W. P.*—Your seedling is similar to a variety noticed last week, excepting that your flower is more decidedly striped, while the one sent by *J. S. S.* was slightly striped and much spotted. Your seedling will be very ornamental as a border variety, if its marking is constant, which we doubt.*

Picotees.—*R. H. M.*—The opinion expressed in a former Number is but little altered from seeing your flowers a second time. The bloom of Enchantress was much larger and finer than the first sent, and our favourable opinion of that variety is increased; but as regards the other flowers our opinion remains the same.*

Pinks.—*J. B. H.*—Your Pink was too far gone to judge of, but the petals appear to be too small, and the edge too serrated for a good flower; the lacing is pretty.*

*** As usual, many communications have been received too late.

SEED-WHEAT.—Any one desirous of purchasing Seed for next year is invited to inspect the two varieties of Wheat, SHIRREFF'S HOPETOUN and MORTON'S RED-STRAW WHITE, 120 acres of which are now growing on WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE.

The present is the only season of the year when the value of any variety of Wheat as Seed can be ascertained by inspection; for, if the examination of a mere sample of the grain, which can be seen at any time, be nearly uninstructive as to its quality in the eye of the baker (see *Ag. Gazette*, No. 5), it is entirely so as to the productiveness or habit of growth of the variety to which it belongs. These points, which are of the highest importance in the eye of the Farmer, can be ascertained only by an examination of the growing plant when in full ear.

JOHN MORTON, Whitfield, Thornbury.

The Agricultural Gazette.

SATURDAY, AUG. 3, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Aug. 7 Agricultural Society of England.
THURSDAY, Aug. 8 Agricultural Imp. Soc. of Ireland.
WEDNESDAY, Aug. 7 } Meetings of the Highland Agricultural
THURSDAY, Aug. 8 } Society at Glasgow.
FRIDAY, Aug. 9 }

WEDNESDAY, Aug. 14 Agricultural Society of England.
WEDNESDAY, Aug. 14 } Meeting at Dublin of the Agricultural
THURSDAY, Aug 15 } Imp. Soc. of Ireland.

ON agricultural subjects, many of which involve interests of such magnitude—where erroneous ideas, when developed in practice, will cause loss, and perhaps ruin—it is of great importance that the terms used in demonstrating opinion, or in communicating experience, should be perfectly understood.

This remark is intended especially to apply to the use of one word often met with in works on drainage, which has certainly a tendency to mislead, and to which we are inclined to attribute much erroneous and uneconomical practice. We often hear of drains *drawing* the water from the soil—of deep drains *drawing* the water from a greater distance than shallow ones. The natural consequence, we think, in the mind of any one in the habit of hearing this word thus applied, is the entertainment of an idea, which first notions on such a subject would probably favour, that a large drain would be more powerfully attractive of any superabundance of water in the soil than a small one. And we are disposed to attribute much of the useless expenditure in the thorough drainage of land by tiles of large size, which is frequently to be met with, to some such idea as this, thus originated. Draining-tiles of a much smaller size than has hitherto been common, are now generally used: experience has ascertained their efficiency.

The fact of the matter is, that, excepting the maximum limit which it places on the flow of water from land—a limit which, in practice, is rarely if ever in action—the size of drains—we mean their sectional area—has nothing to do with their efficiency. When a drain is completed and exists as an inclined tube some 30 inches under ground, to the interior of which water can readily obtain access, the first consequence is that the water in the soil around this tube oozes into it, and whether this drying of the clay, if it be a stiff subsoil, produces cracks, as Mr. Smith contends, or not, it must evidently create a porosity in the neighbourhood of the drain, which did not before exist. The superabundant water in the subsoil near this porous part, thus falls or trickles through it into the drain, and the earth to which it was attached, in its turn losing its impervious character, becomes a vehicle for the passage of water from a still farther distant part of the subsoil.

When drains have once got fully into action, the process of drainage, which commences immediately after rain has fallen in greater quantity than is required simply to *moisten* the earth, is as follows:—Each addition to the water already present in the soil not being attracted by the already moistened earth, trickles or drops downwards wherever there is a way for it, from particle to particle, and unless a previous drought has extended deeper, as soon as it reaches the level of the drain, whether it be in the middle between two drains, or at the very side of one, there it will stop. The idea is obviously absurd that drains can afford an opportunity for water escaping from any part of the subsoil which is below them. And it is equally impossible to suppose that when they are once in full action, stagnant water will be found in any part of the subsoil much above their level in land which has not been artificially puddled in any way; for, supposing the water whose course we are tracing to have fallen in the very centre between two drains, as far from them as possible, yet as soon as so much more should come as would raise it above the level of the neighbouring subsoil, which was dry, it would trickle away to one side, and so ultimately reach the drain. Given, the porosity of a medium of any kind, and the degree of its molecular attraction for water, to find the least angle of a plane down which water would trickle through it, is a problem capable of solution; and it is upon the data of such a problem that the efficiency of drains, though dug at wide intervals, depends. If, in the case of drains 2 feet deep, water being stagnant at 2 feet below the surface over the drain, is, in consequence of the angle of inclination of the plane to which we are alluding, to be found 15 inches only below the surface at a distance of 12 feet, then the efficiency of the drain would cease at a distance of 24 feet from it; for supposing the character of the soil to remain the same, water would at that distance be found stagnant within 6 inches of the surface: it would in fact be stagnant in the active soil.

It is on this principle that the greater efficiency of deep drains is explained, for in their case this same plane of inclination, down which water will consent to trickle through such a medium, commencing as it would at a lower level, would extend a greater distance on either side, before coming so near the surface as to be injurious.

On the use of the subsoil plough as a means of diminishing the angle of inclination of this plane, and so increasing the efficiency of drains, we shall speak hereafter. Our remarks at present are confined to an exposition of the inaccuracy and injurious tendency of the terms often used in explaining the efficiency of drains. Drains do not *draw* or attract water. They simply receive that which naturally trickles down to them. If of size sufficient to carry it off as fast as it arrives, well—if of greater size than sufficient so to act, an unnecessary expense has evidently been incurred in making them so large—if of a size insufficient thus to act, they will take as much as they can, the rest accumulating in the soil till a drier season, when it will be ultimately removed; but the injury done by this accumulation of stagnant water for so long a time, will soon prove that the policy of the proprietor, or whoever it was that had this inefficient but cheap drainage executed, though it may have been penny-wise, was pound-foolish.

THE CHANNEL ISLANDS.

[THE following observations were made by Colonel Le Couteur, on this subject, at the great dinner of the English Agricultural Society at Southampton.]

The islanders are either farmers, sailors, or soldiers. Enjoying a delightful climate, a rich soil, an inexhaustible supply of manure from their rock-bound shore; blessed with mild laws, liberty of the subject, a free press, an extended commerce—privileges which Englishmen dearly cherish—the people have attained a degree of wealth and contentment almost unequalled.

These advantages have not been unworthily gained. Descendants of that ancient Norman race who visited England with William the Conqueror, they have ever since continued connected with the Crown of England. King John granted them a jury and their charter some years previous to signing Magna Charta. On eleven occasions they have successfully resisted invasions from France, and on every such occasion the Sovereigns of England have granted them some new privilege.

Among other institutions connected with these islands, an Agricultural Society has been of great benefit. It has been formed on the same basis as this Society, viz., on a total exclusion of all politics from its meetings and proceedings; and a like result has attended its progress—entire harmony among its members, and a friendly rivalry for good.

The improvement of Wheat for seed, and the general cultivation of crops, have been among the objects of its attention; but the chief one has been to improve the admirable breed of cattle—admirable for the production of large quantities of rich and yellow butter. The chief defect was in the falling off of the hind-quarters; it has taken nine years of close attention to remedy this defect, and as I have personally kept a record of its progress of improvement, I would urge upon young farmers who seek to improve their stock, not to expect success in less than such a period; at the same time, roundness of barrel, a better handling, and a tendency to fatten, when dried off from milk, were points which had been gained without injury to the milking qualities. The cream of the cows of the Channel Islands was so rich and yellow, that in dairy farms where creamer's milk is sold, one such good cow to every three or four ordinary English cows, would be found useful to impart richness to the cream or butter.

With reference to the highly-instructive and interesting speech of Doctor Buckland on Wednesday, Colonel Le Couteur said, the learned Professor seemed to think that a considerable part, if not all the value of guano, evaporated in one season. He was intrusted, two years since, by the Agricultural Society of Jersey, to carry out some experiments with guano—that season was equally dry with this one—and the effects of this manure was imperceptible on either Wheat, Barley, or Grass; but this year the crop of Grass where the guano had been placed, was so rich and succulent, that the scythe could scarcely be drawn through it. Hence it would appear that it may not be quite so evanescent as is supposed; and it is useful in dry weather diluted with water, and thus applied to plants. Its effects will be found surprising in field or garden.

REMARKS ON DRAINAGE.

I CAN hardly divest myself of the idea that you must have been quizzing the Debenham Farmer's Club when you published the report of their meeting of 28th June last, as it is hardly conceivable that men who have evinced so much anxiety for improvement as to have instituted a club for discussing agricultural improvements, should, after all that has been said and written on the subject, talk seriously about making drains with straw: indeed, the whole report is so extraordinary as to court remark. In the first place, all the speakers agreed that the drains should run obliquely across the field. Now this, as a general proposition, has been shown to be perfectly erroneous. Vide Stephens' "Book of the Farm," pp. 537 to 542; Thomson, in "Prize Essays of the Highland and Agricultural Society," vol. xiii. p. 295; and Smith's (Deanston) "Remarks on Thorough Draining," p. 9, where he says—"Drains drawn across a steep cut the strata or layers of subsoil transversely, and as the stratification generally lies in sheets at an angle to the surface, the water passing in or between the strata, immediately below the bottom of one drain, nearly comes to the surface before reaching the next lower drain. But as water seeks the lowest level in all directions, if the strata be cut longitudinally by a drain directed down the steep, the bottom of which cuts each stratum at the same distance from the surface, the water will flow into the drain at the intersecting point of each sheet or layer on a level with the bottom of the drain, leaving one uniform depth of dry soil." It would have been fortunate if the speakers at the Debenham Farmers' Club had stated their reasons for preferring the oblique direction, which is so much at variance with what may now be termed an axiom in thorough-draining. In the second place, with regard to filling the drains with straw, a material of such a very perishable nature must certainly be very improper for filling drains where every requisite for its speedy decomposition exists; let us hear what an eminent agricultural writer says on this subject. "It could," says he, "only be dire necessity that would induce any man to fill drains with straw twisted into ropes;" and again—"Only conceive what a mess such a drain must be that is filled up to the height of 8 or 10 inches either with brushwood stripped of the leaves—Oak, Ash, or Willow twigs being the best—and covered with long Wheat-straw twisted into bands."—*Book of the Farm*, vol. i., p. 607. Now, although I agree most cordially with the resolution that the landlords ought to furnish the tiles, and am satisfied that landlords who are fully alive to their own interests ought not only to do so, but see that the drains are executed in a permanent and substantial manner; still, if it can be shown that tile drains can be put in for nearly the same price as those of straw, there will be no excuse for the tenant (even if his landlord objects to assist him when asked) using the latter. Making an approximate calculation then, say that there are 68 roods of drains (6 yards to the rood) in an imperial acre, when 28 feet apart, the cutting and filling for the straw drain must cost at least 1*d.* per rood more than for tile, as the former requires to be deeper, and the filling is much more difficult and troublesome (see report in question); the straw required cannot be less than 2 imperial stones per rood, perhaps more, which, at the price of 2*d.* per imperial stone, or 26*s.* 8*d.* per ton, will make the account stand thus:—

	£	s.	d.
Cutting and filling 68 roods drains, at 4*d.*	1	2	8
136 stones straw, at 2*d.*	1	2	8
If twisted, the expense must be added—	£2	5	4
	s.	d.	
Cutting and filling 68 roods drains, at 3*d.*	17	0	
980, 15-inch tiles, at 20*s.* per 1000	19	7	
980, 15-inch soles, at 10*s.* ,,	9	9½	
8 stones straw, at 2*d.*	1	4	2 7 8½
Leaving in favour of straw per acre only—	£0	2	4½

But I believe Ethridge's drain-pipes can be had much cheaper than 30*s.* per 1000, which would turn the balance in favour of tiles. Both of the estimates are exclusive of carriage, which would, no doubt, be greatest in the case of tiles; but as there are seasons when horses are comparatively idle on most farms, they might be employed at a trifling expense drawing the tiles (which, after all, are only three single horse-loads per acre) to a convenient place near to where they are to be used.

The most absurd part of the whole report is one individual gravely stating that he uses "plashings of ditches and borders," *i. e.* brambles and weeds, to fill the drains. Fancy a man growing weeds to such an amount on the borders of his fields as to thorough-drain his farm with them! What is the Royal Agricultural Society of England about? Where is Debenham? It was fortunate that the true interpretation of "plashings" happened to occur to me, or it might have been mistaken for the mud taken out of the ditches in cleaning them.—*John Girdwood, Featherhall, Mid-Lothian.*

ON THE FAILURE OF THE RED CLOVER CROP.

THE Red Clover in this village has failed this year to a very remarkable extent. The fact had attracted my attention, and upon inquiry I find the farmers at a loss to account satisfactorily for the circumstance. Some say it is owing to grubs, or insects, which have destroyed the plant; some suppose the land has become tired (as they express it) of growing Clover. They think our land here (which is the bed called blue-drift, by geologists) requires generally a longer rest than eight years, which is the more usual period that elapses before introducing this crop again in the regular four-course shift. All seem to agree that Red Clover is now-a-days much more liable to fail than it used to be some 10 or 20 years ago. The matter is really very serious; and the fact appears to me so curious, in a physiological point of view, that I shall invite a little co-operation from different quarters, in hopes that we may see whether we can ascertain the real cause to which the mischief may be ascribed. How

I wish some prominent leader of the agricultural body could have been found before now, sufficiently confiding in the judgment of those eminent men of science, whose names I paraded last year as approvers of experimental co-operation on an extensive plan! This question of the failure in the Clover-crop is one of the infinite number that might be taken up by an organised band of experimentalists, who would probably settle it in a shorter period by some years, than may possibly elapse before it shall have been satisfactorily determined.

I shall venture to set before the readers of the *Agricultural Gazette* an account of a very restricted inquiry which I have been making into the circumstances under which the Clover has been usually cultivated in this parish. I shall even be bold enough to hazard a *conjecture* on the cause to which the frequent failure of this crop may be ascribed; and then I shall suggest a very simple method of experimenting, by which persons who may think this conjecture worth testing can assist in confirming or refuting it. In order to condense within a narrow compass a review of the various treatment to which seven different fields have been subjected by one or other of four of our farmers, I shall present their own accounts, under a tabular form. The abbreviations made use of consist merely of the first letter or two of the words signified. As the objects under culture, and their introduction in the rotation, is perfectly familiar to all practical men, they will have no difficulty in comprehending the table at a glance of the eye. It represents the modifications of the four-course system in the seven fields A, B, C, &c. Wheat and Barley are the staple crops, which return in regular rotation every four years; the subordinate crops vary. The figures 1 and 2 placed against each year represent the first and second half of the year. The following abbreviations are employed:—

Ba. Barley.	Ta. Tares.	d. drained.
Be. Beans.	Tr. Trefoil.	f. fed.
Cl. Clover (Red).	Tu. Turnips.	m. manured.

In all cases the Clover was looking remarkably fine at the time when the Barley was cut, and (except on G) it began to go off, generally about October, and has continued dying till now, July 27th. The following observations were made on the different fields:—

A. The Clover began to die in patches in October, on that half of the field which had been manured, until it has become nearly bare. The portion of the field which received no manure is looking very fairly, with scarcely any patches of failure, except a large one where the haulm had been collected for the purposes of draining.

B. The failure not so complete as in A.

C. The Clover was most luxuriant, and some had even seeded when the Barley was cut. It began to die away in three days afterwards, and was soon so unpromising, that it was ploughed up.

D. Rooks appeared to settle on certain parts of the field before it had been observed that the Clover was dying: and it was supposed that they were attracted by grubs. The owner of this field had other Clover on lands which had not grown Tares. Some of these fields failed, and others did not.

E. The Clover here has nearly all perished, except one line across the field, which, on inquiry, I found was directly over a main drain.

F. The Clover on that part of the field which had grown the Mangold, was on the whole better than on that part which had grown the Turnips; and the crop much better than on E.

G. The success in this field was attributed to the superiority of the land. A field near it belonging to another farmer had a beautiful crop of Clover on it; and there I was told the Barley had been sown *very early* in 1843.

The mode in which the failure at first shows itself, is by the Clover withering in small patches, in various parts of the field. This may begin within three days, or not until one, two, or even six months after the Barley has been cut. The withered patches gradually spread during the whole time the Clover is left upon the ground. Some plants appear to recover, but in general the evil continues to increase till nearly all are dead, over considerable spaces of the field. I was shown single individuals of a milk-white maggot in the crown of many of the decaying and dead plants. This was, apparently, the larva of some beetle. Without pretending to any skill in Entomology, I feel pretty confident that this larva was not the real cause of the mischief. I had rather, however, leave that part of the inquiry to professed Entomologists, contenting myself with the observation that where such a very extensive failure has taken place, it seems hardly likely that a stray field, here and there, should have entirely escaped the ravages of these insects, whilst those in the immediate neighbourhood were suffering so severely. There are circumstances in the case which incline me to suspect that possibly the parent insect lays its eggs only, or chiefly, in those plants which have already shown symptoms of decay. But I speak here with the greatest hesitation.

A favourite theory, which involves a peculiar definition of the word "tired," is the supposition that the land where these failures occur may have been deprived, some eight or ten or more years ago, of a certain hitherto unascertained mineral substance, more especially essential to the healthy development of the Clover crop. Tired, in this sense, does not exactly mean that the land has been overcropped, or too much exhausted, for the general purposes of cultivation; it merely means that a homœopathic dose of this hitherto unknown "something" has been abstracted; and, consequently, that whenever the refinements of chemical research shall have ascertained what this "something" really is, there will be no further dread of the failure of a Clover crop. This "something" will be required in such small proportion, that nothing will be easier than to restore the "tired" earth to its pristine vigour, and fit it for bearing as much Clover as Atlas may feel disposed to allow us to lay upon it. Now, I do not mean flatly to deny the correctness of this favourite theory; but until this unknown "something" shall have been detected, and thus the theory have become firmly established, I shall not hesitate to oppose conjecture to conjecture, and to venture a suggestion, that the frequent failure of our Clover crops may be attributed to a physiological, rather than to a chemical or an entomological cause.

Under what circumstances is Clover usually cultivated? In every instance, so I am assured, it is sown on land which is simultaneously occupied by Barley, or by some other white crop. Therefore, during the early stages of its growth, and up to the time when the white crop is cut, the Clover is not developing under conditions which a nursery gardener, or even a botanical physiologist, would consider to be otherwise than injurious to the constitution of the plant. It is shaded and sheltered by the Barley, too much for the direct light of the sun to have such full influence upon its leaves as may stimulate them to the preparation of a full proportion of the "proper juice" essential to the perfectly healthy condition of the plant. I find the Barley-stubble is sometimes left lengthy, in order to nurse the Clover, *i. e.*, to protect it from the evils consequent on a too sudden exposure to a hardier condition of life than that to which it had previously been accustomed. Experience, no doubt, has suggested the propriety of this step; but that very experience points to the primary cause (as I conjecture) of the frequent failures in this crop. The Clover has been living under a vicious system of education, and when the protection of the fostering Barley is removed, finds itself (like some over-fondled youth when he gets to Cambridge) unequal to cope with a world of evil influences to which it is now so suddenly exposed. After the Barley has been cut, there may be a variety of circumstances, more or less contributing on the one hand to restore it to a healthy state; or more or less conducing, on the other, to increase the debility of its weakened constitution, and ultimately to bring it to an untimely end. Very slight differences in the soils of different fields, or even in different parts of the same field, may have most marked effects upon plants thus circumstanced. Local differences in the Barley crop may also be among the inducing causes to a variety of results. Variations in season must be ranked among the causes which are likely to operate advantageously, or otherwise, upon Clovers growing on different soils. Another consideration presents itself to my mind, upon a review of the circumstances under which I am told those Clovers are pretty generally cultivated which are expressly intended for seed. They are either fed off in May or else they are then cut, in order that the seed may be produced from fresh shoots; experience having proved that the "virgin seed," as it is called, obtained from the first shoots, is worthless. That seed procured from plants cultivated under circumstances so disadvantageous to the formation of an adequate supply of "proper juice" should be worthless, will not appear at all wonderful to botanical physiologists. Their theory of vegetable nutrition may readily incline them also to admit, that the seed may be good which is obtained from the fresh shoots, supplied as they now will be by proper juice, which has been elaborated under somewhat improved conditions, and also concentrated, as it were (by this abstraction of the first shoots), for the use of those stems which themselves are now developing their leaves under the very best conditions required for the vigorous health of the Clover. But although the seed thus obtained may be good, will it be the very best that could be raised? Let this question also be answered by the test of fair and sufficient experiment. I am inclined to think that seed ripened from plants which may never have been half-choked by the Barley, or afterwards mutilated so late in the year as the month of May, would be more likely to produce a robust stock than seed procured in the usual way. It may possibly have been a work of years gradually to have impressed upon a hardy native stock, like Clover and Trefoil, the more tender constitution of an exotic; just as it may require the pinching of more than one generation of our sturdy peasantry, to reduce them to such dastard degradation as befits only the policy of a despotic sovereign. But peculiar management will in time work wonders in changing natures (vegetable as well as animal) from good to evil, as well as from evil to good.

The day is passed when the agricultural body were unanimous, or very nearly so, in sneering at our sciences, because we asserted we could tell them more about the "laws of nature," and the "reasons for their practices" than they knew themselves. Therefore it is that I now venture once more to direct attention to the propriety of a little co-operation in the attempt to verify a suggestion supplied by a slight acquaintance with the principles of physiological botany. I am not at all trespassing as I did last year, perhaps rather injudiciously, upon the province of the chemist. I now find that I should have spared myself the trouble of inviting the farmers of Suffolk to try our gypsum experiment, if Boussingault had only published his work some 18 months ago. It seems that he has made such advances towards a full determination of the *modus operandi* of gypsum, both *directly* upon leguminose plants, and *indirectly* in the fixation and liberation of ammonia under the forms of two salts useful to vegetation, that my little humble experiment is not very likely to be of much service in the cause; still it will be a pity not to carry it out fairly, now that it is so much advanced—and even yet it may possibly not be without its uses.

The inquiry I now suggest is, whether the Clover of 1844 may not be a more tender stock than is advisable for the description of culture to which it is subjected by our farmers; and whether we can contrive, by growing seed apart from those crops which are intended for fodder, to produce a better race of plant? Let those who sow Clover next spring leave a stetch or two in the middle of their fields, without any intermixture of Barley or anything else. They will thus have an opportunity of seeing whether such unsheltered Clover behaves itself like the rest, and whether the seed it shall produce (without the plant having been touched by tooth or scythe) may not the following year give birth to a somewhat sturdier race. If it should ever be proved to the satisfaction of all farmers, that a more careful attention to the seed-crops destined for future culture is an important step in the progress of agriculture, then, perhaps, we may see a suggestion followed out, and which has long been a favourite notion of my own also, that it would be advisable to encourage the labourers of every parish to direct their aim, in a special manner, to the growing of certain crops for seed upon those allotments, which we may hope before long will be more generally provided for them throughout the country.—*J. S. Henslow, Hitcham, July* 29, 1844.

HISTORY AND CULTIVATION OF WHEAT.

There are two sorts of Wheat cultivated in this country—Triticum hybernum, or winter Wheat, and T. æstivum, or spring Wheat.

There are many varieties of both these kinds of Wheat in cultivation. The white sorts are generally esteemed the best—the red varieties having a thicker and rougher husk, a hardier nature, and being better adapted for cold climates; but they are less productive, and yield an inferior flour to the white.

The Spring Wheat is less hardy than the winter variety, and in our uncertain climate is seldom cultivated, except in some of the more southern counties. The grain is smaller and less productive than winter Wheat. The only advantage it possesses is the security which it offers against the injurious effects of a cold and rainy spring; so that in situations where winter Wheat has failed, it can be sown as a substitute. It is the practice of some farmers, when the winter Wheat has gone off in patches, or appears thin, to rake in spring Wheat into the vacant places; by this means, if the operation be performed early enough, the uniformity of the crop is restored, for the spring-sown Wheat will arrive at maturity as soon as the winter-sown.

When spring Wheat is intended to be sown by itself, it should not be delayed beyond the end of March; from which time till its maturity, the farmer has little to dread from severe weather. Sir Humphry Davy, in his valuable work on "Agricultural Chemistry," says the nutritive parts of spring Wheat are not quite equal in quantity to those of winter Wheat, being 95½ per cent. in the latter, and only 94 per cent. in the former, of the entire bulk of the grain: the gluten varies in a greater degree; that of winter Wheat being 24, while spring Wheat is only 19 per cent.

Winter Wheat is generally committed to the ground in October or November in England, on a Clover lea, with one ploughing, or on a well-wrought summer fallow. The land should be well wrought, clean, and well manured; this being accomplished, it is of little import-

ance whether the grain is sown broadcast or in drills; three courses of harrowing is sufficient to cover the seed, the water furrows being drawn immediately, and cuts opened to carry off the surface-water to the ditches at the end of the fields. The soil on which Wheat thrives best in our uncertain climate, is a strong rich clay. The quantity of seed which is generally sown, varies on most farms according to the quality of the seed and richness of the land. There are many conflicting opinions amongst farmers as regards the depth that the seed should be sown; some are advocates for shallow, and some for deep: in our opinion three or four inches is amply sufficient. The farmers of warmer climates are obliged to irrigate their Wheat lands during the growth of the plant. In the greater part of the temperate regions of New Spain, the farmers are compelled to adopt artificial irrigation. This is done by small canals cut through the farm, and supplied with water from the rivers and reservoirs, which can be let loose over any part or all the farm at one time, in those districts where irrigation is regularly adopted. The produce of the Mexican farms is far beyond what the richest soils of Europe could produce, the Wheat harvest being commonly 35 and 40 seeds, and some of the larger farms yielding 50 and 60 measures for one of seed. When the land is not irrigated, the annual return does not exceed more than 15 or 20 seeds.

The Wheat chiefly cultivated in Egypt and some parts of Italy is the Triticum compositum, Egyptian or many-spiked Wheat. This species is supposed to be indigenous to Africa, its stem are branched, and each bears several spikelets or ears, which are bearded; the grains are thinner and less nutritive than our ordinary varieties. This species endures, without injury, the extremes of heat and moisture, so that it is well adapted to those countries in which it is generally cultivated. Triticum Spelta, or Spelt Wheat, is supposed to have been the species cultivated by the Romans; it is cultivated to a considerable extent in the North of Africa and the Cape of Good Hope; in Spain, where it is given to horses instead of Barley or Oats; in Germany, Switzerland, the South of France, and in some parts of Ireland. There are two varieties of Spelt Wheat, one with awns and the other without them; it is generally sown as a spring crop, and grows luxuriantly; bread made from it is of a dry quality and less nutritive than the ordinary kind. In some parts of Switzerland the Triticum monococcum, or one-seeded Wheat, is cultivated; this species contains less gluten than the common varieties, and is very diminutive, the spike containing only a single row of grains; it is mostly used in soups and gruels; the straw, from its hardness and tenacity, is well adapted for thatching, for which purpose it is generally used.

We are of opinion that Wheat would flourish better if it were buried deeper than it generally is by most farmers. Our opinion is founded upon the following facts:—A grain of Wheat, when buried to the depth of three inches, undergoes the following transformations:—As soon as the farinaceous matter of the seed is softened, a germ is pushed out, and at the bottom of that germ small roots soon appear; these roots gather strength, whilst the germ, fed on the milky-fluid of the softened seed, is springing upwards. When this substance is exhausted the roots are in activity, and are collecting food for the young plant from the soil; when the germ has fairly got above the surface of the ground, and becomes a plant, a set of fresh roots are thrown out close to the surface of the ground, which search for food with the same activity as the under ones search the lower parts, and that part of the germ which separates the two sets of roots, now becomes the channel through which the lower roots supply the plant with the food which they have collected. These two distinct sets of roots serve to fix the plant firmly in the soil, and to collect nourishment from every quarter. The upper roots are situated so as to receive all nourishment which comes naturally from the atmosphere, or artificially, as manure to the surface, and serve the important purpose of being the bases of new stems, which are tillered up, and greatly increase the productiveness of the plant.

Wheat that is sowed in autumn, a Clover lea excepted, should, instead of harrowing, be covered with a shallow furrow, and the surface left rough. It will be less in danger of being killed by severe frost in winter, and less injured by drying winds in the following spring. The furrows should be left without harrowing, for the more uneven the ground is, the more the soil will be pulverised and mellowed by the frost. But if the crop which succeeds the Wheat crop should require a smooth bottom, the land, after sowing, must be harrowed, and should be rolled. Some farmers advise, when Wheat is sown on a Clover lea, to plough in the Clover with a deep furrow, then plough in the seed Wheat with a shallow furrow.

In preparing seed Wheat, the first thing to be attended to is to clear it perfectly from every injurious foreign substance; one error here may mar the whole system, and render our skill productive of as much evil as good. On poor and worn-out land, the evil of sowing seeds of weeds with our grain would be great, but when the ground is in high order, the crop is more injured, the noxious plants take firmer hold, and are more difficult to eradicate. Indeed, it would be better for a farmer to make a riddle of his fingers than to sow Cockle, Darnel, Tares, and other vegetable nuisances, which are as tenacious of life as they are unworthy of it; the first preparation, therefore, should be to winnow and riddle the grain perfectly clean. When this is thoroughly accomplished, washing and steeping, for the purpose of preventing smut, should meet attention.

Wheat is exposed to a disease called smut, the real nature and cause of which have hitherto baffled the researches of our most scientific inquirers, and the cure has completely baffled all the attempts of our best agriculturists. It prevails more in wet climates than dry; white Wheat is more affected by it than red; and Wheat sown in spring is not so liable to be diseased as that sown in autumn. Sir J. Sinclair enumerates the following modes by which smut may be prevented:—1, the use of pure cold water and lime; 2, boiling water and lime; 3, water impregnated with salt; 4, urine pickle; 5, ley of wood-ashes; 6, a solution of arsenic; 7, a solution of blue vitriol. Mr. Arthur Young sowed 14 beds with the same Wheat seed, which was black with smut. The first bed was sown with this Wheat without washing, and had 377 smutty kernels. A bed sowed with seed washed in clean water produced 325 do.—washed in lime-water, 43 do.—washed in ley of wood-ashes, 31 do.—steeped in lime-water four hours, 2 do.—steeped in ley four hours, 3 do.—steeped in arsenic four hours, 1do. Again, that which was steeped in ley, as before mentioned, 12 hours, had none; and that which was steeped in the same kind of ley 24 hours, had none; that also which was steeped 24 hours in lime-water, had none; that steeped in arsenic 24 hours, had 5.

Wheat is subject to another disease, called rust or mildew. Common Wheat is more subject to this disease than bearded Wheat, especially if the land has been newly manured with too great a quantity of fresh dung; it generally commences in July, at the time of the filling of the kernel in the ear. The remedies against rust, according to Sir J. Sinclair, are as follows:—1, Cultivating hardy sorts of Wheat; 2, early sowing; 3, raising early varieties; 4, thick sowing; 5, changes of seed; 6, consolidating the soil; 7, using saline manures; 8, improving the course of crops; 9, extirpating all plants that are receptacles of rust; 10, protecting the Wheat-plants by Rye, Tares, and other crops. The above remedies are enlarged upon by Sir J. Sinclair in "The Code of Agriculture," but his observations are too voluminous to quote here. If a field be evidently affected with rust, and the progress of vegetation stopped, the only way to preserve the straw and the grain, if any has been formed, from being entirely lost, is to cut it down immediately, even though the crop should not be ripe. The straw is thus preserved, either for food or litter, and it is maintained that any nourishment in the stem will pass into and feed the grain, and make a greater return than could be expected. For a more elaborate account of the diseases of Wheat, we refer our readers to the "Quarterly Journal of Agriculture" for June, 1837.

One of the most destructive insects to which Wheat is exposed is the Corn-weevil (Curculio granarius). This insect is a beetle about the eighth of an inch in length, of a blackish-brown colour. The female, by means of her long proboscis, perforates a small hole in a grain of Wheat, and in this she deposits a single egg. In about a week after being deposited the eggs hatch, and the grubs continue to live inside for some time, devouring meanwhile the farinaceous parts of the grain. When they have fed, and grown to their full size, they transform into a chrysalis inside the husk, which they quit about a fortnight afterwards, when they have transformed into their beetle state. Kirby and Spence calculate that a single pair of weevils may produce in one season 6000 descendants.

To rid a granary of these destructive insects, it has been recommended to farmers to spread their Corn in the sun, when they will creep out of their holes; and by often stirring the Corn whilst in this situation, it is supposed that they may be completely expelled. It is also said that they may be destroyed by strewing boughs of Elder or branches of Henbane among the Corn. Some recommend the use of Tobacco, either green or in rolls, as a preventive against weevils; they will come to the Tobacco from all parts, and, having eaten of it, certainly die. And the Rev. F. W. Hope says that it is a common practice in some parts of Spain to expose the Corn to a heat of 150 degrees, or more, for the purpose of destroying these insects.

Ice-houses have been recommended to be used as granaries, and there can be but little doubt that, if the grain is surrounded with ice, it would escape the attacks of all insects. If there were any grubs or weevils in the grain when put into these ice granaries, they would die.—*John M'Intosh.* [This idea could, however, be carried into practice in but few climates where Wheat is grown.]

ON THE APPLICATION OF MANURES.

(*Continued from page* 511.)

"We know," says Liebig, "that the functions of the leaves and other green parts of plants are to absorb carbonic acid, and with the aid of light and moisture to appropriate its carbon." "The verdant plants of warm climates are very often such as obtain from the soil only a point of attachment, and are not dependent on it for their growth." "Large forests are often found growing on soils absolutely destitute of carbonaceous matter; and the extensive prairies of the western Continent show that the carbon necessary for the sustenance of a plant may be entirely extracted from the atmosphere." Indeed, from the moment the leaves are formed he attributes to them the power of supplying the plant with the requisite nourishment from organic matters; that is, the products of animal and vegetable decomposition. He says, "When a plant is quite matured, and when the organs (the leaves), by which it obtains food from the atmosphere, are formed, the carbonic acid of the soil is no further required." This, however, infers, that till then the carbonic acid of the soil is required; and, indeed, he says, "In spring, when these organs (the leaves) of plants are absent which nature has appointed for the assumption of nourishment from the atmosphere, the component substance of the seeds is exclusively employed in the formation of the roots. Each new radicle fibril which a plant acquires may be regarded as constituting at the same time a mouth, a lung, and a stomach. The roots perform the functions of the leaves; from the first moment of their formation they extract from the soil their proper nutriment, namely, carbonic acid generated by the humus." But I do not see that he produces any proof of this; it appears rather a concession to the long-standing prejudice, that plants receive their alimentary juices from the soil alone, in every stage of their existence, giving to the leaves merely an elaborating power governed by a vital principle; this vital principle, however, is discarded by Liebig. Nor can I admit, with Liebig, that even from the first it is necessary that carbon should be extracted from the soil by the roots, for grain will vegetate in distilled water; and with some appearance of contradiction Liebig himself says, "That the component substance of the seeds is exclusively employed in the formation of the roots;" and with moisture this component substance of the seeds appears to me to be sufficient. In a report made some few years ago by Drs. Thomson, Hope, and Coventry, to the Excise Board of Scotland, we find it stated, that in malting Barley (for the purpose of making spirits or brewing), about a day after the sprouting of the roots, the rudiments of the future stem may be seen to lengthen. It rises from the same extremity with the root, and advancing within the husk, at last issues from the opposite end of the seed, and assumes (but this is prevented) the form of a blade of Grass. As the plumule shoots along the grain, the appearance of the kernel, or mealy part of the corn, undergoes a considerable change and becomes sweet, (that is, the starch is transformed into sugar). It is the common opinion of maltsters that this change of the grain always keeps pace with the plumule—the young leaf, be it observed—each seed being altered as far as the point of the plumule extends, and no further. It does not appear that a plant ever seeks a supply of nutriment from the soil; it rather appears to avoid the locality where it is to be met with, and to push its roots beyond its influence. If with a very little care we take the earth from a Turnip-plant just attaining its rough leaf, and where manure of the most volatile nature is used, the least likely to descend into the ground—say guano—we shall find the stronger and coarser fibres of the roots have pushed down 5 or 6 inches; the finer fibres might be traced, with greater care, much deeper. It cannot be for a moment supposed that the guano could have penetrated so soon to such a depth; the roots have not then gone in quest of the alimentary juices, which manure could afford. The lateral branches of the roots of a tree or plant may stretch for some distance near the surface, and in the parts where the richer vegetable mould exists, induced probably by the moisture generated by decomposing matters; but their ends, the recipient parts of the roots, tend downwards, as do all the fibrils of these root-branches. This has by some been attributed to gravity; but as the stem above the ground exceeds in gravity the root below it, the same rule should hold good with more force to bring it under the soil. If to mere gravitation we are to attribute the descent of some roots, why do not roots subject to the action of running water submit to the same rule, but that they find that which they seek nearer at hand? For the formation of the root, carbon does not appear to have been acquired from any other source than the seed in the malting process of Dr. Thomson, &c. Liebig says the roots perform the functions of the leaves, but they are supplied with their nourishment in the first stages of their existence by the seed; and this I would rather say performs the functions of the leaves to them till the leaves are formed; it is the seminal leaf which feeds the root. From the moment the plumule shoots, it provides for itself by the absorption of carbonic acid from the air in the artificial growth (the formation of malt), and from the soil in the natural growth; its power of so doing and its production are simultaneous. We can fix no other period for its acquiring this power; from the moment it shoots it begins to exert this power; and if the root is broken off, by it a new formation is commenced. Drs. Thomson, &c. say, "Many of them (the roots) are broken off during the turning of the malt; and, in that case, new roots generally succeed them. That all substances in solution in a soil are absorbed by the roots with the water in which they are in solution cannot be denied; but I think the presumption is against organic matters thus presenting themselves. The leaves of plants are equally, in all probability, without the power of refusing that which presents itself to them in solution in the gases they take in. The leaves and roots of plants may perhaps occasionally perform the functions of each other, as the pores of the skin in an animal may be made inlets of food when it cannot be received by the gullet; but I believe the office of the root is solely to supply the plant with moisture, that of the leaf with those gases which, together with moisture necessary to all chemical action, become the food of plants.—*Lieut. J. M. Goodiffe, Revenue Police, Granard, Ireland.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

(Tillage Operation, *continued*).

The ploughing of the stubble land to be green-cropped the following year, commences immediately after the labours of the harvest, and the sowing of Wheat after summer fallow and Beans and Potatoes harvest are concluded. It is

begun, not unfrequently, even before the completion of Wheat sowing, as the state of the weather and other circumstances may render convenient or necessary. The stiffest and wettest fields are always ploughed first, for the purpose of allowing the soil to derive the full benefit from its exposure to the effects of frost and other atmospheric changes during winter. Frost, in particular, exercises a very powerful influence in meliorating strong adhesive soils.

The general mode of ploughing stubble land is by casting the ridges in the manner already described. The feirings are now made in the open furrows; those in which feirings had been previously made becoming open ones. The ridges are thus ploughed in a direction contrary to that in which they had been last done, the furrow-slices being reversed.

Sometimes when the land is very wet and tenacious, the ridges are cloven, feiring being made in every furrow. All the furrows are kept clear for the purpose of preserving the land in a dry condition during the winter. Immediately after the ploughing of the ridges is completed, whether the field has been in Grass or in Stubble, the headlands upon which the horses turned are ploughed: they are usually of the same breadth as the ordinary ridges. In many instances a ridge is left unploughed at either side of the field, to be ploughed with the headlands, as one continuous ridge round the field. When this is not done, the headlands are generally cloven when broken up from lea, and gathered when next ploughed from stubble.

It may be proper to observe here, that the system of crown-and-furrow ploughing, although the most expeditious, is generally disapproved of, and is, therefore, but seldom practised in this county. In heavy land which has not been thoroughly drained, and in which a considerable degree of curvature is usually given to the ridges, this method of ploughing is, for obvious reasons, altogether inadmissible. Even in light dry soils crown-and-furrow ploughing has latterly fallen into disuse, because necessarily occasioning as many open furrows as there are ridges—a defect which is obviated, to a great extent, by the practice of casting the ridges.

Cross Ploughing.—In the usual management of the farm, the first operations performed in the spring are the sowing of spring Wheat, Beans, Oats, and Barley; after which the land to be that year in green crops receives a second furrow, beginning with those parts which are intended for Potatoes and Swedish Turnips. This ploughing is sometimes, but not frequently, given in a direction crossing that of the ridges. In dry, friable soils direct cross-ploughing is perhaps to be preferred, as in light, porous land no great danger need be apprehended from wet weather; but where the soil is heavy, and not thoroughly drained, considerable injury is frequently suffered by its being ploughed into large flat ridges crossing the former ones, especially should a long continuance of wet weather ensue. In such circumstances the second furrow is generally given lengthwise, or in the direction of the ridges, especially should the weather happen to be rainy or unsettled at the time. The next ploughing is usually given across; and if any more are rendered necessary from the nature of the crop to be sown, or the condition of the land, they are given in various directions, determined by circumstances. It is injudicious to plough the same land twice consecutively in one direction, if it can be safely avoided. Instead of ploughing directly across the ridges, a diagonal direction is frequently adopted, the inclination to the line of the ridges being regulated by the slope of the field.

The depth to which land is ploughed depends upon the quality of the soil, the nature of the crop, and the operations which are to follow. In ploughing lea, 9 inches wide by 6 in depth are the usual dimensions of the furrow-slice, the common calculation being that the breadth and depth should be nearly in the proportion of three to two. It is deemed injudicious to plough deeper than six inches, or to expose any new soil in ploughing Grass land, particularly old pastures. In giving the first, or winter furrow, to stubble lands, preparatory to green crops, the plough is made to penetrate as deep into the soil as it can be drawn by two horses. From 9 to 12 inches is the usual depth. The first furrow for summer fallow, and for Beans, is generally ploughed something deeper than that for Turnips or other green crops. On well-conducted farms, the stubble land is always ploughed to a considerable depth, in order to expose as much fresh soil as possible—when the subsoil contains nothing noxious to vegetation—to the mellowing influence of the winter's frosts. In the process of preparing the land for green crops, the second, or cross furrow, as it is sometimes termed, is invariably taken as deep as the strength of two horses will accomplish. When it is considered desirable to plough to a greater depth than 12 inches, as in summer fallows, three or four horses, according to the nature of the soil, are yoked together. In the case of such deep ploughing a piece of plate-iron, about 3 inches in height, is sometimes attached to the upper edge of the mould-board, for the purpose of increasing its height, and thereby preventing the earth from falling back into the trench. Shallow-ploughing is invariably practised after Turnips are eaten on the ground by sheep, that the manure may not be buried too deep; and also in covering in lime, because it usually tends to descend of itself into the soil. In ploughing down farm-yard dung—a practice which I have already mentioned as being prevalent on heavy soils in this district—it is not desirable to go any deeper than what is necessary to cover the manure, so that none may be left exposed to the influence of the atmosphere.

The general breadth of ridges is 18 feet, this size being found the most suitable for the several purposes of sowing, harrowing, and reaping. In very dry and light soils, ridges are frequently dispensed with altogether, such land being commonly ploughed into very wide ridges called *flats*, and afterwards marked off into ridges of the ordinary breadth, in order to regulate the sowing and reaping. In some places where the land is of a dry porous nature, ridges are often made 34 and 36 feet wide. There are what are here termed *band-win* ridges, in consequence of being reaped by a band commonly of six reapers attended by one binder. The direction of the ridges, owing to the irregularity of the surface, is very various. As the principal ridges or hills, of which the county is composed, lie in a direction from east to west, the land slopes either to the north or to the south and the ridges accordingly are made to lie in the same direction, by which the Corn at both sides enjoys nearly equal advantages from the influence of the sun. Although the direction of due north and south is, for this reason, to be preferred, when the circumstances permit, yet it is the particular inclination or slope of the field that mainly regulates the direction in which to run the ridges. The practice almost universally observed, is to form them directly up the greatest acclivity of the field, by which the land, particularly such as is of a strong retentive character, is preserved in a comparatively dry condition during winter, or in very wet weather. The operation of ploughing strong clayey soils too, can never be so surely, or so effectually performed as when the land is ploughed directly up the acclivity. When the ascent, however, happens to be very steep, the ridges are frequently formed rather diagonally, with a slight inclination towards the right hand at the top. By this arrangement, in ploughing up the acclivity the furrow-slices fall more readily from the plough, which considerably diminishes the labour of the horses. Another advantage resulting from forming ridges in an oblique direction on such land is, that the surface soil is less liable to be washed down from the higher to the lower ground by heavy rains or currents, while in droughty seasons much more moisture is retained.

It may not be improper to mention in this place, that a kind of plough having two coulters and two mould-boards was much used some time ago in East Lothian, for ploughing across steep declivities, in order that the furrow-slices may be always turned down the hill. By means of a very simple contrivance, one coulter and mould-board was depressed, while the others were elevated, at the end of each furrow, by which all the slices were ploughed to one side. Although a plough of this description was much used in such situations so far back as 30 or 40 years ago, neither it, nor any of the improved turn-wrest ploughs since invented by Mr. Smith of Deanston, and others, is now used, it being considered highly injudicious, if it can be possibly avoided, to plough directly across the declivity. An oblique direction is always preferred, because, by adopting the former practice, the soil is worked down to the bottom, where it speedily accumulates, leaving the top bare and unproductive. In speaking of ridges, I have hitherto supposed them as running through the entire length of the field; but as the land frequently slopes in different directions, and as the fields are, generally speaking, of a large size, it is sometimes expedient to alter the course of the ridges, in order to answer the inequalities of the surface, or to diminish their length for the purpose of lessening the labour of the horses. Accordingly, in very large fields of irregular surface, the ridges take various directions, so as always to have them lie with the greatest declivity, unless when the inclination happens to be very abrupt. The quantity of land ploughed in a day by a pair of horses, depends very much upon the quality of the soil, and the dimensions of the furrow-slices. As the land is for the most part very adhesive and difficult to labour, the motion of the horses is necessarily slow, but even in the strongest soils a pair of stout horses is allowed to be capable of completing in nine hours three roods when the land is in Grass, or about an imperial acre when ploughed from stubble. In very light soils, or when the land is in a loose half-pulverised state, considerably more is often done, but in an average quality of land, a statute acre is the general allowance to a pair of horses in the day.—*T. Sullivan.*

Home Correspondence.

Adulteration of Manures.—I collect from your Paper, as well as from other sources, that great adulteration either takes place, or is suspected, in that valuable manure guano. I observe too that a certain class of chemists and country druggists are desirous to have the job of analysing every bag which is bought and sold. I do not wonder at this: they will make a good thing of it, if they can persuade the farmers to come into the plan; but this they never will do, and the sooner you put an end to this wild notion, and recommend something more practicable, the better it will be for all parties. I will suggest to you a certain remedy for the evil. There are several large houses who import great quantities direct from the countries where it is found; they will, of course, always bring the best article they can find, as the charges and expenses are no more upon the good than they are upon the bad. They are highly respectable people, and may be trusted; but besides this, you have their interest on your side, because it is a great object to them that the trade should increase, which can only be by the increase of consumption consequent on the good effects of the manure. They are sure, therefore, not to adulterate it. Now all the farmer has to do is to write an order direct to the merchant who imports, and he will get the guano from the first hand, at the first price; be quite sure there is no adulteration, and save money by not going to the middle-man, where only the adulteration now so universally complained of takes place. The farmer, however, will have to pay the carriage; and in order to reduce that, let me recommend to him always to purchase the very best quality imported.—*J. G.* [The plan suggested by our correspondent will be a security in a measure against *artificial* adulteration, but not against that (which, however, is not so much to be dreaded) arising from natural causes—the admixture of earthy matter with the manure by wind, for instance, on the islands where it is procured. It is the interest of those who import nitrate of soda and other salts, as much as it is of the importer of guano, to procure a pure article, for it saves them expense of carriage; but we know that the former article as imported is often adulterated to the extent of 10 or 20 per cent. The purchasers of this, however, are not cheated; they judge of the quality of what they buy from an authenticated analysis. Why may not the purchasers of guano have this security also? We reiterate our advice to all purchasers of guano, to require from all venders of it authenticated analyses in this manner, and then "put aside a pound of the substance in a glass bottle, cork it securely, and seal it up, so that it may eventually become evidence against the seller. If crops fail, or suspicion is aroused, have it formally analysed, and then if it turn out to be different from the analysis on the faith of which it was bought, proceed at law against the seller."]

Hybridising Barley.—I have endeavoured to hybridise Alpine Strawberries with Hautbois, and *vice versâ*, but have never succeeded. I have frequently thought that Hordeum pratense might be hybridised by common Barley, and that the result would be a larger grain in the Hordeum pratense. I apprehend that the first operation would not be attended with perfect results, but think that if the hybridised Hordeum pratense were again and again operated upon, by the third season the object might be attained. But this may perhaps be needless, as I think I have read of a Polish or a Russian sort of Barley that is perennial. I have also thought that if the larger grains of Hordeum pratense were selected, a larger grain might be produced; and that, if the largest of these larger grains were selected, the same sort of result as above might be attained. What, however, I chiefly seek for is a Barley of a hardy description, that might stand the winter, and be harvested earlier in the ensuing season. Perhaps some of your ingenious readers may turn this hint to account.—*M. B. G.*

Bark of Trees.—Your correspondent "Clericus, V.," inquires in last *Chronicle* for "a simple means of preventing cows from gnawing the bark of trees." I have suffered from the havoc made by sheep in this respect, and have found a preparation of soot and cowdung a pretty good preventive, the soot being the active agent; but the appearance is unsightly. I mean to try a strong infusion of Socotrine Aloes as the cheapest bitter I know of, and free from the objection to soot on the score of its colour.—*Anon.*

Late Horse-hoeing.—This is, as you say, an important question. We are told, on good authority, that Raspberries, Strawberries, Vines, and indeed all fruits, should not be dug about at all. Am I right in supposing that the seeming contrariety between this advice and yours about Turnips arises thus?—In the case of Turnips, Potatoes, Cabbages, &c., where a large system of leaves or tubers is wanted, the frequent and late digging is beneficial, inasmuch as it encourages vigour of growth in the plant, both leaves and roots; but in the case of fruits you must check the growth sometime or other, or the plant would not blossom, or, at least, there would be comparatively few blooms.—*W. C.*

Selection of Seed.—As the two following examples may prove useful to some of your readers, by impressing on them the necessity of being very careful in procuring seed for the Turnip-crop, I will transcribe them from my note-book, for insertion in your Paper. Not having quite enough Swede-seed to drill the whole of my field, I procured a small quantity from a country seed-shop to complete the job; but when the plants began to come up there was a remarkable difference in the rows where this seed was used. The plants were not only several days later in making their appearance, but came up very irregularly, and did not grow so fast as the others. The seed drilled in the rest of the field was grown last year by a neighbour, and not beaten out till this spring. They were both drilled the same day, with the same manure; thus both having an equal chance. Intending to sow a field that had been pared and burnt, with common Turnips, I procured my seed from the same source as the unsuccessful Swede seed, and prepared to sow very early. Fortunately for me the season was so dry that although the ground was ploughed it was impossible to work it for some weeks. In the meantime a farmer in the neighbourhood harvested some Turnip-seed, and I, thinking to make sure, procured some which I mixed with the rest, at the rate of 1½lbs. per acre of new seed to 2lbs. of old. I sowed five acres out of a six acre field with this mixture, and the plants are now up well and regular, but not at all too thick; in short, there is every prospect of a good crop. It is impossible to tell the age of the seed procured from the shop, though it is evident it did not vegetate to any extent; and had I depended entirely upon it, the crop would have failed. The remaining acre of the field was sown with 3½lbs. of the old seed, which came up so thick, I was obliged to harrow in some new seed. My reason for sowing all old seed on one acre was to have an acre of Tankards, the new being the White Globe. The single acre is in the middle of the field, and the Turnip-plants on each side are in a most flourishing condition.—*Arthur Hall, The Cwm, Chepstow.*

On Shell-fish as Manure.—An article in No. 29, extracted from the *Dumfries Courier*, on the successful results of experiments with shell-fish as manure, induces me to trouble you with a few remarks on the subject. Muscles and star-fish (five fingers, as the farmers call the latter) have long been an established manure in the neighbourhood of Faversham, in Kent. In a little work entitled "Practical Chemistry for Farmers and Landowners," published a few years ago, I adverted to this circumstance, and endeavoured to impress upon the attention of agriculturists residing near the coast, the advantages which they might derive from the use of these as manure, and the benefit they would at the same time confer on the community from the employment which the collection of them would afford to that hardy race of fishermen, which constitutes the nursery of our mercantile and national Navy. In the neighbourhood of Faversham, the muscles and star-fish are procured by dredging, and furnish bread to the free dredgers, who were nearly deprived of employment by the neglect or mismanagement of the oyster grounds belonging to the Corporation, on which they had depended for their subsistence. Muscles sell at 16*s.* the waggon load; "five fingers" at somewhat more—I think 21*s.* The farmers consider the latter the most efficacious manure; the reason of which the chemist would probably find in the greater proportion of phosphoric acid present in their hard covering. I have frequently counted between 12 and 20 waggon loads of one or the other leaving Faversham on a market day. There is scarcely a point of our coast which would not furnish, either by means of dredging, or by means of beds left dry at low water, a valuable source of employment and a valuable mine of manure, which would restore a portion of those supplies of ammonia and the phosphates which our rivers are daily bearing from our sewers into the sea. In the same manner the freshwater muscles, the anodons and unios of our rivers, together with the large paludina, (a shell somewhat resembling in appearance the periwinkle or pin-patch) occasionally occur in sufficient quantities to be worth the attention of those experimenters who may be disposed to offer the unemployed population of the neighbourhood a fair price per bushel for collecting them. That small fish the stickleback has been, if it is not now, collected in large quantities for manure from the ditches of our fens, and I can see no reason why frogs should not be applied to the same purpose. They might be easily killed by sprinkling them with salt, which of itself is, in moderate quantities a valuable manure. We should thus, like the French, eat Frogs, though not exactly in the same form. But to return to the supplies of manure which marine animals are capable of furnishing:—The river Conway in Wales has long been celebrated for its pearls, which are even enumerated among the temptations which induced the Roman invasion of our island. Large pearls are occasionally found in the Unio margaritifera of the freshwater portion of the river, and small seed pearls are obtained in considerable quantities from the edible muscle (Mytilus edulis) of which there are large beds at the mouth of the estuary. The use to which these small pearls are applied, and the channel through which they are disposed of in London, have hitherto remained a secret, and the secret has conferred a monopoly of the traffic on parties who purchase them of the peasantry by the ounce, at such a price as renders the work of collecting them a source of remunerative labour, not only to women and children, but to men. The muscles, when collected, are boiled in large caldrons to cause the opening of the shells, and the mass being stirred and washed, the pearls are found at the bottom of the vessel. The refuse would form a valuable manure, but is, or at least was, a few years ago, left in large heaps on the shore. Perhaps this article, and that which you have extracted from the *Dumfries Courier*, may induce some of your readers residing near Conway, to make trial of it as manure. On stiff soils, the shells alone would be beneficial in some degree, though perhaps of little comparative value in a district where lime is so easily procured; but there can be no doubt that the mixture of the shells and boiled bodies of the animals would be highly efficacious. While we avail ourselves of the aid of commerce from the importation of foreign manures, let us not entirely lose sight of those supplies which lie unheeded at our own doors.—*J. Trimmer.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

In completion of our last week's Report of the Southampton Meeting we have to publish the following correction of Errata in our report of the award of premiums for Live Stock:—

Cattle of the Channel Island Breed.—The prize of 10 sovereigns, in Class 2d, for the best bull calved since the 1st of January, 1843, and more than one year old, was adjudged to Mr. W. Woolcock, of St. Peter's Parish, Hants, for his 1 year 5 months old Jersey bull, bred by Col. Le Couteur, of Belle Vue, Jersey.

Cattle of any Breed or Cross.—The prize of 15 sovereigns, in Class 4th, for the best in-calf heifer, not exceeding 3 years old, was adjudged to his Grace the Duke of Buckingham, for his 2 years 10 months old long-horned heifer.

South Downs.—The second prize of 15 sovereigns, in class 2d, was adjudged to Mr. Grantham, of Stoneham, near Lewes, for his 28 months old South Down ram, bred by himself.

Long-woolled Sheep.—The second prize of 15 sovereigns, in Class 2d, was adjudged to Mr. E. Smith, of Charlbury, near Enstone, Oxon, for his 52 months old Oxfordshire ram, bred by himself.

Pigs.—The second prize of 5 sovereigns, for the second best boar of a small breed, in Class 2nd, was adjudged to Mr. T. M. Goodlake, of Wadley House, near Farringdon, for his 1 year 2 months old boar, of the Wadley breed, bred by himself.

We have also to make the following Addenda with reference to this section of our report:—

Extra Stock.

Beasts.—The Judges awarded 7*l.* to Mr. Michael Goodall, of Evelith Manor, near Shiffnall, for his 5 years 1 month old cow of the Indian and French cross breed. Also, 2*l.* to Mr. George Drake, of Manor Farm, East Tytherley, for his 10 months old pure Hereford bull calf. Also, 1*l.* to Mr. G. Drake, for his 6 months 3 days old cow-calf.

Long-woolled Sheep.—The Judges awarded 10*l.* to Mr. C. Large, of Broadwell, Burford, Oxon, for his 4 years 4 months old new Oxfordshire ewe.

Short-woolled Sheep.—The Judges awarded 4*l.* to Mr. T. B. Northeast, of Tedworth, Marlborough, Wilts, for his 3 years 5 months old Southdown ram. Also, 2*l.* to Mr. T. B. Northeast, for his 3 years 5 months old Southdown ram. Also, 4*l.* to Mr. W. Sainsbury, for his 3 years 7 months old Southdown ram.

Pigs.—The Judges awarded 2*l.* to Mr. Hobbs, of Markshall, for his 8 months old improved Essex boar. Also, 2*l.* to Mr. Hobbs, for his 7 months old improved Essex boar. Also, 1*l.* to Mr. W. J. Calhoun, of Binderton, Chichester, for his 10 months old Sussex sow. Also, 3*l.* to Mr. Hobbs, for his 9 months old improved Essex sow.

Horses.—The Judges awarded 5*l.* to Mr. R. Curtis, of Basingstoke, for his 4 years 2 months old stallion. Also, 5*l.* to Mr. John Thomas Glasspool, of Southampton, for his 2 years 3 months old three-parts bred mare.

The following are the names of the gentlemen who officiated as judges of the stock:—

The judges of the *Short-horns* were Mr. Hugh Watson, of Keillor, near Angus; Mr. W. Torr, of Riby, near Caistor; Mr. Charles Stokes, of Kingston, near Kegworth.

Of the Herefords—The Rev. J. Smythies, of Gray Friars, Colchester; Mr. James Peake, of Hanwood, near Ross; Mr. J. Ashdown, of Uppington, Shrewsbury.

Of the Devons—Mr. J. Hudson, of Castle Acre, near Swaffham; Mr. J. Druce, of Ensham, near Oxford; Mr. E. Franklin, of Ascot, near Benson, Oxon.

Of the Channel Islands Breed—Mr. W. R. Browne, of Davenport-street, Bayswater; Mr. J. Clayden, of Littlebury, Saffron Walden; Mr. M. Gibant, of Main Land, St. Lawrence, Jersey.

Of the Cross Breeds—Mr. J. Hall, of Wiseton Bawtry; Mr. N. Smith, of Martley, Worcestershire; Mr. H. Palfrey, of Upton-on-Severn.

Of the Leicesters—Mr. T. Metcalf, Harleston, near Northampton; Mr. H. Bateman, Asthally, Witney, Oxon; Major Brown, Welbourne, Grantham.

Of the Southdowns—Mr. T. Weall, of Woodcot Lodge, Croydon; Mr. R. Emery, of Harston Place, Storrington; the Hon. W. Gage, of Westbury, Bishop's Waltham.

Of the Longwools—Mr. W. Gillett, of South Leigh, Witney; Mr. J. Elliott, of Chapel, Brampton; Mr. W. Anderson, of Oakley, near Bedford.

Of the Shortwools—Mr. J. Chapman, 29, Park-street, Dorset Square; Mr. J. Harris, of Hinton, Abingdon; Mr. T. Morris, of Ranscombe, Lewes.

Of Pigs—Mr. John Farncomb, of 5, Patriot-place, Brighton; Mr. Jesse Kemp, of Utterby Grove, Louth; Mr. R. J. Wiley, of Hornby, near Catterick.

Of the Horses—Mr. W. F. Karkeek, of Truro, Cornwall; Mr. Charles Bowman, of Greatford, Bourne; Mr. William Day, of Ensham, near Oxford.

On Friday at noon, the general meeting of the Agricultural Society took place at the Victoria Archery-rooms. Earl Spencer took the chair. The thanks of the Society were presented to the Mayor and Corporation of Southampton, for the readiness which they had shown to meet the wishes of the Society, and to do all in their power to further its objects—also to Mr. Gater, upon whose land the light implements had been tried, for the exertion he had bestowed on the preparation of the light land; and to Mr. Spooner, of Ealing Farm, owner of the land on which the heavy implements were tried. The Marquess of Downshire then rose to propose that the thanks of the Society be given to Earl Spencer for the ability with which he had presided over the meetings of the Society during the whole of his presidency. He had no doubt that the great prosperity which the Society had attained was to be attributed mainly to the great interest evinced in its proceedings by the noble Earl, the zeal he had exhibited in carrying out its objects, and the great personal trouble and inconvenience to which he had put himself in order to give effect to its proceedings. Sir R. Price seconded the motion, which was carried by acclamation. Earl Spencer said that it had most undoubtedly been his earnest wish to promote to the utmost of his power the interests of the Society. He must be allowed the expression of his gratification that the Society in general, and this annual meeting in particular, had been so successful.—The thanks of the Society were then presented to the late Mayor of Southampton and to the Chairman and Board of Directors of the South Western Railway for the assistance they had given in bringing the cattle to the Show, and for the liberality they had evinced in reducing their charges to meet the occasion. The meeting then broke up.

Reviews.

Annual Register of Agricultural Implements, Southampton, 1844. By Cuthbert W. Johnson, Esq., F.R.S., &c., and Jabez Hare. James Ridgway, Piccadilly.

The annual appearance of this work is very useful, as showing the progress made in English agricultural mechanics. Most of the different implements mentioned in it are illustrated by woodcuts, as well as by description. In the present case the work—a Guide to the Southampton Meeting—contains an interesting description, geological, agricultural, and historical, of the country between London and Southampton.

From this we extract the following, descriptive of the Wiltshire mode of managing water meadows:—

"In the autumn, the after Grass is eaten off quite bare, when the manager of the mead (provincially, the drowner) begins to clean out the main drain, and 'right up the works;' that is, to make good all the carriages and drains which the cattle have trodden in, so as to have one tier or pitch of work ready for drowning. This is immediately put under water, while the drowner is preparing the next pitch.

"In the flowing meadows this ought to be done, if possible, early enough in the autumn to have the whole meadow ready to catch the first floods after Michaelmas. The water then being the first washing of the arable lands on the sides of the chalk hills, as well as the dirt from the roads, is then thick and good; and this remark as to the superior riches of the flood-waters is one that is commonly made in Berkshire and other parts of England. The length of the autumnal watering cannot be precisely stated, as much depends upon situation and circumstances; but if water can be commanded in abundance, the custom is to give meadows 'a thorough good soaking at first,' perhaps for a fortnight or three weeks, with an intermission of two or three days during that period, and continue for the space of two fortnights, allowing an interval of a week between them. The works are then made as dry as possible to encourage the growth of the Grass. This first soaking is to make the land sink and pitch close together—a circumstance of great consequence, not only to the quantity, but to the quality of the Grass, and particularly to encourage the shooting of new roots, which the Grass is continually forming to support the forced growth above.

"While the Grass grows freely, a fresh watering is not wanted; but as soon as it flags, the water must be repeated for a few days at a time, always keeping this fundamental rule in view—'to make the meadows as dry as possible after every watering, and to take off the water the moment any scum appears upon the land, which shows that it has already had water enough.'

"Some meadows that will require the water for three weeks in October, and the two following months, will not perhaps bear it a week in February or March, and sometimes scarcely two days in April and May.

"In the catch-meadows, which are watered by springs, the great object is to keep the works of them very dry between the intervals of watering; and as such situations are seldom affected by floods, and generally have too little water, it is necessary to make the most of the water by catching and rousing it as often as possible; and as the upper works of every pitch will be liable to get more water than those lower down, a longer time should be given to the latter, so as to make them as equal as possible."—(*Davies's Agriculture of Wiltshire*, p. 125—7.)

"In Berkshire they first flood their water-meadows about Michaelmas; these are situated principally on the banks of the Kennet. The first flooding they deem the richest in quality; this they keep on the land for about four days, then they dry it for about a fortnight, and then the water is let on for three or four days more. Those meadows which are the most readily dried are the most productive. There are none more so in fact than those which have a porous, gravelly, or broken flint bottom, from which the flood-water readily escapes, almost without drains. They begin to feed their meadows with sheep about the 6th of April, and continue feeding till about the 21st of May, when the meadows are again flooded for a crop of Hay; the land is then flooded and dried alternately for three days until Hay-time.

"The land in Wiltshire, under this kind of management, has been computed, and with a tolerable degree of accuracy, to be between 15,000 and 20,000 acres. Some considerable additions, however, have been made to the water-meadows of the district since this calculation was made. (*Davis's Wilts.*, p. 122.) About the same number of acres are formed into water-meadows in Berkshire, and a still larger number in Hampshire."

Miscellaneous.

Sheep Salve.—Having left the south country, I came to Fife, and got employment on the farm of Ballo, on the Lomond Hills. At that place, power was given me to manage the sheep entirely after my own fashion, and after much thought on the subject, and seeing so much harm done by the usual salves, I set myself to consider what were the real objects to be gained by salving. I considered they were twofold; first, the destruction of vermin, and, second, the growth of wool of superior quality. Now, it is clear that the more innocent the substances used, so much the better will it be for the sheep as well as the wool; for, in looking at the composition of the usual salves, it is easy to see that the tar, the turpentine, the juice of tobacco, and arsenic, are all merely calculated to kill vermin, and cannot possibly be beneficial to wool, but rather detrimental; while the absorption of a portion of any of them through the pores of the skin cannot fail to hurt the animal more or less, according to the quantity absorbed. Butter, therefore, appeared to be the only article that could benefit the wool, and at the same time not hurt the sheep. I then considered that possibly oil of the cheapest sort, and used by itself, would serve the intended purposes; but as oil runs off too easily by the heat of the sun, or even by that of the sheep themselves, it occurred to me to mix it with a portion of tallow, which, while it is very nearly of the same nature, would tend to harden the salve, so as to retain it, and I wished to prove this by experiment. I felt assured that I would get superior wool, and I hoped and trusted that it would also prevent vermin on the sheep; but feeling some doubt on the propriety of leaving the tar entirely out, I mixed a portion amongst the oil and tallow in my first experiment. I mixed equal portions of tallow and train oil, weighing together 42 lbs., with 8 pints (16 quarts) of tar, for 100 hogs. I then smeared 400 with that sort of salve, and it proved much better in its results than anything I had ever seen before, both for quantity and quality of wool, and the vermin were also kept away. The wool-stapler said he had never had a clip come through his hands equal to it. Encouraged by this success, I next year left out the tar entirely, and smeared 400 hogs with tallow and oil alone, in the proportions given above; and I found that I had a still larger growth of wool, and of superior quality, so much so, that it realised in the market some

shillings per stone more than any wool cured by salves containing tar—at the same time the advantage to the sheep was most decidedly apparent. From these results I have no hesitation in saying that oil and tallow form the best salve for sheep of any that has hitherto been tried; and that, if the sheep-farmers of Scotland would use that salve alone, they would find their advantage in obtaining—1st, about a third more money for their wool, on account of its superior quality and purity; and, 2d, an improved condition of their sheep. But as long custom renders people unwilling to leave off old habits, it will be difficult to convince them of the propriety of the change, and particularly as to refraining from the use of tar, which was long the only substance used. For this reason I would recommend farmers to try the oil and tallow mixed with a portion of tar, to begin with, and afterwards to dispense with it by gradual decrease; or to try the oil and tallow on a few sheep only, and compare these carefully with other sheep under the usual treatment, and I have no fear of the result being entirely in favour of the oil and tallow, both in regard to satisfaction as well as profit.—*Mr. Stewart, in the Transactions of the Highland Society.*

Manufacture of Butter.—From the account of the experiments of Professor Trail, contained in the Transactions of the Highland Agricultural Society, are derived the following results:—"1. That the addition of some cold water facilitates the process, or the separation of butter, especially when the cream is thick and the weather hot.—2. That cream alone is more easily churned than a mixture of cream and milk.—3. That butter produced from sweet cream has the finest flavour when fresh, and appears to keep longest without acquiring rancidity; but the buttermilk so obtained is poor, and small in quantity. —4. That the scalding of the cream, according to the Devonshire method, yields the largest quantity of butter, which, if intended for immediate use, is agreeable to the palate and readily saleable; but if intended to be salted, is most liable to acquire, by keeping, a rancid flavour. The process of scalding is troublesome, and the milk after the removal of the cream is poor, and often would be unsaleable, from the taste it has acquired from the heating. —5. That churning the milk and cream together, after they have become slightly acid, seems to be the most economical process, on the whole, because it yields a large quantity of excellent butter, and the buttermilk of good quality.—6. That the keeping of butter in a sound state appears to depend on its being obtained as free from uncombined albumen or casein and water as it can be, by means of washing and working the butter when taken from the churn."—*Report of Commissioners of Patents, U. S.*

Rent-day.—To those agents who, by good fortune, acquire the management of estates, and who have no experience but what they borrow from their friends, the author begs them to get practical men to set out and superintend the work, and, in the face of the present times, assist the tenant in doing that which he cannot do himself, and, by so doing, enable him to procure his rent at the time it becomes due, instead of whipping him up and threatening him with distress the moment he got into arrears, and thus meet him with a face all smiles and thankfulness, instead of one as long as a fiddle, and grievances to recount sufficient to fill a sheet of foolscap paper. There is no class of men upon earth so grateful as the British farmer. I do not mean the gentleman farmer, but the man who gets his living for himself and family from his farm, and whose all is invested in it; and there is no man whose heart is so light and happy as the farmer, who, with his half-year's rent in his pocket, can meet his landlord, or the agent of his landlord, with a smiling face, pay his rent, enjoy his dinner and a pipe afterwards, and then return home with the pleasing reflection to his family that he met his landlord, and that he behaved kindly to him, and promised him various things which required doing upon his farm. It is this class of farmers, too, who want assisting, as, when the harvest is over, he has to begin to sell his spring Corn to pay his servants' wages, his Wheat, part to pay his Michaelmas rent, and before Lady-day his stock-yard is cleared. Great rises in the market he never can reap the benefit of, because he cannot keep a Wheat-stack to look at; it is only the gentleman farmer who can derive any benefit from the sudden advance of the market. The system, too, of giving back 10 or 15 per cent., and in some instances 20 per cent., is bad in principle as well as in practice—it gives the landlord a fictitious rental, and returns to the tenant a sum of money in bad times, which he cannot afford to lay out upon his land, but uses for other purposes. — *Hutchinson on the Practical Drainage of Land.*

The Cultivation of Rape.—The value of Rape for spring food has frequently engaged the attention of your correspondents and yourself. You have on several occasions recommended the mode of raising the Rape-plants in a seed-bed, to be transplanted when Flax or Corn is removed; and you seem to doubt the success of sowing the seed after these crops are taken from the ground. I have for several years sown Rape on my Flax ground, broadcast, with perfect success. I would recommend sowing it at three times: the first as early as possible, which this year may probably be about the 1st August; the second about the middle of August; and the third on the 1st September. Rape sown on the 1st August will, in an ordinary season, give a good cutting very early in April; and that sown 1st September will last till the Clover is ready for cutting. The ground occupied by the Rape may be sown with Spring Vetches in May and June, in order to succeed the second cutting of Clover. A portion of the Flax ground may be sown late in September with Winter Vetches, and another portion in February with Spring Vetches. These will come into use a full crop between the first and second cuttings of Clover, and may be succeeded with transplanted Swedish Turnips, which may be supplied in the best manner by thinning the sown Swedes to 6 inches at first, and, when the plants are strong, removing the alternate ones for transplanting. The ground on which Flax has grown is the best adapted for the treatment described, the Flax crop being the first taken from the ground. Two full crops of green food are thus secured in the same season. Manure must be given to the Rape and transplanted Turnips; but if the house-feeding system be carried out to the full extent, there will be no scarcity of manure for every purpose; and it is good economy to get the manure into the land as soon as possible after being collected. Rape and Vetches are essential to a complete system of house-feeding; they fill up the intervals in spring, summer, and autumn, when Turnips and Clover cannot be commanded. Cabbages, to a moderate extent, are also most useful. By planting early and late Cabbages in early spring alternately, the early kinds are brought forward for use in July and August; and the late, then standing at wide distances, have room to complete their growth by October and November.—*J. A., in the Dublin Farmers' Gazette.*

Notices to Correspondents.

Barley.—*Youell & Co.*—Your specimen (it arrived in a mutilated state) is a long ear of six-rowed Barley. The grain appears fine and plump.

Books.—*J. R. Pearson.*—Sinclair's "Hortus Gramineus Woburnensis."

Camelina sativa.—*E. B.*—Mr. Sproule's directions for the cultivation of Flax may be safely followed in most particulars, with reference to this plant. See former Numbers of the *Gazette*. Further information hereafter.

Coltsfoot.—*T. R. Avery.*—Your note of July 23 is the only one we have received from you. The best way to rid the land of Coltsfoot is perseverance in pulling the flowers in spring, and the leaves with as much root as possible whenever they appear.

Early Spring Crops.—*J. Rosetta.*—You may have Cabbages early in April, by sowing the seed of an early sort in beds now, and transplanting at the right time. And if you sow Vetches in September, on good soil, you may expect to be able to cut them early in May.

Failure of Crops.—*Leicestershire Farmer.*—The only chance of a remedy for your case, so far as we know, lies in sowing late Turnips; and in sowing early Cabbage, to transplant in October for use in April.

Fixation of Ammonia.—*S. Newington.*—Burnt gypsum contains about half its weight of sulphuric acid. The greater certainty of its operation would induce us to prefer the latter, though at greater expense. Unquestionably, it is advisable to convert the carbonate of ammonia into sulphate, or some other fixed form of ammoniacal salt. The difference in price between sulphate and carbonate of ammonia arises from the mode of their manufacture. The former is prepared from gas water, most of which used to be wasted as useless.

Gas-lime.—*Jack Spratt.*—If you first expose it for a considerable time to the air, it may be beneficially mixed with manure.

Gypsum.—*W. T. B.*—This manure may be adulterated with lime. Purchase only from a respectable dealer. The application of more than is necessary to fix ammonia is not injurious, and may be beneficial. Gypsum is sold in powder; if you obtain it in the solid form, it may be pulverised by burning.

Manures.—*L. O.*—The manure from the tan-yard, which you describe, is probably superior per bulk to ordinary farm-yard manure. Old ashes in night-soil dilute it, and so far injure it; but they are not injurious in themselves.

Potash.—*Constant Reader.*—This alkali can be applied to land as nitrate. Apply 1 cwt. of saltpetre, which is nitrate of potash, per acre.

Potatoes.—*Petto.*—Your abundant haulm justifies your anticipation of a good crop. Do not roll the plant down—we never heard of such a thing. Try the effect of pulling the blossoms.

Small Farms.—*An Inquirer.*—We cannot learn that any question has been received from you on this subject. We heartily wish that Cobbett's perspicuity could be transferred to all writers on rural affairs. But how is that to be done? There are few men who are very clear-headed, and no education will render persons perspicuous whose ideas are perplexed.

Tankard Swede.—*A Reader.*—There is a variety of this form; apply to your seedsman.

Turnip Cutter.—*W. C.*—An implement of this class was exhibited at Southampton by Mr. Philipps, of Bristol, having a cross-cutting apparatus, reducing the finger-shaped pieces in which the Turnip is delivered to a uniform length of about 1½ inch. All roots are the better of being washed, whatever the mode in which they are to be given as food. Your other questions next week.

Wireworm.—*Fudge.*—Now that they are actually at work on your Swedes, we know of no help for you.

Miscellaneous.—*Claudiocestriensis.*—We do not know Mr. Smith's address, but a letter to him at Deanston would probably be forwarded.

***As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, July 29.—Per stone of 8 lbs.

	s.	d.	s.	d.		s.	d.	s.	d.
Best Scots, Herefords, &c.	3	8	to 4	0	Best Downs & Half-breds	3	8	to 4	0
Best Short Horns	3	4	3	8	Best Long-wools	3	6	3	8
Second quality Beasts	2	10	3	4	Ewes and second quality	3	2	3	6
Calves	3	8	4	2	Lambs	4	0	4	10
Pigs	3	0	3	8					

Beasts, 2958; Sheep and Lambs, 37,330; Calves, 188; Pigs, 312.

The supply of Beasts to-day is large, and the trade very heavy; on the whole, prices are lower; 4s for the best Scots, &c., is quite an extreme quotation, not being generally realised; many of the best Short-horns, also, are sold under 3s 8d, and middling qualities are very heavy on hand—several remain unsold. The number of Sheep is larger than we have known for a long period, and, considering the quantity, the prices, although lower, are better than could be expected, showing a disposition to improvement, should the supply at all decrease, which is highly probable. Lamb is a shade lower; still, there are many buyers for the best qualities, which suffer but a small reduction. Calves are rather shorter, and a little better trade.

Friday, Aug. 2.

We have a fair supply of fresh Beasts, which, with those left from last Monday, cause a large market. Trade is heavy, though we cannot quote prices any lower—indeed, the trade having been pretty good in the dead market since Monday, has caused a good attendance of buyers. The supply, also, of Sheep and Lambs is pretty good, but there is a good demand, and everything makes fully 2d per 8 lbs more than on Monday. Veal is rather better trade, there being several less than last week. Pork has also improved, the weather having been during the week favourable for the sale of this article.

Beasts, 907; Sheep and Lambs, 11,330; Calves, 414; Pigs, 270.
41, West Smithfield.

WOOL.—British, Friday, Aug. 2.

Our English Wool Market continues active. The demand for nearly all descriptions is good, and prices have slightly advanced.

	per lb.					per lb.

Do. Hoggitts	1	1	1	3½	Kent Fleeces	1	1	1	5½
Southdown Fleeces	1	0	1	1					

James Perrin, Wool Broker.

COVENT GARDEN, Aug. 3.—In consequence of the late favourable weather, the supplies are amply sufficient to meet the demand. Pine-apples of good quality are brought, and among them are some good Providences, Queens, and Montserrats. Some fine-looking bunches of Black Hamburgh and Muscat Grapes are to be met with, which are offered at nearly the same prices as last week. Peaches and Nectarines are not so large as we have seen them; and Apricots, although abundant, are very small. Orleans, Green Gages, and other kinds of Plums, are becoming more abundant; but Strawberries, Currants, Gooseberries, and Dessert Cherries, are getting scarcer, particularly the former; Cherries for preserving are plentiful. Of Pears, some good specimens of Jargonelle may be met with. The supply of Apples is good, and they are of larger size than they were last week; they consist chiefly of Juneating and a few Hawthorndeans. Abundance of good foreign Melons are in the market; but good English-grown varieties are scarce. A few Figs have been offered during the week at from 4d. to 6d. each. There has been little alteration in the price of Vegetables since our last Report. The late showers have favoured the growth of Peas, which continue to be well supplied, although not so abundantly as a few weeks back. Cauliflowers are fine, but they are becoming scarcer. Potatoes and Carrots are clean and good; French Beans are sufficient for the demand, and Celery is good for this early period of the season. Salading and Herbs of every kind are abundant. Cut Flowers consist of Combretum purpureum, Ceanothus azureus, Bignonia venusta, Alstrœmeria pelegrina, Carnations, Picotees, Heaths, Pelargoniums, Verbenas, Fuchsias, Gardenias, Roses, and a few Camellias.

FRUITS.

HOPS, Friday, Aug. 2.

The accounts are daily getting worse, and the duty is to-day at 140,000*l.* Several lots of Hops have been sold during the week at better prices.

Patenden & Smith, Hop-Factors.

MARK-LANE, Monday, July 29.

The show of English Wheat by land carriage samples this morning was considerable, having, in addition to a liberal arrival, some portion of last week's remaining over unsold; the Millers evincing a total indifference to purchase, but little progress could be made with sales generally, even at a decline of 4*s.* to 5*s.* per qr. Foreign was equally difficult to dispose of, although offered at a reduction of 2*s.* to 3*s.* per qr.—Barley is very unsaleable, and the turn cheaper.—With the exception of new White Peas, which sell currently at our quotations, other descriptions, and Beans, are rather lower.—There was a fair quantity of Oats offering, which met a slow sale at a decline of 6*d.* per qr.—The nominal price of Flour remains unaltered, but the trade are generally selling at rather less money.

Friday, Aug. 2.

The weather here since Monday having been changeable, and the accounts from many parts of the country describing it as bad, no disposition has been evinced to press sales of Wheat, either on Wednesday or this morning. The attendance of buyers was tolerably good, but holders not being inclined to accept the terms offered, very little business was transacted. The quantity entered for consumption during the week has been 47,533 qrs.—Barley and Beans are a very dull sale.—The greater part of the White Peas sold on Monday were refused; the show of samples this morning being large, they could not be disposed of, except at a decline of 4*s.* per qr. Maple and Grey remain unaltered.—The Oat-trade is very heavy, and foreign as well as stale qualities must be written 6*d.* to 1*s.* lower.

Kingsford and Lay.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, July 26, 1844.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the Ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to JAMES CLARK, 24, Billiter-street.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, June 12, 1844:—

Bones	.	p. ton	£4	10s.	0d

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

TO FLORISTS AND ADMIRERS OF FLOWERS.

BRAIN'S CONCENTRATED LIQUID GUANO, for the Garden, Shrubbery, Hothouse, and Conservatory.

This preparation is peculiarly adapted for the development of Flowers, furnishing them with the materials (in a soluble form) out of which they weave their delicate tissues and elaborate their beauteous colouring. It has no unpleasant smell, is easily applied, and thus recommends itself, either for the Garden or Drawing-room.—Price 1s. 9d. per quart Bottle, and may be had of most respectable Druggists and Seedsmen, with full directions for use inclosed.—Works, Thomas-st., Stamford-st., Blackfriars-road.

HAYMAKING SEASON. — Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade.
THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10l. per ton, or 12s. per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3-inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and SONS, Milbank-street, Westminster.

THE HARVEST.

DRUMMOND'S IMPROVED REAPING SCYTHE.—These Scythes, which continue to give great satisfaction for cutting Oats, Barley, and Wheat, are now offered for sale by the Subscribers, complete at 10s. each, or 12s. delivered in London, Liverpool, Hull, Belfast, or Londonderry. Should more than three be taken they will be sent free at 11s. each. **** Orders from other than regular customers to be accompanied with a remittance. W. DRUMMOND & SONS.

Agricultural Museum, Stirling, N.B., and 16, Dawson-street, Dublin.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1s. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June 6*, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

PRESERVES and CONFECTIONERY. — The superiority of BETTS'S PATENT BRANDY for PRESERVES and CONFECTIONERY, is testified by the fact that it is preferred to any other spirit by the most extensive WHOLESALE CONFECTIONERS in the METROPOLIS; for fortifying Home-made Wines it is invaluable; as an Ordinary Beverage it is congenial to the most delicate constitutions; and, as a Medical Stimulant, it is peculiarly adapted to persons of bilious or dyspeptic habits. Quantities of not less than Two Gallons, supplied at the Distillery, 7, Smithfield Bars, in Stone Jars, at 18s. per Gallon, exclusive of the price of the Jar; and in Glass Bottles, at 20s. per Gallon, Bottles and Case included.

CONSUMERS of BRANDY are respectfully informed, that J. T. BETTS, JUN., and Co., will not be responsible for any BOTTLED BRANDY that is not protected against fraudulent substitution, by the PATENT METALLIC CAPSULES, made of pure and solid metal (*not tin-foil*), embossed with the words "Betts's Patent Brandy, 7, Smithfield Bars," *to which attention is especially directed.*

EXTRACT FROM OLD MOORE'S ALMANAC for 1844.—"AUGUST.—CARE OF HEALTH.—This is generally the hottest month in the year; languor and inability for active mental and bodily exertion is experienced by all, but more especially by ladies and those of delicate constitution. Recourse should be had to that excellent medicine, Parr's Life Pills, which will quite re-invigorate the whole system, and render the heat of this month, which is otherwise so oppressive, as delightful as any month in the year."

PARR'S LIFE PILLS are sold by all respectable Medicine Vendors.

See the words "PARR'S LIFE PILLS," in White Letters on a Red Ground on the Government Stamp.

BRIGHT'S CUSTARD COMPOUND. — The ORIGINAL VEGETABLE PREPARATION, for making custards without eggs. Patronised by the Royal family, Nobility, and Gentry, with the approval and testimony, amongst many others, of the COOKS to SIX CROWNED HEADS. Sold in boxes at 1s. and 4s. each. Manufactory, 5, Holland-street, North Brixton, Surrey. Wholesale of all respectable houses, and retail by upwards of 1000 chemists, confectioners, grocers, Italian Warehousemen, &c., throughout the United Kingdom. Caution—Beware of imitations, and observe on all sent out the signature of the Inventor, JOHN BRIGHT.

AGRICULTURE, COMMERCE, NAVIGATION, the CHURCH.—A. B. SAVORY and SONS, GOLDSMITHS, 14, Cornhill, London, opposite the Bank, have finished a few Splendid Pieces of PLATE, suitable for Presentation to Gentlemen connected with either of the above pursuits or professions, to which they invite the attention of committees who are in search of valuable testimonials for such occasions.

DOULTON AND WATTS, LAMBETH POTTERY and TERRA COTTA WORKS, High-street, Lambeth, London.

DOULTON and WATTS beg respectfully to solicit the attention of the Nobility and Gentry to the Figures, Vases, Fountains, &c. newly manufactured by them in Terra Cotta, the decided superiority of which over artificial Stone or Cement is well known. D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, which being subjected to a high degree of fire, is rendered imperishable, and presents a sharpness and surface which no frost or changes of temperature can impair.

D. and W. are enabled to offer the above at a considerable reduction in price, and will forward Drawings and Designs Gratis on application.—Architectural work executed.

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised and universally adopted Specific is a balmy, odoriferous, creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank), than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4s. 6d. and 8s. 6d. per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "GENUINE KALYDOR:"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

**** All others are FRAUDULENT COUNTERFEITS!!!

FELIX SUMMERLY'S Home Treasury of Books, Pictures, Toys, &c, purposed to Cultivate the Affections, Fancy Imagination, and Taste of, Children.

IMPORTANT TO AGRICUTURISTS.

Now in the Press, the 2nd Edition,

A PRACTICAL ESSAY, with Proper Rules for the Application of GUANO AS A MANURE, arranged for all Soils and Crops, Horticulture and Greenhouse; with full instructions, reports, and results of the late Southampton Meeting, on the very extraordinary and beneficial effect produced from its application in Wheat, and so strongly recommended to be adopted at the approaching Wheat-seed season, as being a decided protection to the plant in severe weather, a preventive from the destruction of crops generally by the ravages of all insects, wireworm, &c.; added to which the practical manner, reports, and results to be ascertained from the highly interesting meeting to take place on the 9th inst., at Glasgow, of the Highland and Agricultural Society of Scotlend, who adopted Guano earlier, and more extensively introduced it than any Agriculturists or Societies in the United Kingdom.

Applications to the author only can be supplied, if by letter, post paid, inclosing 1s. 4d.; and 1s. 8d. if to be posted prepaid and to inclose a Treatise on Gypsum, 2s.

N.B.—Genuine Guano supplied per ship at Liverpool, 6l. 6s., and for spring delivery, 1845, 6l. per ton. Payments by approved bills at three months date, or a discount allowed for cash.—Direct to J. H. Sheppard, Chester.

WITH THE APPROVAL OF THE LORDS COMMISSIONERS OF HER MAJESTY'S TREASURY.

COMPLETION OF THE ZOOLOGY OF THE BEAGLE.

Just completed, in Five Vols., bound in cloth, or in half Morocco or Russia, at a small addition to the price,

THE ZOOLOGY OF THE VOYAGE OF H.M.S. BEAGLE, under the command of Captain Fitzroy, R.N., during the years 1832 and 1836. Edited and Superintended by Charles Darwin, M.A., F.R.S., V.P.G.S., Naturalist to the Expedition. Comprising highly-finished representations of the most novel and interesting objects in Natural History, collected during the Voyage of the Beagle, with descriptive letterpress, and an account of the habits and ranges.

Contents of the Volumes:—Fossil Mammalia, by Richard Owen, Esq., F.R.S., plain plates, 1l. 14s.—Mammalia, by R. Waterhouse, Esq., coloured, 2l. 2s.—Birds, by John Gould, Esq., F.L.S., coloured, 3l.—Fish, by the Rev. Leonard Jenyns, M.A., F.R.S., plain plates, 1l. 18s.—Reptiles, by Thomas Bell, Esq., F.R.S., F.L.S., plain plates, 1l. 2s.

Each Volume is complete in itself, and may be had separately.

GEOLOGICAL OBSERVATIONS, made during the VOYAGE of the BEAGLE, in Three Parts.

By Charles Darwin, M.A., F.R.S., V.P.G.S.

Just Published, in 1 vol., 8vo., price 15s., cloth.

Miscellanea.—Paris Academy of Sciences—On Converting Centigrade into Fahrenheit degrees—Captain Warner's Experiments—The Late Theodor von Holst—The Telephone, &c.

Order The Athenæum of any Bookseller or Newsman.

Just published, the Thirteenth Edition, price 2s. 6d.; free by post, 3s. 6d.,

THE SILENT FRIEND on NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. Perry and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho; Wilson, 338, Oxford-st. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11s. and 33s. Perry's Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2s. 9d., 4s. 6d., and 11s., by all Medicine Venders.

Messrs. Perry and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

A TYPOGRAPHICAL ERROR having occurred in the following Advertisement, of July 20th, we repeat the same for the information of our Subscribers:—

MAUND'S BOTANIC GARDEN.—Large Paper: Consisting of highly-finished Representations of Ornamental Flowering Plants; their History, Culture, &c., from the commencement, in 1825, to July, 1843; with the Floral Register and Auctarium. 10 Volumes, half-bound, red Morocco extra, gilt backs; and 7 Numbers, 10l. 15s.; published at 16l. 16s., in Numbers. Henry Wright, 51, Haymarket.

Price Sixpence, Free by Post Sevenpence,

The Lancet,

Of Saturday last, July 27 contains:—

LECTURES on the OPERATIONS of SURGERY and on DISEASES and ACCIDENTS requiring OPERATIONS, by ROBERT LISTON, Esq. (Lecture V.):—
Ulceration of the Nose. Rupia. Lupus. Restoration of the Nose. Taliacotian Operation.
On the Errors and Mischiefs of the Sound and Catheter, and on the Nature and Treatment of Urinary Stricture, by T. Wilkinson King, Esq.
Practical Facts and Observations on Diseases of Women, and some Subjects connected with Midwifery, by G. O. Heming, M.D.—On Uterine Polypus.
Case of Enormous Urinary Abscess in the Scrotum, by R. J. Chance, Esq.
On the Treatment of Secondary Syphilis by Means of Mercury, by Spencer Thomas Smith, Esq.
Case of Enlargement of the Heart after Palpitations caused by Menorrhagia, by William Henderson, M.D.
On Valvular Disease of the Heart, and its Auscultatory Symptoms, by Richard Chambers, M.D.
BRITISH MEDICAL JOURNALS—
Meningitis at Gibraltar.
Poisonous Effects of Sulphate of Quinine. Influence of Civilisation on Disease. Tubercle of the Bronchial Glands. Matico. Compound Fracture of the Leg during Pregnancy. Excision of an Inverted Uterus. Prevalence of Calculous Disease in the East Indies. Characters of the Pulse in Disease of the Heart.
CHEMISTRY, PHARMACY, AND MATERIA MEDICA:—
On the Inorganic Constituents of Plants, by Dr. H. Will and R. Fresenius.
Analyses of Blood in Diseases.
The Conduct of the Council of the College of Surgeons under the New Charter.
Mr. Wodehouse and Mr. Wakley. A late Proceeding in the House of Commons.
Charge of Manslaughter against a Person practising as a Surgeon.

Hospital for Consumption and Diseases of the Chest.—Cases and Clinical Remarks, by W. H. Walshe, M.D.—Phthisis, Emphysema, Hydro-Pericardium.
Letter on Repeated Examinations during Medical Education.
Qualifications required in Druggists in Norway.
MEDICAL SOCIETIES:—
Statistical Society of London.—Vital Statistics. Account of a New Instrument for Detecting the Quantities of Air Breathed, and the Presence of Disease in the System.
Mr. Protheroe Smith's Speculum.
Medical Protection Assembly.—Testimony in Behalf of Mr. Wakley.
Petition to Parliament of Mr. Guthrie concerning the New Charter of the College of Surgeons.
NEWS OF THE WEEK:—
Marylebone Hospital—House of Commons: Medical Bill—Meeting of Fellows of the College—Obituary: Dr. W. Elliott. Dr. Haslam—College of Surgeons—Apothecaries' Hall—Books Received—Correspondents.

Published by J. Churchill, Princes-street, Soho; and may be had of all Booksellers and Newsvenders.

MIND COMPLAINTS, or NERVOUSNESS.—Clergymen, Noblemen, and all who suffer from groundless fear, suspicion, inquietude, &c., confusion, blushing, despondency, indecision, irresolution, head-ache, vertigo, loss of memory, delusion, inaptitude, for society, study, or business, blood to the head, restlessness, wretchedness, thoughts of self-injury, &c., can now not only be relieved, but tranquillised, made happy, and cured. The Rev. Dr. WILLIS MOSELEY, late of Cambridge University, after enduring these sufferings 14 years, discovered their causes, seat, and a perfect cure; and for 25 years has had no relapse. By the same means he has cured numerous clergymen, medical men, noblemen, &c.; and of 11,000 applicants, knows not 20 uncured who have followed his advice. Numerous testimonials can be seen, and references given. Most get well in six weeks. Means of cure sent to all parts. Apply or write. At home from 11 to 3.—9, Charlotte-street, Bloomsbury.

FIFTY POUNDS REWARD.—The hard substance obtained by pressure from the Crude Cocoa-Nut Oil, is an essential ingredient in the PATENT COMPOSITE CANDLES; and, as EDWARD PRICE & Co., hold the Patents for this process, and grant no licences under them, it follows, either that the imitation Composite Candles are entirely different from the Patent ones, or that the imitators are infringing the Patents: the first is generally the case, but to protect themselves against the possibility of the other, EDWARD PRICE & Co. hereby engage to pay a reward of Fifty Pounds to any workman or other person, who may give such information respecting parties pressing Cocoa-Nut Oil, as shall lead to their conviction. The name of the informant will be kept strictly secret, and he need not take a prominent part in the proceedings, as all that E. P. & Co. require, is the first clue to the discovery of the infringers, which they will then follow up for themselves. This advertisement is being published in every newspaper of any circulation in the United Kingdom.

The Candles are now so well known to the Public, that it is hardly necessary to state here that they burn more brilliantly than the best wax, and give so large an amount of light, as to be cheaper, taking this into account, than the commonest Tallow Candles. They may be had of most of the respectable Tallow Chandlers throughout the kingdom; but purchasers must insist on being supplied with "PRICE'S PATENT CANDLES," otherwise they are liable to be deceived with some of the imitations, all called, like the real ones, "Composite." Those parties, really in the trade, who do not yet keep them for sale, are informed that they can purchase of the Patentees, or of Palmer & Co., Sutton-street, Clerkenwell, any quantity, large or small, at the Wholesale price; and that allowances are made in an increasing ratio, to parties taking to the amount of 50l., 100l., 150l., or 200l., at a time; and a very large allowance indeed to parties taking so large a quantity as to enable them to become wholesale agents for an entire district.—Belmont, Vauxhall, July 24th, 1844.

Neatly bound in cloth, price 1s. 6d.,

THE SCIENTIFIC PHENOMENA of DOMESTIC LIFE, as they are presented in the House or in a walk in the Fields, familiarly explained by Charles Foote Gower, Esq., and arranged under the following heads:—The Bedroom; The Breakfast Parlour; The Morning Walk; The Kitchen; The Study; The Summer's Evening, &c. &c.

James Ridgway, Piccadilly, and all Booksellers.

MR. HOARE'S NEW WORK ON THE VINE:

This Day is published, 12mo. 5s. cloth,

A DESCRIPTIVE ACCOUNT OF A NEW METHOD of PLANTING and MANAGING the ROOTS of GRAPE VINES. By Clement Hoare, Author of "A Treatise on the Cultivation of the Grape Vine on Open Walls."

London: Longman, Brown, Green, and Longmans.

Printed by William Bradbury, of Stoke Newington, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the office, No 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, August 3, 1844.

The Newspaper.

SATURDAY, AUGUST 3, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—

Trustees.

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Galley Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5*s.*, 10*s.*, 20*s.*, 50*s.*, and 100*s.* each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1*l.* to 5*l.* per annum; mansions and estates from 10*l.* and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

LUXURIES FOR WET OR WARM WEATHER, REALLY WATERPROOF.

BERDOE'S SUPERIOR LIGHT SUMMER FROCKS, SHOOTING-JACKETS, COATS for the SEA-SIDE, COUNTRY, &c.—An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance or wish to avoid disappointment and vexation.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

News of the Week.

THE arrival of the Vindictive frigate from South America and the Pacific has put us in possession of recent information from Tahiti, which is likely to have an important influence on the question of the French protectorate. It appears that from the time when the French authorities at Tahiti dethroned the Queen and assumed the absolute sovereignty of the island, down to the period when the French Government disavowed the acts of those officers, several months intervened, during which the grossest indignities were offered, not only to Queen Pomaré and her chiefs, but also to our Consul, Mr. Pritchard, and other British subjects. So flagrant, indeed, were these outrages, that Lord Aberdeen on Thursday, in the House of Lords, stated that if he had not received an authentic account of the transactions, they would have appeared to him almost incredible. Queen Pomaré was compelled to take refuge in a small vessel of war: the English officers were obliged to be on board at 8 p.m.; the island was declared in a state of siege; our Consul was seized by the French soldiers in open day, dragged like a convict through the streets, and thrown into prison. Notices were published announcing that the Consul's property was answerable for all damage done to the French establishments, and that "if French blood were spilt, every drop should recoil upon his head." After several days imprisonment, Mr. Pritchard was surrendered to the captain of one of H.M.'s steamers, on condition that he was not again to land in the Society Islands: this steamer conveyed him to Valparaiso, where he embarked in the Vindictive frigate, and he is now in England. Sir R. Peel in the House of Commons on Wednesday, and Lord Aberdeen in the Lords on Thursday, announced in very decided terms, that the Home Government, on hearing of these proceedings, lost not a moment in making such representations to France, as will ensure a full and satisfactory atonement for the outrage. Lord Aberdeen said he had no doubt that it would be welcomed as a godsend by the enemies of peace, but he had reason to believe that by the exercise of a spirit of justice and moderation, it would lead to no serious consequences.—The accounts from Algeria are still indefinite, but a few days must decide whether the mediation of this country will be accepted.—From Germany we learn that the greatest excitement has been produced at Berlin, by a desperate attempt to assassinate the King of Prussia, but providentially without effect. At the moment that his Majesty, on his journey to Erdmansdorff, in Silesia, entered his carriage, in which the Queen was already seated, for the purpose of driving to the railway terminus, a madman fired both barrels of a double-barrelled pistol at him. One of the balls missed altogether, and the other, without wounding, only left a slight trace on the breast of his Majesty. The Queen escaped the imminent danger by having, at the moment, accidentally leaned forward; and in this way the ball, which otherwise would have inevitably hit the Queen, passed behind her. Their Majesties, notwithstanding this event, proceeded on their journey to Erdmansdorff, where they arrived in safety. The assassin was instantly arrested, and with a great deal of exertion was saved from the rage of the populace, and committed to the watch-house. He has been identified as a former Burgomaster of Storkon, and he states, as the motive of his crime, that several petitions for another appointment had been without effect. He has been committed for trial, and so strong was the feeling of indignation excited by the event, that the magistrates of Berlin resolved to have a public thanksgiving for the preservation of the King's life, in all the churches of the capital, on the following Sunday. This melancholy attempt will probably occasion the postponement, for a few weeks, of the intended visit to this country of his Royal Highness Prince William Louis of Prussia.—From Greece also we have accounts of a supposed attempt to assassinate King Otho. A maniac was seized in the attempt to force an entry into the Palace with a drawn sword in his hand, and was stabbed by the sentinel after a vain attempt to arrest his course. The precise object of the intruder is not, however, known, but there is no doubt of his insanity.—The overland mail from India has arrived with accounts from Bombay to the 19th June. The affairs of the Punjaub have undergone little change since the defeat and death of Ittur Singh, and the report of a projected gathering of a large army on the Sutlej had been contradicted. The abrupt recall of Lord Ellenborough had produced a great sensation at Bombay, from which place alone intelligence has reached us. It was not known there what course Lord Ellenborough intended to adopt. The news of his recall is supposed to have reached him on the 14th or 15th, and it was expected that he would at once embark in the Bentinck, then on the point of starting for Suez. It was supposed by others that his Lordship would await the arrival of Sir Henry Hardinge. The meeting of the Beloochee Chiefs at Hyderabad passed over quietly. The accounts from China come down to May 1, but the news is chiefly of a commercial character.

At home, the proceedings of Parliament have been mostly of a routine character, if we except the debate on Captain Warner's invention, and on the French aggressions in Tahiti, for the details of which we must refer to our Report. In regard to the Irish trials, it is announced that the Judges will not all be in town until Friday, the 23d inst.; their lordships shortly afterwards will have a meeting to consider the questions propounded to them by the House of Lords, and it is generally expected that judgment in the case of Mr. O'Connell and the other traversers will be given either on the 29th or the 30th inst. As before stated, when the public business of Parliament is brought to a close, both Houses will adjourn from time to time, until the judgment on the writ of error is pronounced, and until then there will be no formal prorogation.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses, are quite well, and continue at Windsor Castle. Her Majesty and Prince Albert have taken their accustomed airings during the week, both on foot and in an open carriage. The Prince on Monday inspected the battalion of his regiment, the Scots Fusilier Guards, stationed at Windsor. On Wednesday, the Queen Dowager, who left town for Bushy Park on Monday, paid a visit to the Queen and Prince Albert, accompanied by Prince Edward of Saxe Weimar, and, after partaking of a *dejéuner*, returned to Bushy in the afternoon. The Queen Dowager visited the Exhibition of Frescos and Sculptures in Westminster Hall on Saturday, and the Exhibition of the Royal Academy on Monday. The visitors to her Majesty this week have been the Earl of Aberdeen, the Duke of Wellington, Sir R. Peel, the Earl of Jersey, and the Countess Wratislaw.—The Countess of Dunmore has succeeded the Countess of Mount Edgcumbe as lady in waiting; the Marquis of Ormonde has succeeded Lord Rivers as lord in waiting; Mr. Ormsby Gore has succeeded the Hon. Capt. Duncombe as groom in waiting; the Hon. Col. Grey has succeeded Col. Buckley as equerry in waiting; and the Hon. Misses Hamilton and Stanley have succeeded the Hon Misses Paget and Liddell as Maids of Honour in waiting on Her Majesty. Maj.-Gen. Wemyss has succeeded Col. Bouverie as equerry in waiting on Prince Albert.

THE KING OF SAXONY.—On the evening of Tuesday, the 23rd, His Majesty arrived at the Argyll Hotel, Inverary, where he dined. Next morning, after breakfast, His Majesty was waited upon by Mr. Robertson, Chamberlain to the Duke of Argyll, who accompanied His Majesty and suite through the picturesque pleasure grounds of his Grace. After the party had visited Inverary Castle, they proceeded to the top of the neighbouring hill of Dunquaich, where there is a beautiful view of the surrounding scenery, with which His Majesty expressed himself highly gratified. Having returned to the hotel, His Majesty and suite soon after entered their carriages, and proceeded by Dalmally to Oban, where a steamer was in waiting to take the Royal party to the islands of Staffa and Iona. After remaining on the islands some time, His Majesty proceeded to Fort William, where he passed the night.

Death of the Earl of Mountnorris.—We regret to announce the death of George, Earl of Mountnorris, at his seat, Arley Castle, on the 23rd ult. His lordship was born in 1769, and was the sole surviving son of Arthur, first Earl of Mountnorris, and eighth Viscount Valentia. The Earl married, in 1790, the Hon. Ann Courtenay, daughter of the second Viscount Courtenay, by whom he had issue, George Arthur, the late Viscount Valentia, who died without issue, in 1841. The earldom becomes extinct; but the viscounty and other honours devolve on Arthur Annesley, Esq., of Bletchington-park, Oxon, and the estates in England and Ireland descend to the Earl's nephew, Arthur Lyttelton M'Leod, Esq., of Broadwas-court, Worcestershire. As Lord Valentia, the late Earl of Mountnorris became well known in the literary world some years ago by his "Travels in the East," and other works.

Parliamentary Movements.—Viscount Villiers, son of Earl Jersey and son-in-law of Sir R. Peel, has come forward as a candidate for Cirencester on the Conservative interest, in the room of Mr. Master resigned, and he will probably be returned without opposition.

Foreign.

FRANCE.—The celebration of the *fêtes* of July commenced on Saturday by masses for the slain in all the churches of Paris. Extraordinary precautions were taken to preserve the tranquillity of the capital. The troops were confined to their barracks; the guards were doubled, and the principal forts placed under the command of officers of the staff. In the quarter of the Municipal Guards the men were ready to take arms or mount their horses. The rounds of superior officers were incessant; the Prefecture of Police had received a considerable reinforcement of Municipal Guards and police agents, and the garrison of the Château of Neuilly was trebled at nine o'clock in the morning. Notwithstanding these precautions, the three days passed off without any kind of disturbance; but an accident of a melancholy kind occurred on Monday, a number of persons having been trodden under foot by the crowd, of whom three lost their lives.—The principal article of intelligence from Algiers is the telegraphic despatch from Marshal Bugeaud, announcing a new attack from the Moors, their defeat, and the pursuit of them to the distance of three days' march beyond Ouchda by the troops under his command. Some discrepancies, however, have been noticed between the Marshal's despatch and that communicated by the French telegraph, and they cannot be cleared up until the receipt of fresh intelligence. Some of the opposition papers avow the object of France in the Morocco war to be the overthrow of the Mussulman faith, and the establishment of Christianity in Northern Africa. The *Presse* observes, that the fleets of England, France, Spain, and Denmark, will soon be assembled on the coast of Morocco. "Spain," it says, "demands of the Emperor satisfaction for one of those international crimes, which all the nations of the earth regard as the most odious violation of the law of nations—the murder of an accredited agent. Denmark requires the abolition of the tribute, which is still paid to Morocco by several northern Powers, and to obtain protection for the persons and property of their subjects against piracy. France, in fine, demands reparation from the Emperor of Morocco for the most flagrant violation of treaties, for the most brutal and least justifiable aggression against the peace and territory of her African possessions. But what has England to do in this quarrel—what brings her to Morocco? Her object is very evident—she is going there to protect Islamism and barbarism. She will take care that Spain, in punishing the violation of the sacred right of Ambassadors; that Denmark, in abolishing by force the insolent tribute imposed upon her subjects by pirates; that France, in avenging the violent attempts directed against the security and integrity of her territory, should not strike sufficiently strong to prevent the renewal of such acts. She is, in a word, going to counteract, as much as she can, the interests of civilisation and the designs of Providence upon Africa!" One or two other papers observe that the excessive heat now prevailing in Africa must render all land operations most difficult, and that the heavy rains that will most probably follow, will secure impunity to the Moors until next year, unless a blow be struck on the coast of Morocco.—The Prince de Joinville and his squadron had left Gibraltar, where they had been received with royal honours, and arrived at Cadiz on the 15th. On the 17th, a French steamer had arrived in the bay from Tangiers, with despatches for the Prince, and two hours afterwards the fleet got under weigh, and proceeded to the coast of Africa—it was supposed to Tangiers. The departure of the fleet was so prompt and sudden that several French Officers were left on shore, and had to follow the fleet in a steamer that waited for them. It was reported at Cadiz that several British vessels had arrived at Tangiers, and that some misun-

derstanding had taken place between the crew of one of those vessels and that of a French frigate, and that this was the motive of the Prince de Joinville's sudden movement; but this report naturally requires confirmation.—The debate in the House of Commons on the motion of Mr. Sheil could not fail to be noticed with great eagerness by our Paris contemporaries. The *Journal des Débats* of Friday says:—"This debate, after all, was little more than a family squabble. Whigs and Tories mutually reproached each other with not having protested against the retention of Algeria by France. The Whigs say to the Tories, 'It is you who have spoiled the business. You acknowledged the Government of 1830 without demanding the evacuation of Algeria, and remained four months in power without making the least remonstrance.' The Tories retort upon the Whigs: 'It well becomes you to accuse us of negligence! Did not you remain 11 years at the head of affairs, from 1830 to 1841, without making any protest? Did you not give your tacit assent to the conquest of France during the whole duration of your Ministry? How can we, after your long silence for 11 years, ask the Government of Louis-Philippe to perform the promise of Prince Polignac?' From these recriminations, it is evident to us that neither Whigs nor Tories wish to take the lead in this, but leave to each other the ungrateful task of making protests which they know must be perfectly ineffective." The debate in the House of Lords, on the 25th ult., on the Slave-trade, has also excited much attention. Most of the papers advert to the statement which the Earl of Aberdeen made, in laying before the House the instructions drawn up for the guidance of the naval officers employed in the suppression of the Slave-trade. His Lordship's observations respecting the co-operation of France are viewed with displeasure by the Opposition prints, several of which infer that M. Guizot has done little towards realising the wish expressed by the Chamber of Deputies as to the revocations of 1831 and 1833, and that the right of search stands just as it did before the ratification of the treaty of 1842 was prevented.—M. Castellan, who had arrived in Paris some days since, bearing a modest proposition from the state of Nicaragua, that France should interfere in the dispute between it and Great Britain, and take Nicaragua under her protection, had not up to Wednesday evening received from M. Guizot a reply to the extraordinary demand he had been commissioned to make of the French Government, but it was rumoured that he would apply to Belgium in the event of his receiving a refusal from France.—On Saturday the Chamber of Peers passed the Paris and Strasburg Railway Bill. In the course of the discussion several amendments were proposed, but they were all rejected, and the whole Bill as introduced by the Government was ultimately adopted, by a majority of 73 to 31. In consequence of the quantity of business still remaining for consideration before the Chamber of Peers, the Parliamentary session cannot, it is said, be officially closed before the 5th of August.—The King and Queen of the Belgians and the two Princes, their sons, left Paris for Compiegne on Saturday, and were expected at Brussels on the 29th. It is understood that the arrangements for King Louis-Philippe's visit to Queen Victoria are almost entirely settled. The King and Royal Family will leave Neuilly, for the Château of Bizy, immediately after the close of the session. They will go from thence to the Château d'Eu, where they will arrive about the middle of August. His Majesty will remain at the Château d'Eu till the 12th or 15th of September, when he will embark from Treport for England. Although the day is not exactly fixed for the King's embarkation, the hour of his embarkation is. In order that his Majesty may arrive at Portsmouth before mid-day, it is arranged that he should leave Treport at 11 at night. The King will take his passage in a steamer of war, and will be attended by three other steamers and three ships of the line. At Portsmouth, King Louis-Philippe will be received by the whole of the navy stationed there, with all the honours due to his rank as King of the French. With the least possible delay his Majesty will take his departure by the South Western Railway for Windsor Castle. At the station nearest Windsor her Majesty's carriages will be in attendance to convey his Majesty and his suite to their destination. It is understood that the King will not visit London. He is to remain at Windsor five days, and will return to his own dominions by the same route of Portsmouth and Treport, so that the whole extent of his absence from his own dominions will be eight days. A letter from St. Omer announces that his Royal Highness the Duke de Nemours left that place on the 24th for Metz, after reviewing the troops of the garrison.

Spain.—Advices from Madrid state that very great surprise had been excited by the precipitate departure on the evening of the 20th of the Ministers of Finance and Justice, who had taken the road to Barcelona. The circumstance had made the deeper impression, as it was believed that the Court had determined to quit Barcelona on the 10th August, and to return immediately to the capital. Various conjectures and reports on the subject, some of them of an alarming nature, were afloat. Persons usually well informed, affirmed that serious discord had arisen in the Cabinet in consequence of the recent executions at Saragossa, and that the Members of the Administration stationed at Madrid had held a council, in which the immediate departure of MM. Mon and Mayans had been decided upon, it being hoped that their presence might restore harmony. It was still expected that their Majesties would quit Barcelona on the 8th or 10th, and return to Madrid by Valencia, and not by Saragossa, as had been at first said. Extraordinary precautions were still daily adopted in the capital. Patroles watched every quarter, and the Post-office was constantly guarded. A *bando* had been issued by the Commandant-General of Logrono on the 15th, whereby that province is proclaimed in a "state of siege." As usual in such cases, a military commission is to condemn to death all such as shall be in possession of fire or other arms, conspire against the throne, &c. The *Clamor Publico* observes, respecting this decree, that all Spain will soon be once more proclaimed in a state of siege, as Barcelona, Saragossa, Teruel, Almeria, and many other places already are. On the 11th, the Prince de Joinville and Prince Henry of the Netherlands were at Gibraltar. On the 15th, the French Prince entered the port of Cadiz with three ships of the line, a frigate, and three war-steamers.

Portugal.—The financial difficulties of Portugal amount to a state of national insolvency. The Government, unable to meet its engagements, has convoked its creditors and solicited a renewal of its bills. In the meantime, some of those bills appear to have been protested, and paid immediately after. One instance is mentioned of a Government bill of 225*l.*, passed in part payment of a loan, being tendered after it fell due and dishonoured. It was presented in payment of duties at the Custom-house, in accordance with the express terms of the contract, specified on the face of the bill, and was refused by the director of the Custom-house.—The suppression of newspapers, and prosecution of their editors, seem to occupy the chief attention of the Government. The *Tribuno*, after five prosecutions in a fortnight, was suppressed. The *Revoluçao* has been likewise suppressed, and the editor of the *Patriota* sent to gaol. Mr. Tozer, the British subject, who has been 100 days imprisoned, was placed, on the 23d ult., under the jurisdiction of the British Judge Conservator, and by his order received on that day a notification of the accusation against him. In thus keeping him incarcerated, deprived of the privileges to which he was entitled as a British subject, and the protection which the criminal laws of this country afford to its own subjects, this gentleman has undergone a very severe punishment before trial or conviction. Mr. Tozer still remains imprisoned, not having been admitted to bail.—The government journal has lately published an abstract of the census of the population, &c. of the kingdom, taken in 1841, which represents the latter to be 3,396,972; number of habitations, 840,928; births, 105,306; deaths, 64,523; marriages, 23,390; parishes, 3746; dioceses, 13; patriarchate, 1; electoral colleges, 8; civil governments, 17.

Germany.—A despatch reached Paris on Tuesday stating that "On the 26th ult., at the moment when the King of Prussia was about to set out on a journey, an assassin, named Tscheck, burgomaster at a little village some leagues from Berlin, fired a pistol. The ball glanced off the King's breast, without doing him any mischief. The King continued his journey, and the assassin was arrested." At first this account was scarcely credited, but we regret to say that it is too true, and that his Majesty's escape was almost miraculous. The following is the official account published by the Privy Council at Berlin on the 26th:—"Their Majesties the King and Queen intended this morning at 8 o'clock to commence their journey, first to Erdmansdorf, in Silesia, and afterwards to the watering-place Ischl. The travelling carriage stopped in the porch of the palace, and her Majesty the Queen, after first having received a petition from a poor woman, who was waiting for that purpose, took her seat first. His Majesty the King followed; and at the very moment that he took his seat, and the footman was stooping down for the purpose of turning up the steps, a man from among the surrounding crowd stepped forward close to the carriage, and fired two shots from a double-barrelled pistol in quick succession against the carriage, which at that very moment was starting. His Majesty at once stopped the carriage, and showed to the anxiously-surrounding crowd, by throwing back his travelling-cloak, that he was not hurt, thanking the people at the same time for the sympathy they exhibited, and then ordered the carriage to drive on, and continued his journey on the Frankfort railway. On arriving at the terminus of the railway, it was found, upon closer inspection of the carriage, that both balls had actually penetrated the carriage, and therefore it must be considered as a special grace of Providence that the illustrious travellers remained unhurt. The assassin was arrested on the spot, and was with great difficulty saved from the rage of the populace before being committed to the criminal prison. There he stated himself to be (and was identified as such) the late Burgomaster Tscheck. He is 56 years of age, and was formerly a merchant, afterwards Burgomaster at Storkow, in the Kurmark, which situation he resigned in 1841, after having been censured several times on account of his misconduct. Since then he generally resided at Berlin, and petitioned the different departments for a new appointment, which, however in the absence of any just claims, could not be granted. A similar petition to his Majesty was likewise refused last year. He has always been known as a very violent and passionate man. At his first examination before the Police Court he unhesitatingly admitted his crime, and stated as a motive the rejection of his petitions, declaring, at the same time, that he had committed the act without communicating his intention to any person whatever. His trial will commence forthwith. We thus fulfil our sad duty in bringing before the public notice a crime fortunately until now unknown in the history of Prussia, and which will fill the hearts of all his Majesty's faithful subjects with the deepest sorrow, but will at the same time inspire them with thanks to Providence, which so mercifully interposed in protecting the beloved couple from such imminent danger, and thus saving the country from a loss which would have been irreparable. Privy Council, Berlin, July 26, 1844."—The King of Prussia has addressed a circular to the principal authorities of his kingdom, stimulating their zeal in favour of the poor, and suggesting numerous associations, which may have for their object the mitigation of their sufferings and the guarantee of their future welfare. A letter from Berlin states that the Prussian Government has come to a resolution to abolish imprisonment for debt in all cases.—The King of Prussia's visit to the Imperial Court of Austria, which several Paris journals have asserted would take place in the middle of this month, is by no means certain yet.—A Frankfort paper announces that the arrival of the Queen of Greece in her own native land may be expected very shortly; and adds as a certainty that her Majesty never intends to return to her husband's dominions! This, to say the least of it, appears very problematical.—The accounts from Bohemia describe that country as being still in a very disturbed state. More than 20,000 troops are at present concentrated at Prague. At Brandeis, the garrison of which has been removed to Prague, the people assembled and broke the windows of the synagogue, but without doing further mischief.—A letter from Dresden states that some disturbance took place on the 20th ult., amongst the workmen on the Saxo-Silesian railroad. They were paid for their work as had been agreed on by contract, but they found the sum too small, and about a hundred entered the city, and collected in front of the house of the contractor. The next day the same scene took place, but with the addition of some disorders, a tavern having been pillaged and torn down.—The *Weser Gazette* states that the Austrian Government has opened negotiations with the different German states, with a view to the establishment of a perfect and uniform monetary system throughout Germany.—The *Globe* mentions a report that the British Cabinet has obtained an important concession from the Austrian Government, viz., the reduction of a penny in the pound on the duty on cotton threads.

Italy.—A supplement to the *Journal of the Two Sicilies* of the 13th ult. contains the sentences passed by a military commission upon 76 persons who took part in the movement at Cosenza in March last. There are among them 21 condemned to death, 10 to 30, and 12 to 25 years' hard labour. The same journal, of the 15th, announces that six of the individuals condemned have been executed, and that the King has commuted the penalty of the others into perpetual hard labour. The military commission is now engaged in trying the persons implicated in the attempt recently made in Calabria by the refugees from Corfu. It would appear, however, that the leaders of the expedition, including the two sons of Admiral Bandiera, have not yet been captured, as a proclamation has been recently circulated in Calabria offering a reward of 1000 ducats for the head of Ricciotti, 800 for that of Bandiera, and smaller rewards for the others engaged in the expedition. A letter from Naples of the 16th July, states that the third son of the King of Naples, the Count de Castro Giovanni, is dead.

Greece.—Accounts from Athens of the 10th ult. state that very few of the elections are yet terminated, but those that are so, show a majority in favour of the Government. The country continues perfectly quiet, and, when the elections are terminated, it is believed that all will go on peaceably. The immense harvest just gathered in, and the high prices likely to be obtained this year for most articles of produce, are all in favour of the Government. The weather has been and continues intensely hot.—On the 7th ult., an onomatarch, or sergeant of gendarmerie, made a disturbance in King Otho's new palace, which created a belief that he intended to assassinate his Majesty. The man very nearly lost his life by his conduct. He attempted to enter the palace by a private door in the garden, and being resisted by the sentinel, drew his sword, and forced his way through. The sentinel followed, and stabbed him with his bayonet in the corridor. One of the Queen's ladies of honour, hearing a noise, opened her door, and the corporal fell at her feet bathed in blood. He was taken to the hospital, and is expected to recover. It appears that he had with him a paper, supposed to be a petition to the King, praying for a compensation for some losses he had sustained in an unfortunate speculation in land, and that it was his intention to murder the King, if this extravagant demand had not been complied with; but on opening the paper it was found to be a rhapsody about Alexander the Great. When he first presented himself at the door by which he gained an entrance, he set up a shout of "Long live Alexander!" The affair has attracted great attention, and many at first supposed that it was an attempt to assassinate the King, but there is now no doubt that the man is a monomaniac.

Russia.—Letters from Elsinore of the 23d ult. state that the Russian new line-of-battle ship, New Ingermanland, having on board the Grand Duke Constantine, arrived on the previous night in those roads from Archangel; the fleet, which still remained windbound, was to proceed to the North Sea with sealed orders, and rumour says that it will enter the English Channel. The Russian war-steamer Kamtschatka also came to anchor at the same time; she has a crew of 250 men, and carries 14 howitzers, with 2 pieces throwing 96lb. hollow shot.—The *Augsburg Gazette* says that a courier arrived at Kissingen on the 22d from St. Petersburg, with letters for Count Nesselrode, which gave the most alarming

accounts as to the state of the Grand Duchess Alexandra's health, and left no doubt that her imperial Highness's sufferings would soon close. On the 23d Count Nesselrode was to leave Kissingen for Frankfort, from which place he was to proceed to London.—Letters from Georgia and the Crimea state the Russian army has sustained another most severe defeat in Dagghistan. Shamil Bey, after collecting forces from all the Caucasian tribes, between the Sea of Asoph and the Caspian, assumed the offensive, and attacked the Russian lines: he is said to have been victorious on almost every point, and the loss of the Russians is said to amount to more than 15,000 men.

TURKEY AND EGYPT.—Letters from Constantinople of the 10th inst. state that our respected Consul-General, Mr. Cartwright, after more than 25 years' services, has been permitted to retire. His departure will be greatly regretted by the inhabitants of Pera, and by none more than by the numerous travellers who were so much indebted to his hospitality. The Porte has ordered that the streets of Pera and Galata shall be named and numbered, and lit with lamps at night, and guarded by police, similar to those of London. On the 8th ult. an event took place at Constantinople which produced the greatest interest in the city and environs for miles round. Some time since an Italian arrived with a balloon, in which he offered to ascend, if the Government would pay the expenses and give him a present. On the 8th, all the preparations, which are said to have cost 18,000 piastres, were completed, and in the presence of the Court, the foreign ambassadors, and thousands of spectators, the balloon and its adventurous proprietor ascended. Its course was across the Marmora, and the news arrived at Pera on the next day that it had alighted safely in a village near Brousa. The excitement caused by the appearance of the balloon as it neared this place, where it fell, is said to have been extraordinary: many of the people were so terrified that they took to flight.—Accounts from Alexandria of the 6th ult. state that Sir H. Hardinge, after visiting Cairo, where he was received with the same honours and distinctions by Ibrahim Pacha as had been previously conferred on him at Cairo by Mehemet, proceeded to Suez, where he embarked on the 29th of June on board the Hindostan, and proceeded forthwith to Calcutta. The other news from Alexandria is important; Ibrahim Pacha had arrived at Alexandria for the benefit of his health. The Pacha was busy laying down fortifications, at the suggestion of French engineers, "against any attempt that may be made by the English to land in Egypt." Egypt is full of French military men. The plague is still very destructive in Alexandria.

INDIA AND CHINA.—The overland mail has arrived with news from Bombay to the 19th June, and Hong-Kong to the 24th April. The event of the month is the sensation created in India by the recall of Lord Ellenborough, and by the independent conduct of the Court of Directors. The political intelligence is not of great moment, if we except the case of the Punjaub. The engagement formerly referred to as having occurred near Ferozepore, between the troops under Ittur Sing, Bhaee Beer Sing, and the two Princes, Kashmeera and Peshora Sing on the one part, and those of the State troops on the other, is still the leading event of the papers. The numbers of the followers of Ittur Sing and his colleagues are said to have amounted to only 7000, while about twenty-seven regiments of infantry, and great numbers of irregular cavalry, with about 120 guns, are said to have been engaged of the State troops. Heera Sing himself was not present, as was formerly rumoured, being at the time in Lahore. The arrangements for the assemblage of the grand army on the Sutlej appear to have been suspended. The meeting of the Beloochee chiefs at Hyderabad, on the 24th May, passed off peaceably; the number present did not exceed 20,000. Scinde generally is quiet. The troops once more are threatened with sickness to an extent, it is hoped, less formidable than that from which they suffered last year.—News from China extends to the 1st of May, but is of little interest. Another riot had occurred at Canton, similar in its origin, though fortunately different in result, to those which occurred in December, 1842. The disturbance arose between some Manilla seamen and Chinese. The Manilla seamen having succeeded in driving back the mob, were pelted with stones, &c. The Chinese however soon collected to a fearful extent, and the most urgent measures were deemed requisite for the safety of the factories. The presence of 200 men from the ships in harbour, with Chinese soldiers and police, fortunately induced the mob to disperse, and nothing further was done to break the peace, though the utmost fears were apprehended.—Accounts have been received at Macao of the total failure of the expedition fitted out by the Hon. James Erskine Murray, with a view of opening a commercial communication with the island of Borneo. The expedition, consisting of the Fairy Queen and Diana schooners, had been entrapped and set upon by the Sultan Cote; but after 36 hours' continuous fighting, they made their escape with the utmost difficulty. Mr. Murray himself, with two seamen, were killed, and three were severely wounded.

UNITED STATES.—The steam-ship Britannia has arrived at Liverpool with advices from Boston to the 16th, and from Halifax to the 18th ult. The riots in Philadelphia had been renewed, but the accounts of their origin and progress are, though voluminous, so rambling and contradictory, that it is difficult to get at a real history of the transactions. It appears that on the 5th inst. a report prevailed that a number of muskets had been conveyed by the Irish Catholics to the church of St. Philippo Neri, in Queen-street. The report caused much excitement; the street was soon crowded with citizens, the sheriff and two aldermen were sent for, the building was entered, and ten or a dozen muskets were found. A committee of the citizens was subsequently appointed, and, after much consultation, the church was again entered to search for more arms. It is solemnly averred, in a document signed by the committee and an alderman, that they were met at the church-door by two Irishmen with loaded muskets and fixed bayonets. These were immediately disarmed. The party entered a room, and found 27 muskets. The priest was found officiating at the altar. He was seized, and asked if he had any arms or ammunition. He replied in the negative. They subsequently found a quantity of arms, bullets, cartridges, gunpowder, and percussion caps. The excitement increased greatly after this. Crowds poured in from all the surrounding districts, and matters appeared to be so threatening that troops filled the streets, and threatenings were heard in every quarter against the Irish party, respecting whose intentions the most absurd rumours prevailed. On Saturday the state of affairs before the church was so threatening that the military were marched to the spot. The crowd made a rush upon them, and forced them back. At length the soldiers were assailed by missiles of all descriptions, which having been borne patiently some time, the word was given to fire. The soldiers were, however, unable to obey because of the position of the sheriff's posse of police, who would have been exposed to danger. Mr. Naylor, an ex-member of the Congress, stepped forward, and exclaimed, if they would fire on their fellow-citizens, they had better commence with him. He was instantly arrested, and locked in a part of the church placed under guard. This exasperated the mob greatly, and they would have demolished the church had not some of the more prudent of them restrained their fellows. After twelve o'clock the crowd gradually and slowly diminished in numbers, until about nine o'clock on Sunday morning, when they began to increase, and threats, loud and deep, were proclaimed, that unless Mr. Naylor were released, the walls of the church should be battered down. The demand was resisted for some time, until at length two pieces of cannon were brought up near the church, one of which had been taken from the ship Venice, moored near the navy-yard, and the other from a wharf in the vicinity of the vessel. A second demand was made for his release, accompanied with a threat that if they did not give him up by 12 o'clock, the church would be fired upon. During all this time the military had possession of the church. The demand being still resisted, the pieces were drawn up in the rear of the church, in an alley running from Christian-street, and an attempt was made to discharge them, but it seemed that, owing to some water having been poured into the touch-holes, they were fired with difficulty. The infuriated mob then got a large log, which they used as a battering-ram, and with it they broke in a part of one of the doors in Queen-street. A parley then took place between the crowd and the military within the building, the former demanding that the Hibernia Greens should be dismissed. At length the request was complied with, it being understood that they should leave the church with their pieces unprimed and the pan open. From this time the vicinity of the church was a scene of wild uproar. Several attempts were made to break open the church-doors, and they at last succeeded. The windows were smashed, and the crowd immediately filled the church; but it does not appear that they did much mischief to the interior of the building. On the church being thus taken possession of, an alarm was given by the tolling of bells, and a large body of military was marched to the spot, when, some formidable demonstrations having been made by planting pieces of artillery against the doors, &c., the mob were induced to evacuate the building. The military were shortly afterwards assailed by a body of men, upon whom they fired, when several persons were killed and wounded. There were now numerous threats of vengeance against the military. The mob soon rallied in various places in the vicinity, and the news of the collision spread in all directions, of course much magnified. The mob soon obtained possession of three cannon, taken from on board two vessels lying in the river. They also had procured a considerable number of muskets and other fire-arms. The cannon were loaded with various substances; one of them with a 30-feet chain, which killed or wounded a number of the military, particularly the members of the National Artillery, a company of Native Americans. The firing with musketry was kept up briskly, and the mob took shelter in, and fired from, the houses and alleys in the vicinity upon the military, who changed their position, and were drawn up in front of St. Philip's Church, which recedes a short distance from the street. A squadron of cavalry arrived on the ground about half-past 10, and succeeded in capturing one of the guns in possession of the mob at the corner of Second and Queen streets, and one at the corner of Third and Catharine streets, which were taken to head-quarters. They were fired upon by a number of the mob, and some of them wounded. As soon as the cavalry made their appearance the rioters generally dispersed before they were charged. But few pieces were discharged after 12 o'clock. By 1 o'clock the military had entire possession of the ground. The city was placed under military rule, the soldiers daily and nightly parading the streets. By dint of the most vigorous measures tranquillity was restored; but the Authorities continued to exercise the utmost vigilance, and were in perpetual alarm of a fresh outbreak. Several of the rioters had been arrested, and examined on charges of riot, high treason, and murder.—In the midst of the Philadelphian troubles, a dreadful tragedy has been enacted by an armed mob, near Nauvoo, in Illinois. Joe Smith, the Mormon prophet, had given himself up, together with his brother and several Mormon leaders, to the law, and they were all in prison at Carthage, with Governor Ford pledged in word for their safety. Notwithstanding this, a sanguinary mob, with blackened faces, broke into the gaol and murdered, in the most cowardly manner, Joe Smith, the prophet, and his brother. The other Mormons were spared, but one who was in the cell received five gunshot wounds. The latest accounts from Nauvoo state that Governor Ford cannot restrain the armed multitude, who insist that the Mormons shall leave Illinois! The Mormons have given up their arms, and the very worst is feared.—On the 10th inst. Monte Video and its vicinity was visited by a violent tempest, called a *pampero*. The wind blew with terrible power, and the waters of the river were lashed with a fury fearful to behold. H.M.'s steamer Gorgon was driven on shore, and other vessels were much damaged.

TAHITI.—Accounts from Papeete to March 6th, have been received by H.M.S. Vindictive, 50, Captain Toup Nicolas, which arrived at Portsmouth on Friday from South America and the Pacific, having on board Mr. Pritchard, the British Consul for Tahiti, who had been forcibly expelled from that island, after having first been arrested and thrown into prison by the French Authorities there. The British Consul had not in any way committed the slightest offence against the usurpers of Queen Pomaré's authority, except affording shelter to the deposed Queen in the hour of her affliction previous to her seeking it on board one of her Majesty's ships. He was released from prison, after several days' imprisonment, at the intervention of Commander Gordon, of her Majesty's steamer, Cormorant, on the condition that he was not to be landed again on either of the Society Islands. He was not permitted to proceed to his home, but put on board the steamer at once, after she had got outside the harbour, leaving his wife and property behind him. The Cormorant sailed from Tahiti to Valparaiso, where she arrived on the 28th April. At Valparaiso Mr. Pritchard embarked on board the Vindictive, which sailed thence on the 1st May for England. It appears that, subsequently to February 5, the Protectorate grew more and more persecuting and oppressive; many of the chiefs and others of the best people favourable to the Queen were imprisoned. Queen Pomaré was herself proscribed, and compelled to take refuge in a British vessel of war of small size, and the English missionaries were marked out as the objects of peculiar hatred and vindictive annoyance. The acting governor issued a proclamation declaring the place in a state of siege. All English officers were obliged to be on board at 8 p.m. The French, after their embarkation, destroyed all English boats hauled up on the beach; and the owner of a vessel, who had just sold it to the French Government, not being able to procure any English house, was forced to reside, with his wife and her young children, in a native one; he wrote, mentioning that his wife was ill, daily expecting her confinement, and requesting he might be permitted to keep a light, but was refused. He called on the acting governor, informed him of the dangerous state of his wife, the same apathetic reply was given—that no exception could be made in his favour. A French officer, high in employ, no less a person than the Commissary-General, publicly stated, in presence of some Englishmen, that if the natives rose, and were joined by any Englishmen, he would go and with a pistol be the first man to shoot Mr. Pritchard. "A few nights afterwards," says an English officer, in a letter to the *Times*, "Mr. Pritchard left his house to go on board her Majesty's ship Cormorant, to see some of the officers; he had only a few yards to walk from his gate to the jetty. The commandant of police, who had been observed all day prowling about, ran out of the guard-house (it is the one from which the Queen's attendants had been expelled, and only a few yards off), without his hat, seized Mr. Pritchard, and hurried him off, followed by some soldiers. Immediately on hearing it, the commander of the Basilisk and myself went off to the Acting Governor, M. D'Aubigny: he refused to tell where Mr. Pritchard was confined. After some demur, he gave a paper to Lieutenant Hunt, which he also read aloud. It was of such an atrocious nature that we agreed not to mention the contents, fearing the extra alarm it would throw Mr. Pritchard's family into, and the excitement it would cause amongst the population in general. Judge of my surpise to hear this morning that it was placarded in French, English, and Tahitian on the different public places. A British subject, and he our consul and the representative of the Majesty of England, treated as a common convict, seized in the open day, in the presence of his family, hurried like a vile malefactor along the streets, jeered at by French soldiers as he was dragged in front of the barracks." The paper alluded to is as follows:—"French Establishment in Oceania. A French sentinel was attacked in the night of the 2d to the 3d of March. In reprisal I have caused to be seized one Pritchard, the only daily mover and instigator of the disturbance of the natives. His property shall be answerable for all damage occasioned to our establishments by the insurgents; and if French blood is spilt, every drop shall recoil on his head. D'AUBIGNY, Commandant Particular of the Society Islands, Papeete, March 3." For the manner in which this outrage is regarded by our own Government, we refer to our Parliamentary Report of Wednesday.

GARDENERS CHRONICLE

Parliament.

HOUSE OF LORDS.

Friday.—After disposing of the Irish Party Processions Bill, the Aliens Bill, on the motion of Lord BROUGHAM, was read a third time and passed.—The Marquess of NORMANBY, in a speech of great length and detail, then drew attention to the subject of the health of towns, and moved an address to the Crown, praying that the sanatory condition of the people, as exhibited in the results of the inquiries of the commission whose report has been recently issued, may receive the deliberate attention of Government, with the view of framing some general remedial measure, to be introduced at an early period of the next session of Parliament.—The Duke of BUCCLEUCH went over the subject, as developed by the evidence, dwelling on the magnitude of the evil, but pointing out the difficulties in the way. As an instance of this, he stated that a Bill passed for the improvement of Liverpool was inoperative, because motives of humanity prevented the exercise of the power by which twenty or thirty thousand individuals might be turned out of cellars, without any other place of refuge. The commission was diligently considering its report, which in due time would be produced, though he did not think that it would recommend the immediate adoption of any legislative measure, mature deliberation being requisite. He therefore opposed the motion, which was negatived without a division.

Monday.—The Royal assent was given by commission to the Assessed Taxes, Detached Part of Counties, District Courts and Prisons, Parish Clerks, Butter and Cheese, Colonial Postage, Soap Allowance, Sudbury Disfranchisement, Loan Societies, Actions for Gaming Discontinuance, Western Australia, and several Railway, Road, and Estate Bills. A great many Bills were forwarded a stage.—The Duke of BUCCLEUCH moved the second reading of the Metropolitan Buildings Bill.—Lord CAMPBELL moved its second reading that day three months. He objected to such a Bill being brought forward at the end of the session. It was a Bill that affected a vast amount of property in the metropolis; and all the provisions for ventilation and drainage in it were calculated rather to defeat than promote these important ends. He disapproved of its principle, because its machinery was its principle; and he was opposed to the payment of referees out of the county rate. There was also a wanton interference in it with private property—wholly unnecessary on the public. It gave the referees a power hitherto only held by the Sovereign, namely, a dispensing power.—The Earl of CADOGAN, Lord KINNAIRD, and the Marquess of SALISBURY, likewise objected to the passing of such an important Bill through Parliament at this period of the session.—Lord COTTENHAM said so difficult and important, and so contradictory in some respects were the provisions of this Bill, that it would be quite impossible at so late a period of the session to give it that consideration which was indispensable; and it was somewhat too much to call upon their lordships to sanction it by a second reading. By one clause, agreements were to be enforced between landlords and tenants, which by another part were made impossible.—The Duke of BUCCLEUCH having persisted in pressing forward the measure, their lordships divided—For the second reading, 31; against it, 8; majority, 23. The Bill was read a second time.

Tuesday.—The LORD CHANCELLOR explained the course he had pursued with respect to Lord Beaumont's Bill for repealing all the obsolete penal acts against Roman Catholics which still remain on the statute-book. He had consulted all those who were especially competent to advise with him upon the subject, and having struck out every clause against the propriety of which any reasonable doubt could be entertained, he now confidently recommended that their lordships should pass the Bill, in spite of the objections which the late period of the session had suggested. He then went on to describe the enactments which the Bill proposed to repeal, explaining their enormity and absurdity, and the hardship to which Roman Catholics would be exposed if any informer, from motives either of reward or malignity, should proceed upon them; and concluded by expressing his regret that the Bill did not go further.—The Bishop of LONDON anxiously guarded himself from the possible imputation that he was desirous of continuing these obnoxious laws for their own sake, but opposed the further progress of the Bill, on the ground which the Lord Chancellor had himself suggested—that it was not a comprehensive measure. He complained that it was pressed forward at so late a period of the session, and in the necessary absence of most of the Bishops; and, reminding their lordships that the constitution of the English Church was not only Protestant but anti-Popish, cautioned them against thus lightly and hurriedly breaking through the links of the great chain, which had been designed to maintain the Church in its supremacy. There was already a talk of "going further;" let there be no piecemeal legislation, but let a subject of such grave importance be considered at leisure, and as a whole.—Lord BROUGHAM agreed with the Lord Chancellor, but thought that the acts prohibiting communication with the see of Rome should be first repealed.—Lord WICKLOW, too, preferred that the present Bill should be passed, and the work of revision resumed next session.—Lord CAMPBELL thought that great inconvenience would result if the Bill were delayed, as, from the publicity which had been given to the obsolete penal acts, *qui tam* actions would be brought against the Roman Catholics.—Lord BEAUMONT declared his intention of persisting, and the question that the report be received was put and carried—the Bishop of LONDON saying "Non-content."—The LORD CHANCELLOR then asked the right rev. prelate if he had any amendment to propose, as, if so, the Bill should be re-committed.—The Bishop of LONDON answered that he would not interfere further in the matter.—The report was then received.—The Metropolitan Buildings Bill passed through committee, and the Railways Bill was read a second time.

Thursday.—The Earl of ABERDEEN, in answer to the Marquess of CLANRICARDE, intimated that the occurrences at Tahiti, especially the outrage against the person of the British Consul, were so gross and flagrant as to be all but incredible. The event would, doubtless, prove a Godsend to the enemies of peace between France and England; but he had no reason to doubt that the French Government would promptly disavow the unauthorised conduct of their officers at Tahiti, and not a moment had been lost in making proper representations. After some conversation, the subject dropped.—The Railways Bill was committed, after a statement from the Earl of DALHOUSIE as to its objects and nature. The Metropolitan Buildings Bill, the Poor-law Amendment Bill, and other measures were advanced; and on the third reading of the Law Courts (Ireland) Bill, a difference arose between the LORD CHANCELLOR and Lord WHARNCLIFFE, the former strongly objecting to a particular provision of the Bill, vesting in the Lord Lieutenant the inferior appointments in the law courts, instead of conferring them on the judges, as was the case in this country. He asked why Ireland was to be put on a different footing from England, and called on them to administer the same justice in the one country as in the other.—Lords CAMPBELL, and COTTENHAM, and the Marquess of CLANRICARDE, made some observations on the subject, and the debate was adjourned, in order to a consultation with the law officers of the Crown.

Friday.—The Horse Slaughtering Bill was read a second time, and the Metropolitan Buildings Bill was read a third time and passed.—The Earl of ABERDEEN, in answer to Lord BEAUMONT, said that the British Authorities at Tunis were obliged to give up a certain Maltese who recently had committed a double murder in Tunis; the Maltese had had a fair trial; the criminal had been respited by the Bey until communication on the subject should take place with the British Government at home; but he (the Earl of Aberdeen) could not recommend the criminal to mercy, and the man was executed. The Consul at Tunis did no more than his duty, and we had a right to try the criminal according to the usual custom for killing a Maltese.—The discussion was here interrupted by the Commons appearing at the bar, in order to a conference on the Process of Law (Ireland) Bill.—[Left sitting.]

HOUSE OF COMMONS.

Friday.—The discussion on the Poor Law Amendment Bill was accompanied by a general expression of belief that though the Bill in its details did not please all parties, it was nevertheless a great improvement and amelioration of the old law.—Sir J. GRAHAM wound up the discussion with a short speech, in which he admitted the fair, temperate, and assiduous manner in which the opponents of the Poor-law had acted towards the Bill, which was then read a third time and passed.—The South Wales Turnpike Trusts Bill, the Joint Stock Banks Regulation Bill, and other measures waiting for the third reading were passed. The Consolidated Fund Bill was read a second time, ordered to be committed on Monday, with notice given by Sir G. CLERK, that it be an instruction to the committee to move the usual appropriation clause. This signal of the close of the session was marked by a cheer.—The Merchant Seamen Bill, which stood for consideration in committee, was opposed, several Members expressing a wish that it should be postponed till next session. Mr. S. HERBERT, however, expressed his determination to carry the measure forward; but consented to postpone the committee on the Bill till Monday.—About 20 other Bills were advanced through different stages.

Monday.—The Merchant Seamen's Bill passed through committee. The Criminal Justice (Middlesex) Bill was read a third time and passed. The Lords' Amendments to the Farm Buildings Bill and to the Trafalgar-square Bill were agreed to, and the Art Unions Bill was read a second time.—Sir J. GRAHAM, in moving the second reading of the Charitable Donations and Bequests (Ireland) Bill, stated its nature, which is to remedy the defects of the 40 Geo. III., under which bequests and endowments for religious uses in Ireland is regulated. The first objection was the constitution of the Board of Charitable Bequests, which is still exclusively Protestant (the main portion being dignitaries of the Church), unless, since Catholic emancipation, any of the judges who are members should happen to be Roman Catholic. This is to be remedied by a re-casting of the board, by which (in addition to the *ex officio* members), out of ten commissioners to be appointed by the Crown, five are to be Roman Catholics; and all doctrinal questions arising out of Roman Catholic Bequests are to be referred to their exclusive adjudication. This removes another objection to the board, as it is at present constituted, that though exclusively Protestant, it has the discretionary power of deciding upon the expediency of a bequest for religious uses, though three-fourths of all that pass under its review are Roman Catholic. The Bill, otherwise, remedies defects in the law applicable to voluntary religious endowments; renders testamentary provision for Roman Catholic priests and chapels valid; and places Roman Catholics more on that equal ground which the act of Catholic relief contemplated. He assured the House that the measure was proposed in the spirit of peace, and as a part of that conciliatory policy which it was hoped would so compose Ireland as to enable the Queen to visit her Irish subjects, whom he eulogised as a brave and still loyal people.—Mr. M. O'FERRALL complained that the Roman Catholic bishops had not been consulted in the construction of this measure, and pointed out various objections to its details which he considered to be unsatisfactory, especially the subordination of ecclesiastics to laymen.—Lord ELIOT assured the House that the Crown, in the appointment of the five Roman Catholic commissioners, would select individuals having the confidence of the Roman Catholic body.—Mr. BELLEW complained of the solicitude manifested throughout the Bill to avoid giving the titles of the dignitaries of the Roman Catholic Church in Ireland, any of whom, if they conformed to the Protestant faith, would be eligible to elevation on the episcopal bench without fresh consecration. Not a single Roman Catholic was officially connected with the Government; and every measure of relief bore evidence that the ascendant spirit still prevailed.—The Earl of ARUNDEL and SURREY returned thanks to Government for the conciliatory spirit evinced in this Bill. He wished, however, that the bishops had been recognised in their episcopal character.—Sir R. PEEL expressed his satisfaction at the manly tone taken by Lord Arundel, and his proportionate regret at the carping spirit of other speeches; and declared the entire sincerity of the Government in their intention to benefit the Roman Catholic population by this measure. He read extracts from a work of Mr. Scully, showing the disadvantages under which Roman Catholic charities laboured in the existing state of the law; and after explaining how these disadvantages are removed by the Bill now in progress, appealed to the House whether it must not be disheartening to a Government thus earnestly exerting themselves for improvement, to be met with these ungracious comments upon their motives. He referred to the draught of a Bill relating to this subject, which was prepared under Lord Wellesley's Administration, with the concurrence of the Roman Catholic hierarchy—contrasted the present Bill favourably with that draught—and exposed the unreasonableness of the commonplace charges of "insult and injustice." He said it was objected that Roman Catholic spiritualities were not properly cognizable by any lay tribunal. But, first, the matters to be dealt with under this Bill were not spiritual at all; secondly, it did not follow that the tribunal to be constituted under this Bill would be a lay body; and, thirdly, a lay body was to have had this jurisdiction by the very draught which he had before mentioned as having been approved by the Roman Catholic hierarchy themselves. He deprecated an unfair agitation of this question during the approaching recess.—Mr. SHEIL intimated his discontent that the Roman Catholic clergy had not been consulted on this occasion. The property which was the subject of the Bill was confessedly Roman Catholic; and why then was the board by whom this Bill proposed that such property should be regulated, to be a body containing a majority of Protestants? Protestants would never take sufficiently into account the feelings, prejudices, and jealousies of the Roman Catholic population. He recommended that a Roman Catholic majority of the board should be at once appointed, and that some of them should be prelates of the Roman Catholic church. It was not fit that Protestants should regulate the colleges by which Roman Catholic professors and pastors were to be appointed.—Lord STANLEY said, that Government, in introducing this measure, had had in view no religious controversy, but solely the best mode of amending an imperfect law; since this indeed was a question of law and of property, and not of religion. He objected to fetter the discretion of the Crown by any exactly fixed proportions. The composition of the board under the existing law was much less favourable than under the proposed Bill. He referred largely to Mr. O'Connell's evidence in 1829, as justifying the principle of this measure. He denounced the injustice of throwing out against eminent Judges, Protestant or Catholic, an imputation that their creed would warp their decrees; and he deprecated the discussion of the measure in a sectarian spirit.—Mr. WYSE objected to the proposed constitution of the board, and complained that the Roman Catholic clergy had not been consulted by the Government.—Mr. HUME thought the proposed tribunal a fair and proper one, such as no man ought to object to. The Bill seemed to him to be framed in a spirit of peace; and he wished all the Irish grievances were met in the same feeling. To oppose the second reading of such a Bill was not the way to get those grievances redressed. He should be glad to see as good a tribunal for the administration of English charities: there ought to be "justice to England."—Colonel RAWDON supported the Bill, and Mr. D. BROWNE pressed for its postponement.—A division was called for, when the second reading of the Bill was carried by 71 to 5.—On the motion that the Bill be committed, Mr. M. J. O'CONNELL renewed the complaint about the non-recognition of the bishops, which he could ascribe only to a truckling of the Government before the remnant of a contemptible and bigoted party. He considered the Bill in several of its details, and gave notice that he should move amendments in committee.

Tuesday.—About 20 Bills were forwarded a stage without a word of discussion.—Mr. HUME moved a resolution for taking into early consideration, in the next session, the situation of the coopering trade. His object was to obtain a reduction of the import duty on the wood from which staves are manufactured.—Mr. GLADSTONE opposed the motion; and Mr. HUME was understood to withdraw it, though not without animadversion upon the injury done to our manufactures by charging raw materials with heavy import duties.—Lord LINCOLN asked leave to bring in a Bill for forming an embankment on the Middlesex side of the Thames, between Westminster and Blackfriars. He did not mean to press it further in this session; but he wished to print it, in order that it might be understood before the re-assembling of Parliament by those whose interests it might affect.—Sir C. BURRELL, Mr. HUTT, and Mr. HUME, declared their intention to oppose it. They objected to a measure of which it was understood that the Government intended to defray the expense by a tax upon coal.—Mr. HUME went still further, and declared that even if there were 3,000,000*l.* surplus in the Treasury, he would oppose an embankment of this kind, as likely to injure the bed of the river.—Sir F. TRENCH detailed the advantages of his plan for the embankment of the Thames, which, in addition to other projects of architectural display, has the merit of contemplating a railroad, the profits of which he calculates will defray all expenses of erection and maintenance, and thus obviate any tax, whether on coals or anything else. He invited Mr. Hume, whose powers of calculation commanded his respect, rigidly to test the figures on which the plan was based. Leave was ultimately given to bring in the Bill.—Mr. MACKINNON drew attention to the practice of interment within large towns, and in churches and chapels.—Sir J. GRAHAM saw great difficulties in the way of any general legislative enactment on the subject, and could not pledge himself to bring in a Bill next session.—Mr. BORTHWICK, in a short speech, moved for copies of the correspondence which has passed between Don Carlos and the Government, relative to certain propositions made with a view to the tranquillisation of Spain; and also copies of the correspondence between the British, French, and Spanish Governments on the same subject. — The CHANCELLOR of the EXCHEQUER said that the House had already received all the information required, and objected to the production of the documents.—Mr. BORTHWICK complained of the injustice done to Don Carlos by the refusal to produce the correspondence.—On a division there were two for the motion, 33 against it, which with the tellers and the Speaker made exactly "a House."—Mr. WYSE drew attention to the petitions from artists and friends of art in London and Dublin, praying for the establishment of a gallery for the reception of the best works in sculpture, or of casts from them, from the earliest period of art to the present. He moved an address to the Crown on the subject.—Colonel RAWDON and Dr. BOWRING supported the motion.—Mr. WYSE, in answer to a question from Mr. ESCOTT, stated that the commission of which he is a member had not irrevocably bound itself to accept the designs of the artists selected for the decoration of the new Houses of Parliament.—Sir T. FREMANTLE objected to the motion of Mr. Wyse, on account of the lateness of the session, and the then state of the House, which was not prepared for the consideration of such a subject.—Mr. WYSE, on the recommendation of Lord ELIOT and Mr. HUME, withdrew his amendment, promising to bring it forward next session, in conjunction with a gallery for the preservation of national monuments.—On the next motion, which was for a return of Slave-trade papers, the House was "counted out."

Wednesday.—The House met at 12 o'clock, and sat for about half-an-hour, forwarding various Bills.—At the five o'clock sitting, Sir C. NAPIER said he wished to put a question to the right Hon. Baronet opposite, of great importance to the character and reputation of this country. He had not given notice of his intention to put the question, but it referred to a matter of such public notoriety that he hoped the right hon. Baronet would be able to give him an answer. The question he had to put was, Whether it was true that the British Consul at Otaheite had been arrested under the name of "the man Pritchard," by the French authorities; whether the lights of the English residents were obliged to be put out at eight in the evening by the orders of the French; whether the French had established strong fortifications there; and whether, in consequence of these operations, Queen Pomaré had been obliged to take refuge on board a British ship? He also wished to ask whether, at the time these operations were going on, there was a British force at the island, and if so, to what extent? (Loud cries of "Hear, hear," from both sides of the House.)—Sir R. PEEL said—"Sir, although the hon. and gallant Officer has not given me notice of the question, yet two other hon. Members, the noble Lord the Member for Dorsetshire, and the hon. Member for Evesham, have notified to me that it was their intention to put a question of a similar nature to that of the gallant Officer. They will perhaps excuse me if I take the opportunity of answering my noble Friend and the hon. Member in the reply I give to the gallant Officer. In doing so I must limit myself to the statement of those facts which are of most importance. Among these is the removal of the British Consul. We have received accounts from Otaheite, and presuming on the accuracy of these accounts, which I have no reason to call in question, I do not hesitate to say that a gross outrage, accompanied by a gross indignity, has been committed. (Loud cries of Hear, hear). Her Majesty's Government received information to this effect on Monday last, and we have taken the first opportunity of making those communications to the French Government, which we considered the circumstances of the case required. (Cheers from both sides of the House.) The outrage was committed by a person in temporary authority at Otaheite, and from what we know of the facts it was not committed in consequence of any authority given him by the French Government. Presuming that the accounts are accurate, I apprehend that the French Government will at once make such a reparation as we think this country has a right to require. I trust I shall not be pressed for any further information on the subject.—Sir C. NAPIER said there was one part of his question which the right hon. Baronet had not answered—Whether a proper force was stationed at Otaheite at the time, and whether the French had established fortifications on the island?—Sir R. PEEL said he had given the gallant officer all the explanation he could conveniently give at present.—Lord INGESTRE called attention to Capt. Warner's Brighton experiment, which was either a gross imposition, or else demonstrative of the possession of some formidable destructive power, the exclusive possession of which would be of vast importance to this country. The latter was his belief, which ridicule would not restrain him from avowing. All great inventions—gunpowder, steam, and so forth—were matters for incredulity before their powers were developed. He gave a sketch of the negotiations, investigations, and experiments which have been undertaken, in relation to Capt. Warner's invention, under the Government of Lord Melbourne, and that of the present, the great object being to secure the inviolability of the secret. The Board of Admiralty, like all boards, treated the matter with indifference, neglect, and contempt; Lord Melbourne was dilatory, Sir R. Peel polite; the friends of Capt. Warner were referred from one department to another; and the commission to which the matter was intrusted required experiments which involved too much expense and disclosure, as well as leaving the question of remuneration without a sufficient guarantee. At first Capt. Warner had asked 400,000*l.* as the value of his *two* inventions, but he had subsequently offered to refer it to arbitration, being satisfied that Sir R. Peel would not act unjustly on proof of the value and importance of his discoveries. By the liberality of private individuals he had been enabled to make experiments, ending in the decisive one off Brighton; and, however destructive the

power thus evinced, its possession by this country would be a preventive of war. Brighton, for instance, could be easily reduced to ashes, but Capt. Warner, with a steamer, could set at defiance any approaching hostile fleet. He moved for the production of the correspondence between Capt. Warner and the Government.—Sir R. PEEL seconded the motion, being determined that the public should be in possession of the whole correspondence, and be enabled to judge whether or not the Government had not offered every reasonable means and facility for testing the value of the discovery. He acquitted the late Ministry of any blame in this matter, and stated what had passed since the accession of the present. Capt. Warner had professed to possess two destructive powers—the invisible shell and the long range. By the long range, Capt. Warner had said that he could, with a single ship, have demolished Algiers. Sir R. Peel had offered to appoint two or three competent professional judges, who should not ask for either secret, but should ascertain its operation, and the probability of its remaining a secret. He had proposed, that then the Government should have the power of deciding how much it was worth; but he had certainly refused to pledge the Government that Capt. Warner should receive a sum if the Brighton ship were successfully blown up. The Commissioners appointed on the part of the Government had informed Capt. Warner that he should have every facility as soon as he had supplied an estimate of the expense; the Government being quite willing to defray it within reasonable limits. Capt. Warner, however, wished to avoid any such trial, on the ground that Sir R. Peel himself, and other Ministers, had witnessed one of his experiments at Wanstead, and were satisfied of its success; but the Commissioners said they were directed to form a judgment for themselves, not to rest on the opinions of public functionaries. It was not till after repeated demands of large sums by way of remuneration that Capt. Warner at last expressed a willingness to take whatever Sir R. Peel should award, and then stated to the Commissioners that he had sunk two French privateers with his invisible shell toward the end of the war. No record, however, no trace, could be found of this extraordinary transaction. With the long range he said he had destroyed rocks in the islands off Vigo Bay, at six miles' distance. This experiment the Government desired to see repeated, for which several thousand pounds were asked by Capt. Warner; but the Government were not content to hazard more than 500*l.* for a beginning. It was said by Capt. Warner to be necessary that in every fleet there should be one man acquainted with the secret; but if the secret was worth 400,000*l.* to a foreign Government, what security was there that some of the men thus intrusted would not betray it? Capt. Warner's only answer to that argument was, that no Englishman would betray his country. No disrespect had been shown to Capt. Warner; every opportunity had been offered to him; and if there was a failure, with Captain Warner the blame of it must rest. — Mr. W. COWPER, who had been private secretary to Lord Melbourne, justified the conduct of the late Ministry; and remarked that in their time, as now, Capt. Warner always applied rather to the monied than to the scientific departments of the Government—always wanted to have his discoveries bought before they were tested. He had tried the Prussian Government in the same way, and failed on the same ground.—Sir H. DOUGLAS stated the opinion of scientific men to be, that the only valuable discovery was the long range. The invisible shell could not be used, because nobody could ever get near enough to the fleet it was to be used against. It was the old difficulty of getting the salt on the sparrow's tail. The Commissioners, however, had expressed themselves willing that a vessel should be furnished for Capt. Warner to destroy; but they required that she should be a vessel which he had never seen, that she should be placed in a situation selected by the Commissioners, and that he should not be allowed previously to approach her. That negotiation came to a close in consequence of the refusal of the Government to guarantee a certain definite sum.—Sir C. NAPIER ridiculed the invention as wild and absurd. Sir T. Hardy and Sir R. Keates, who were represented as approving it, were both dead. There had been a similar experiment in 1805, which had cost 20,000*l.*, and ended in nothing.—Mr. AGLIONBY said that the failure of that experiment was no reason why this should be a failure also. The subject ought not to be laughed out of the House.—Mr. BROTHERTON doubted the policy of encouraging such inventions. Capt. Warner had undertaken to destroy a battery in Portugal; opportunities and materials had been provided to him, but he went on from week to week, and did nothing. When future generations should read the debates of these days about engines of destruction, their opinion would be that ours was not a very sensible age.—Mr. WAKLEY thought the Government had acted rightly. Let an experiment be tried upon a ship with which Capt. Warner had not been in communication; and if he blew her up, no doubt there would be a universal demand for further investigation.— Sir G. COCKBURN had received a report from an artillery officer who had been appointed to watch the Brighton experiment, and was assured that the explosion was produced by some force, like nitrate of silver, or others known to chemists, but which required contact and management, and, therefore, useless in active service against an enemy. The Government would reward the inventor of a useful and serviceable projectile.—Lord INGESTRE re-asserted that the Brighton experiment was a *bonâ fide* one, and renewed the expression of his confidence in Capt. Warner's destructive powers.—The motion for the production of the correspondence was then agreed to.—The Insolvent Debtors Bill was then read a second time.—Mr. M. GIBSON moved that the petition of Mr. Heathcote, late sub inspector of factories, complaining of having been unjustly dismissed from his office, be taken into consideration. An anonymous letter having been written to Mr. Ferrand, in which the secrets of the factory commissioners were let out, Mr. Heathcote was accused by the Government of having written it, and on this ground had been dismissed.—Sir J. GRAHAM justified his dismissal on the grounds that the writing of the anonymous letter bore the strongest resemblance to Mr. Heathcote's, that the paper and ink were of the same description, and that other collateral evidences of identity amounted to proof positive that Mr. Heathcote was the writer. Although that gentleman denied his having done so, and though his nephew came forward and professed himself to be the writer, Sir J. Graham still asserted his belief that the anonymous letter was the letter of Mr. Heathcote. He opposed the motion.—On a division there were—For the motion, 16; Against it, 23; Majority, 7.—The Art Unions Bill passed through committee.

Thursday.—The House met at 12 o'clock, and was busily occupied, during a long sitting, in the discussion and advancement of routine business. The most important of the measures discussed was the Charitable Donations and Bequest (Ireland) Bill, in which sundry amendments have been admitted by Government, with a view to conciliate those who were opposed to it in its original shape. The principal of these was the introduction of the names of Roman Catholic archbishops and bishops. The Bill was advanced as far as the 19th clause.—On the motion of Sir R. PEEL, the Penal Acts Repeal Bill was read a first time.

Friday.—A new writ was ordered for Dudley, in the room of Mr. Hawkes, who has accepted the Chiltern Hundreds. The House went into Committee on the Insolvent Debtors' Bill. After a long discussion on the several clauses, all the clauses were agreed to, and the House resumed. The report was received, and the Bill ordered to be committed on Monday.—(Left sitting.)

CITY.

Money Market, Friday. — Consols for account closed at 99⅞. Red. Three per Cents. 100; Three-and-half per Cents. 103; New Three-and-half 101¾; Bank Stock 199¾; Exchequer Bills 76*s.* to 78*s.* prem.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. WILLIS, Spring-street, Portman square, greengrocer—C. BAND, March, Cambridgeshire, leatherseller—A. TREGEAR and T. C. LEWIS, Cheapside, musicsellers—E. WALKER, Newman street, Oxford-street, auctioneer—B. BRIGHT, Wigmore-street, Marylebone, victualler—E. HERON, Northumberland, shipowner—J. HERON, Northumberland, shipowner—J. ANDREW, Maryport, Cumberland, banker—W. WYRILL, Bradford, ironmonger—W. MAY, Liverpool, spirit merchant—T. KEMP and R. DAVIES, Aston, builders.

SCOTCH SEQUESTRATION.—A. MACARTER, Edinburgh, agent.

Metropolis and its Vicinity.

Representation of Middlesex.—It is understood that in consequence of the disfranchisement of Sudbury, a large number of electors of this county are anxious to obtain two additional members. The metropolitan county at present only returns two members, while Surrey, Kent, &c., return each four. It is therefore proposed that the parishes of Kensington, Chelsea, Hammersmith, Fulham, and Chiswick, which contain a population of upwards of 140,000 inhabitants, shall be formed into a borough, to return two members. Another suggestion is, that Middlesex shall, like Surrey, be divided into two divisions—East Middlesex and West Middlesex, each to return two members; but the latter suggestion does not appear to meet with the support of a large body of the inhabitants of the parishes above-named, who will in that case, by the right of voting being still confined to freeholders only, be disfranchised. Meetings are about to be called at Kensington, Chelsea, Hammersmith, Fulham, and Chiswick, to adopt measures to obtain a charter as a borough without delay.

River Steamers.—On Saturday, at the weekly meeting of the Committee of Aldermen, the members of the Navigation Committee and the Watermen's Company presented, in compliance with a recommendation from the Lord Mayor, a copy of by-laws and rules for the future regulation of the numerous steam-boats on the river. The alterations proposed are, that in future no steam-boat is to carry beyond a certain number of passengers, according to its tonnage, and that proper persons are to be appointed to see that the regulation is not violated; and also that no boat is to be permitted to go beyond a certain rate of speed, and the places of embarkation are to be upon a secure and uniform footing. It has been stated that on Sunday week one of the Star Company's boats left Gravesend with 1300 passengers, one of the Blackwall Railway boats with 1300, and one of the Diamond boats with upwards of 1550 passengers.

Westminster Bridge.—The following is the report of the Select Committee appointed to inquire into the present state of Westminster-bridge, and into the expediency of continuing the present expenditure thereon, or of erecting a new bridge on or near the site thereof, and also into the amount of the bridge estates, and the liabilities thereon; with power to report their opinion, together with the minutes of evidence taken before them to the House:—"That on a review of the whole of the evidence, no case has been made out to justify the committee in recommending to the House the pulling down the present bridge and the constructing a new one. That it is desirable that the inclination of the roadway over the bridge be improved by lowering its summit and raising its extremities. That the parapets be lowered as much as practicable and consistent with safety."

City Improvements.—The Commissioners of Sewers for the City have given directions for making a sewer in Moor-lane, Cripplegate, preparatory to a new street being formed, which it is intended to lead to Islington, passing by the Eagle Tavern, across Shepherd-and-Shepherdess fields. This spacious area is already marked out for the intended buildings. Several houses will be removed between Moor-lane and Chiswell-street for the thoroughfare, which, when completed, will open a new line of road from Southwark Bridge and Cheapside to Islington. A new church will also be built on the line in Moor-lane, for which purpose the old workhouse of the parish of Cripplegate will be taken down. In a few days workmen, under the direction of the commissioners, will prepare the foundation in the open space between King William-street, Gracechurch-street, and London Bridge for the erection of Mr. Nixon's statue of William the Fourth, which has been completed at the expense of the Corporation of the City of London and the Commissioners of Sewers. The statue will be 18 feet high, and be chiselled out of two blocks of granite, weighing 45 tons; the largest block weighed 30 tons, and required 22 horses to bring it to the yard. The pedestal will be 22 feet high, of a circular form.

British Museum.—The King's or Royal Library in the British Museum is undergoing a complete renovation, and not before it was wanted. It was dingy in the extreme, nothing having been done to it since it was first built, 16 or 17 years ago. The first portion of the Xanthian marbles which were discovered by Mr. Fellowes, in the survey of the extensive ruins on the banks of the Xanthus, in Asia Minor, have arrived at the Museum. It was brought to town several days ago in waggons from Portsmouth. The cases, each of which weighed some hundred weight, have been opened under the superintendence of Mr. Hawkins, with great care and attention. The marbles will be placed in the new building, the western wing, which is now erecting, but which is not expected to be completed for a twelvemonth.

Booksellers' Provident Retreat.—Mr. John Dickenson, the paper-maker of the Old Bailey, has with great liberality given a plot of ground, about three acres in extent, situated on his estate, in Hertfordshire, to this institution. The ground lies between King's Langley and Abbott's Langley, and is well situated for the houses which the committee intend to build for decayed booksellers, their widows, and assistants.

The Duke of Sussex's Library.—On Saturday took place, at Evans's, the twenty-fourth and last day's sale of the first, or Theological part of the library of the late Duke of Sussex. The proceeds of the twenty-five days' sale are 8308*l.* 4*s.* The whole library, on the valuation of it preparatory to it being offered to the government, agreeably to the Duke's will, to be purchased for the nation, was under 16,000*l.* The next portion of the library to be brought to the hammer will be the manuscripts, consisting of early copies of the Old and New Testament, and portions thereof. That sale consists of 510 lots, and will occupy four days.

Statue of the Duke of Sussex.—The model from which the marble statue of the Duke of Sussex, which will be erected in Freemasons' Hall, has been completed by Mr. Baily, R.A., is now in his *studio*, in Percy-street. It represents the late Grand Master with the decorations of the Garter and the Bath, and in the robes of a knight; this gives a dignity to the figure which modern costume alone could not have conferred, and is better than the adoption of Roman or Greek draperies, which would have been inconsistent and incongruous. The figure is of heroic size, standing about seven feet and a half in height. The great merit is the happy representation of character. The features and attitude, are expressive of the character of the original, and, as far as portraiture is concerned, the likeness is considered perfect.

The Nelson Dinner.—A general meeting of the subscribers to the proposed dinner in Trafalgar-square was held on Thursday, Sir E. Codrington in the chair, when it was resolved that as Lord Lincoln will not allow the festival to take place in the square, the money subscribed, amounting to about 300*l.*, be distributed among the families of those veterans of Greenwich Hospital who were to have attended the dinner, and that the sailors themselves receive each a medal struck for the occasion.

Sale of Egyptian Hall, Piccadilly.—The auction room at Garraway's was much crowded on Friday, in consequence of the announcement of the sale by auction of the above premises, which were erected about thirty years since by Mr. Robinson, the architect, for Bullock's Museum, but have since been used for different exhibitions. The property is leasehold, having an unexpired term of twenty-eight years from Midsummer last, at a ground-rent of 300*l.* per annum, which, with the land-tax and rates, would amount to the annual rent of 413*l.* From the statement of the auctioneers, it appeared that the premises realised a net rental of 1100*l.* per annum, after paying the ground-rent, rates, and taxes, and that, from a moderate calculation of the net rental, the property would be worth, for the twenty-eight years' purchase of the lease at six per cent., 14,850*l.* The sale commenced by a bidding of 3000*l.*, but the Hall was eventually bought in for 6250*l.* It was stated by the auctioneer that the exhibition of General Tom Thumb realised at times as much as 125*l.* per day, and that 44*l.* per month was paid for the use of the exhibition room.

New Infant Orphan Asylum.—On Monday, the first election of children into this charity, established for the support and education of fatherless children, "on liberal and not exclusive principles," took place at the Hall of Commerce. Mr. John Wilson presided, and congratulated the meeting on the favourable state of the society's affairs. Dr. Reid then announced that the poll had commenced. The election was carried on with much spirit until 2 o'clock, when five children were chosen from a list of eighteen approved candidates.

The Surrey Tolls.—On Thursday the Act of Parliament authorising the collection of tolls at the different gates in the Surrey New Roads, comprising the Marsh gate, Circus gate, King's Arms gate, &c., ceased from operation, and the gates, which have been so long a source of discontent, will at once be razed to the ground.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending July 27th.—West Districts, 160; Northern, 210; Central, 189; Eastern, 246; Southern 261; Total, 1066. Weekly average for the last five years, 946.

Provincial News.

The Harvest.—The reports in the provincial papers show that the harvest has commenced very generally in the South of England, and even the spring crops, such as Oats and Barley, have turned out better than was expected. Some winter-sown Oats have proved very productive, and the crop has been already housed in some places in excellent condition. Where the harvest is not commenced, the late fine weather has advanced the crops so rapidly, that the utmost exertions of the husbandman and the employment of all the hands he can command, will be required to gather it speedily in.

Ashton.—The towns of Ashton, Hyde, and Glossop, have recently been the scene of several extensive burglaries, as have also several farmhouses and roadside public-houses in the vicinity. This gang of housebreakers have hitherto escaped the police, and, singular enough, they turn out to be four brothers of the name of Swan, all residing with their mother and sister at Staleybridge, both of whom have been kept in a plentiful supply of the comforts of life by the thievery of the sons. Although they were a family of indifferent character, no suspicion was attached to them as being the perpetrators of so many robberies. The deputy-constable of Ashton, however, lately received information which led to the apprehension of the whole family, and on Saturday they were brought before the magistrates at Ashton-under-Line. There were several cases of a most daring character proved against them, and there are many others for which the evidence was not complete.

Birmingham.—On Thursday week an extensive robbery was committed at the Birmingham Town and District Bank, by a young man named Stanley Warner,

respectably connected, who had been employed in the cashier's department, and absconded with a large sum of money. It appears that on Thursdays it has been his practice to go to dinner between two and three o'clock, and as usual he left for that purpose without any particular notice being taken of his departure. The clerks, however, finding he did not return at the usual time, began to wonder at the cause of his delay, and it was almost instantly discovered that twelve 100*l.* notes were missing from a drawer to which Warner had access. Inquiries were immediately set on foot respecting him at his residence, but no information could be obtained, and the police were instantly sent in search. He was traced to Shrewsbury, and thence to Chester, where he was apprehended in a state of intoxication, with 1160*l.* in his possession. It would seem that he had been drinking constantly from the time he left Birmingham until taken into custody.—On Monday week, Mr. Hampton, the aeronaut, who about five years since made perilous descents in a parachute at Chelsea and Cheltenham, ascended from the Vauxhall-gardens in this town, in a new balloon. The machine, which is the sole invention of Mr. Hampton, has been constructed in an entirely novel manner, both with respect to the valve, shape, and car; the silk of which it is composed, amounting to several thousand yards, is manufactured by Spitalfields weavers. It is nearly the size of the great Nassau balloon, being 67 feet in height, 124 feet in circumference, calculated to contain about 24,000 cubic feet of gas; the car, which is capable of holding six persons, being five feet in diameter and of a circular form. Considerable disappointment was caused as the time drew nigh for its inflation, for, by that period, the machine was found not to be one-third inflated, and the gas was of so inferior a description, that it had only ascending power enough to take up the aeronaut himself, so that no one could accompany him. The atmosphere being very clear, the ascent was beautiful in the extreme, and after the aeronaut had gained an altitude of two miles, he effected an easy and safe descent at Shear's-hill, near Wolverhampton.

Brighton.—On Tuesday morning a stiff breeze sprung up, and the sea was considerably agitated, and in the course of the afternoon the hull of the John o' Gaunt, the vessel destroyed by Captain Warner, was seen drifting with the wind. Hundreds of persons followed its progress down channel, and a large portion of the devoted vessel drifted just off the Chain-pier, and went on shore. Thousands of persons were on the beach, anxiously waiting to examine the hull of the ship, which was so perfect a wreck that the timbers were completely separated. Capt. Pechell's fears respecting the danger to vessels going down Channel are now, of course, removed.—Captain Warner has addressed a letter to the *Morning Chronicle*, in answer to some observations of a Brighton paper, on the information of some Shoreham pilots, which the editor of that paper thinks are "calculated to throw a suspicion upon the genuine character of his experiment." A Mr. Young, he says, "a well-known and respectable inhabitant of Shoreham, went on board the John o' Gaunt, from which no person was excluded, as soon as she arrived in Shoreham Roads, and remarked a quantity of new warp (a rope about three inches round) lying on the deck, and wondered what the rope could be for. This mysterious rope was simply a coil, consisting of two new tow-ropes, for the purpose of towing the ship. Other ropes, which seem to have perplexed these Shoreham visitors, were merely guy-ropes, for conducting the large or tow-ropes on board the steamer; others were man-ropes, hanging over the sides for the more convenient escape of the crew; and I dare say there were ropes towing overboard both ahead and astern, as will happen in slovenly ships; and the John o' Gaunt was slovenly enough I dare say; though I pledge you my honour I never was on board her from the time she left Gravesend, ten days before." Captain Warner in conclusion says, "This visit proves one thing at any rate—that every one was not excluded from the John o' Gaunt, one of the many false assertions under which I am for the present doomed to labour. I perceive many of the correspondents of the public journals suggest a variety of methods and materials by which my experiment off Brighton might easily, without any difficulty whatever—to adopt their own phrase—be performed. I invite these gentlemen to go and do likewise."

Cambridge.—The Consistory Court of Ely have decided in favour of the stone altar and credence-table placed in the church of the Holy Sepulchre, Cambridge, against which the Rev. Mr. Faulkner, the vicar, had appealed, as a Puseyite innovation. The church has recently been restored under the direction of the Cambridge Camden Society, which had sanctioned the stone altar and credence-table.

Chester.—The body of the late Mr. W. Brown, who was drowned at the late Eastham regatta, was found on Ince Bank, near Runcorn, on Tuesday week. An inquest was held on the body on the same day, and a verdict of "Accidentally Drowned" returned.

Eton.—The arrangements for the distribution of prizes, to the amount of 50*l.*, given annually by Prince Albert for the promotion of the study of modern languages, have just been completed. The examinations this year will be in French and Italian, and will take place immediately after the return from the vacation of the 6th form. The provost and head master have determined to dispose of Prince Albert's gift as follows.—To the best French and Italian scholar, 25*l.*, in money, and 15*l.* in books; and 10*l.* in books to the second in point of merit. The examiners appointed by the college are—in French, M. de Vericour; and in Italian, Signor Panizzi, Librarian of the British Museum.—The annual speeches and banquet on Election Monday took place on Monday, in the presence of a great number of visitors. The number of boys now in the college list is 751, being 38 more than at the election last year; and showing an increase since 1835 (when the school numbered 446) of upwards of 300. Drake, K.S., the captain of the school (who had Montem this year, and who also obtained the Newcastle scholarship), and Brocklebank, K.S., have just succeeded to King's College, Cambridge; the intelligence of the resignation of the Rev. Messrs. Hervey and Denton, to cause the vacancies, only reached Eton on Monday morning.

Gravesend.—On Monday, during the sitting of the magistrates at Rochester, Richard Dadd, the parricide, arrived in custody of the police officers, who were sent to France by the Secretary of State. The prisoner was confined in a lunatic asylum at Clermont, about 30 miles from Beauvais, which place they left on Friday morning. He was pinioned by the arms, and wore a large military blue cloak. He had rather a lengthened beard, and hair over his upper lip. On his entering the office there was a visible wildness of expression in his face, and his eyes wandered over the whole court. After the usual forms had been gone through, he was remanded to Maidstone Gaol for further examination a week hence.—On Friday last the Rev. G. Harris, a clergyman attached to one of the city churches, who had been residing a short time at Gravesend, committed suicide by cutting his throat with a razor. He had for some months been in a desponding state of health, and the jury at the inquest returned a verdict of Temporary Insanity.

Leeds.—The local papers state that the new society instituted in this town under the name of "Odd Fellows" is rapidly increasing in importance. At the Selby anniversary last week, where the Rev. Dr. Hook preached, himself a brother and warm friend of the order, it was stated after dinner, in his presence and with his concurrence, that the funds of the order consisted of upwards of one million of money, the supposed annual income 230,000*l.* The increase of members for the last year was 25,000.

Liverpool.—On Sunday morning a tailor named Owen Leonard, who keeps a low lodging house in Peter-street, murdered his wife by cutting her throat with a razor. The murder took place in the presence of their son, and is said to have been the result of jealousy. Both parties were Irish, and lived unhappily together. An inquest has since been held, and a verdict of Wilful Murder returned against the prisoner, who has been commited for trial.

Nottingham.—A prize-fight took place at Merry's Close, near this town, last week, between a man named Cumberpatch and another named Fitzhugh, in which the latter received such injuries that he died in a few hours. The father of deceased was present, and was one of the chief instigators of the fight. An inquest has been held, and a verdict of Wilful Murder returned against all the parties concerned.

Plymouth.—At a court-martial on board the St. Vincent, 120, in Plymouth Sound, on Wednesday, Admiral Sir D. Milne, Bart., Commander-in-Chief, President, a private marine named Joseph Noble, was found guilty of stabbing Mr. Protheroe, a Midshipman of the Madagascar, and sentenced to be hanged at the yard-arm of one of her Majesty's ships. The prisoner, however, was recommended to the merciful consideration of the Crown, on account of the good character given him by the witnesses, and also because there are no serious results from the assault, which was committed in a moment of great excitement.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3117*l.*; Bristol and Gloucester, 987*l.*; Eastern Counties, 5204*l.*; Edinburgh and Glasgow, 2570*l.*; Great Western, 18,461*l.*; Grand Junction, 9774*l.*; Glasgow, Paisley, and Ayr, 1585*l.*; Great North of England, 1762*l.*; London and Birmingham, 19,641*l.*; South Western, 8530*l.*; Blackwall, 1653*l.*; Greenwich, 938*l.*; Brighton, 4863*l.*; Croydon, 609*l.*; Liverpool and Manchester, 6242*l.*; Manchester, Leeds, and Hull, associated, 7962*l.*; Midland, 10,112*l.*; Manchester and Birmingham, 3273*l.*; Newcastle and Carlisle, 1900*l.*; Newcastle and Darlington, 730*l.*; South-Eastern and Dover, 5403*l.*; Sheffield and Manchester, 582*l.*; York and North Midland, with Leeds and Selby, 3072*l.*—A special meeting of the Liverpool and Manchester Company was held last week. The report recommended a dividend of 5*l.* per share for the half-year ending the 30th June, and called attention to a project for a new issue of shares. They set forth the expediency of liquidating their debt of 454,055*l.*, and at the same time stated, that although the dividends have been at the nominal rate of 10 per cent. per annum, this has only been on an incomplete share-capital, and not on the company's outlay and expenditure. This outlay having been materially increased by the recent construction of the extension line, the annual sum to be divided would in fact be only 7½ per cent. on expenditure and liabilities, though it would be 10 per cent. on the incomplete capital, so that an erroneous impression might be made. The plan proposed by the directors is the creation of 40*l.* shares, and the appropriation of these to the shareholders in the proportion of one 40*l.* share to every 100*l.* share. The acceptance of an offer by the Bolton and Leigh Company to unite their interest, on the principle of three of their shares being deemed equivalent to one Liverpool and Manchester, was also recommended in the report, which was unanimously confirmed.—At a special general meeting of the South Eastern Company, held last week, resolutions were passed empowering the directors to borrow 133,000*l.* on mortgage, to make a branch from the vicinity of Ashford to Canterbury, Ramsgate, and Margate, and to join the Canterbury and Whitstable Railway; and also empowering them to raise 600,000*l.* on mortgage under the act for completing the branch railway and the approach to Folkestone harbour, and to effect certain alterations and extensions of the works of the Maidstone branch. A plan for a steam-boat company connected with this railway was laid before the meeting, though it cannot be regularly discussed till September. The proposition is to create steam-boat shares of 3*l.* each to the number of 42,000, those persons alone being entitled to take the shares who hold ten shares in the railway. It was also announced that the directors intend to carry a branch from Tunbridge to Tunbridge Wells.—Among the recent alterations in railway arrangements, the South Western Railway Company's trains to Hampton Court now stop at Kingston, instead of Esher. The extraordinary extension of building in the neighbourhood of Kingston would scarcely be credited by those who have not visited it of late—indeed it has become by far the most important station on the line; the number of passengers during the past year being upwards of 150,000.—Preparations are making, prior to the commencement of cutting the intended line of railway between Lancaster and Carlisle. A number of excavators are now at work in the neighbourhood of Shap, removing walls and fences, making roads, and clearing away all obstruction in the direction of the line. As soon as the crops are got off the ground, the cutting will be in active operation in the vicinity of Kendal.—The works of the South-Devon Railway will soon be in full action; Mr. Brunel has been daily employed with a great number of men in obtaining the necessary information, preparatory to the contracts being advertised. The specifications are nearly ready, and in the course of a week the public notices will be issued. At Dawlish-beach the soundings for the foundation have been ascertained by Mr. Brunel, and have been in some instances about 17 feet, and at other places a much less depth than was at first imagined. It is considered certain that the line to Newton will be completed within 12 months, and to Plymouth within two years. The latter is not however so certain, as unforeseen contingencies may arise as the works are in progress. At all events the line will be completed to Plymouth as soon as the tunnels can be finished. Everything appertaining to the line is progressing favourably, and it is arranged that a public meeting of shareholders shall take place in Plymouth about the end of August.

IRELAND.

Dublin.—Lord Heytesbury, the new Lord-Lieutenant, arrived in Dublin on Saturday, and was received with the usual honours. His Excellency landed at Kingston Harbour and proceeded to Dublin by the railway. On his arrival at the terminus he was met by the mayor and corporation, who delivered up the keys of the city with the usual forms. Upon his arrival at the Castle, Lord Heytesbury was conducted to the Presence Chamber, where the Lords Justices received his lordship. The noble lord was subsequently conducted to the Council Chamber, where, after the letters patent had been read, the oath of chief governor was administered to his lordship by the Archbishop of Dublin, authorised for that purpose by a commission under the great seal of Ireland, and then the usual oaths were administered to his lordship by the Clerk of the Council, the Privy Councillors being uncovered during the administration of the oaths. After the ceremonial of swearing-in had been gone through, his Excellency held an undress levee.—The rumour current for the last few days respecting the resignation of Mr. Lucas from the post of under-secretary is stated to be quite true, and that he now merely holds office pending the appointment of his successor.—The prayer for Mr. O'Connell and his fellow-prisoners, and for the prosperity of the Repeal cause generally, was not used in the Roman Catholic chapels of Dublin on Sunday, nor was the day observed as one of Catholic humiliation. Dr. Murray, the Roman Catholic archbishop, is said to have disapproved of the measure.—The usual weekly meeting of the Repeal Association was held on Monday in Conciliation Hall. The chair was taken by the Rev. T. Tierney, P.P., Clontibret, one of the traversers in the late state trials. The Chairman addressed the meeting, and expressed his determination to persevere till the object for which they were struggling should be achieved. Mr. Smith O'Brien commenced the business of the day by handing in several remittances. Mr. J. Kelly, M.P. for Limerick addressed the meeting. He said that on that day fortnight he had the honour of presiding over a meeting of the Association, and since then he had visited his constituents, and found that their confidence in this Association was as unbounded as ever, whilst their confidence in the foreign legislature was becoming "small by degrees and beautifully less." He would ask, what had they to expect from the British Legislature? He would therefore call on those Liberal members who had not as yet identified themselves with the movement, to shake off their listlessness and join the ranks of the Repealers, and he could assure them they would be received with open arms. It had been generally circulated that the policy of their present chief governor would be to institute a prosecution against the leaders of the Association. It was in consequence of this rumour that he was there, but he could not believe that a man of such diplomatic experience as Lord Heytesbury would resort to any such course. Should he, however, do so, and succeed in imprisoning the men he saw around him, he would find that there would be no

scarcity of others to take their places. Mr. O'Brien next rose to inform the meeting that Lord Wicklow's letter relative to the non-attendance of Irish Members in their places in Parliament had been taken into consideration by the permanent committee, and they had adopted an answer, which had been drawn up for them by Mr. Davis, one of their members. The rule of not attending Parliament was not a compulsory one; they did not insist upon any gentleman absenting himself from either House, if he thought he could do more good for Ireland there than in Conciliation Hall. But that was not his opinion, with regard at least to himself. He despaired of accomplishing anything useful for his country in the British House of Commons, and he therefore renounced it altogether. Having formed this opinion, he had intended to resign his seat for the county Limerick; but having sounded his constituents on the subject, he found they were averse to it. They were satisfied still to retain him as their representative, and therefore he intended to retain his seat. He concluded by reading the reply to Lord Wicklow, which denied the soundness of his Lordship's advice, and the validity of the reasons by which he supported it. After a long speech from Mr. Grattan, M.P., Mr. D. O'Connell, Jun., made his usual weekly return from the prison, and announced that his father and fellow-martyrs were in the very best health and spirits. He then read the opinions of his father on different topics, and a "Notice" from the Marquess of Londonderry to the pitmen and colliers on his Lordship's property, dated July 3. The meeting, he said, would recollect that on the last day of meeting the Rev. Mr. Hearne alluded to the matter. His Lordship had been pleased to designate the Irish as "foreigners," and he would call on the meeting to remember that. The rent for the week was 1000*l.*

Belfast.—The Robert Napier steamer, trading between Londonderry and Liverpool, was destroyed by fire last week while on her voyage, off Ballycastle. The captain succeeded in running her on shore, and the passengers were saved, but all their baggage was consumed.

Limerick.—On Monday morning Judge Kemmis proceeded to pass sentence on the convicted prisoners of the past week. James Regan, Mary Burns, and Thomas Looney, convicted of the Adare conspiracy and arson, were put forward, and asked if they had anything to say before sentence was pronounced. James Regan said there were never so many witnesses seen on the table before as appeared against him, though it was not for conscience sake they came forward, but to hang or transport him if they could, when he was in a hobble. If he was in the country as formerly, the very persons that swore against him would, if he committed Whiteboy offences, call him a "brave fellow, and a lover of his country." He should inform his Lordship that he was formerly a member of a Whiteboy society, which was carried on by secret signs and pass-words; while connected with it, it was planned to assassinate Lord Dunraven, which would have been carried into effect were it not for his informing the priest about it. The Judge said the prisoners were convicted on testimony as satisfactory as if the persons who swore against them saw them commit the crime. They had for some time experienced the bounty of Government, having been supported as Crown witnesses. Finding their pursuits fail, they engaged in a conspiracy of the blackest dye, in order to advance their own interest, and that with a view of swearing against innocent men, whose families and friends would, perhaps, for ever have cause to bewail their loss. He never heard the like of it. His Lordship, in conclusion, said he would draw no distinction between the prisoners in measuring punishment, and the sentence of the court was, that they be severally transported for life.

Mayo.—Martin Toolis and ten other natives of the island of Achill, were called to the bar and arraigned for administering an unlawful oath to Francis M'Hugh, on the 6th of December last. The case was tried at the last assizes, when the jury were discharged, without a verdict being had, one juror having held out against eleven, who were for acquittal. The traversers were then discharged upon their own recognizances, to appear again for trial if called upon, ten days' notice from the Crown to be given them in case they should be again required to attend. From the nature of the evidence given upon the former trial, it was generally supposed that the matter would be allowed to drop, but to the astonishment of the poor peasants who were the subjects of prosecution, they were almost at the last moment served with notice to appear for trial at the present assizes, in obedience to which they now appeared, and were put on their trial. The colony of Achill is well known to religious coteries in England, and has been supported by large collections at Exeter Hall. The prisoners were said to have conspired against the prosecutor, and the Rev. Mr. Naylor. Mr. Justice Jackson, in charging the jury, described the prosecutor's story as very improbable, and the jury without leaving the box returned a verdict of "Not Guilty," which the Judge said was a very proper verdict.

Kerry.—On Sunday the Rev. Mr. Brasbie read his recantation from Popery in Dingle Church. The fact of a priest abjuring Popery caused great excitement, and the magistrates having got full notice that the mob were determined to execute Lynch law on the priest, on his road to the church, they took full precautions to preserve the peace. A large body of Marines and Coast Guards were present on the occasion, and no disturbance took place.

SCOTLAND.

Glasgow.—The importers of guano into the Clyde for some weeks past have been interested by a quantity of glittering sand brought home by the crews of the different ships from the neighbourhood of Ichaboe, and supposed to be gold. The great fortunes, however, that were expected to be made have ended in making good the trite saying that "it is not all gold that glitters," the analysis having shown that not a particle of gold is contained in it.—The Forth and Clyde Canal Company are now carrying passengers from Glasgow to Edinburgh for 1*s.* in the steerage, and 1*s.* 6*d.* in the cabin.

Ayr.—Great preparations are in progress for a festival in honour of Robert Burns, to take place on the 6th August, under the presidency of Lord Eglinton. The Ayr town-council will join in the procession, and a large assemblage of visitors is expected from all parts.

Miscellaneous.

Opening of a Tumulus.—A tumulus or barrow, called East-low, and more generally by the rustics Essly-hill, in the parish of Ringham, near Bury St. Edmund's, was excavated and explored on the 4th ult. under the direction of the Rev. Professor Henslow. The hillock at its base is about 90 or 100 feet in diameter, and its height 13 or 14 feet, covered on all sides with thorn-bushes, except its summit, which has the appearance of a spacious harbour, accessible by several winding paths through the dense thorn bushes. The tumulus is situate at the south-eastern angle of the four crossways of a road, having to the southward three other tumuli of smaller dimensions, which had been opened at a former period. The excavation was entered on the south side, the entrance being protected by two upright pieces of timber supporting a cross beam, to prevent the earth from falling; the same precaution was taken within the subterraneous passage, as the work of excavation proceeded. At several yards distance from the entrance was found the tomb or chamber, built of flint and mortar, with rows of tiles at intervals, about 12 feet long, and 4½ feet wide. Around this chamber was cut a complete passage, wider on the side entered than on the other sides; and at the north-eastern corner of the excavation was cut a passage for egress, by which means the visitors could pass round with more convenience, or make their exit. The tomb or chamber, which appeared exceedingly fresh and solid, was broken open on the west side nearest the entrance, and on the north side, and the chamber was found to contain a leaden coffin, deposited as in a brick grave at the present day. A complete arch was found a little above the coffin, formed of Roman tiles intermixed with much mortar, and then regularly covered with Roman tiles, like the roof of a house. The leaden coffin was 6 feet 9 inches long, 1 foot 5 inches broad, and 1 foot 4 inches deep. It was formed out of a sheet of lead, by turning up the sides and ends, as in making a box or tray with a card. The edges were soldered on the inside; the lid was a loose sheet, also turned in at the edges, but without soldering. When the lid was removed, there appeared a skeleton, the skull-bone and some teeth in good preservation. In the mouth, according to ancient custom, was an obolus, or piece of money, too much corroded, probably, to ascertain its date. This was intended to pay Charon, the grim ferryman of the Styx. At the head, on the north side of the grave or chamber, and adjoining it, was a smaller chamber, perhaps about 2 feet square, which had contained Lachrymatories or small glass phials, supposed by some to be intended for holding the tears of the mourners, but considered by Professor Henslow as vessels for balms and balsams. The glass was gone to dust, which appeared like so much salt lying at the bottom of the chamber. Altogether the discovery is one of much interest to antiquarians; and Professor Henslow appears disposed to consider that the skeleton is that of the last owner of the Roman villa discovered last year near the spot, and that the tomb was erected at a late period of the Roman occupation of Britain, when it had ceased to be the practice to burn the dead.

Col. Stoddart and Capt. Conolly.—By the Levant Mail we have the following letter addressed by Dr. Wolff to Capt. Grover, containing a confirmation of our worst fears with regard to the fate of Colonel Stoddart and Captain Conolly. It is with deep regret we have to announce that the death of both these gallant officers is at length put beyond a doubt. They were executed at Bokhara in the month of June, 1842. The following is the letter:—"To Captain Grover. I write this letter in the house of Nayeb Samet Khan, the chief of the artillery and the arsenal of his Majesty the King of Bokhara, a sincere and excellent friend of the British nation—but in the presence also of his Majesty the Ameer's Mahram (private Chamberlain)—and I write this letter officially, by order of the King of Bokhara, to whom I give a translation of the letter, and therefore confine myself only to the most necessary topics, without comment and without observation. On the 29th of April the King stated to me, by the medium of the above-named Nayeb, and in the presence of Mullah Kasem, the King's Mahram (private Chamberlain), that he had put to death in the month of Sarratan, 1259 (July 1842), Colonel Stoddart and Captain Conolly. The first had been put to death:—1st, On account of his having treated royalty with the greatest disrespect on different occasions. 2d, That he had turned Mussulman and then returned to the Christian faith. 3d, That he had promised to get letters from England in four months, by which he would be acknowledged Ambassador from England, and 14 months had elapsed without receiving any answer, though the King had erected Japar Khans (post-houses) on his account. And, with regard to Conolly, that he had been put to death for having induced the Khans of Khiva and Kokan to wage war against the King of Bokhara. His Majesty has given me permission to leave Bokhara on the 9th of May, Friday next. From Meshed I will write everything more fully. (Signed) JOSEPH WOLFF. Bokhara, May 5, 1844." Subsequent accounts state that the Bokharee Envoy, who, it was said, was to have accompanied Dr. Wolff to England, had been arrested on his road from Persia at Meshed, by the Ameer of that place, as a hostage for the Doctor's safe delivery from the hands of the Ameer of Bokhara; and the latter, on hearing of this act, had declared that the Englishman should not depart until the Bokharee Envoy had been set at liberty.

Law.

SUMMER ASSIZES, NORFOLK CIRCUIT.—IPSWICH.—*Arson.*—As the principal trials at these assizes have been those for arson, and as the circumstances which led to the crime have been the subject of very general comment, it may be useful, now that the trials are concluded, to give a concise summary of the facts:—1. *Henry Sergeant*, aged 21, a labourer of Buxhall, who can read and write imperfectly; 2nd, *Eliza Sergeant*, aged 22, his wife, who can read and write well; and 3rd, *James Rudland*, who could read and write imperfectly, aged 53, a labourer, and brother-in-law of the prosecutor, were charged with having, at Buxhall, on the 2d of April, set fire to, and burnt down a barn and stable, the property of John Barnes. The bill against the woman was ignored by the grand jury, and the two male prisoners were acquitted after a lengthened trial. The summing up of Mr. Justice Williams left no one in doubt as to his opinion of the guilt of the two men, but the jury returned a verdict of acquittal. 4. *Robert Roper*, aged 15, could neither read nor write, a labourer of Gislingham, was charged with having, at Gislingham, on the 9th March, set fire to a stack of wheat, the property of the Rev. Thomas Collyer. The evidence was defective; but the case seemed much stronger when the lad was apprehended than when he was tried, the witnesses for and against him not adhering to their original statements. Mr. Baron Alderson, without summing up, put it to the jury to say if he need sum up at all, the case being so very weak? The jury seemed determined to convict, and the Judge had the greatest difficulty in proving to them that there was no evidence against the prisoner; that where there was a doubt, it was the duty of a jury to give an accused person the benefit of that doubt, but in this case, he said, there was not even a doubt. After giving the Judge much trouble, the jury returned a verdict of not guilty, and the prisoner, with tears in his eyes, asked the Judge, "whether he thought he did it?" Baron Alderson said, "No, I do not think you did it." 5. *James Smith*, a farm-servant, aged 16, could neither read nor write, was charged for having, on the 1st April, set fire to an outhouse, which, together with a dwelling-house and other outhouses, and seven cows and other animals, were consumed, the property of Samuel Easthall, of Mendlesham. There was a confession of the crime proved by a person to whom Smith confessed; not, indeed, a faultless witness, for the Judge remarked disparagingly on his evidence. Still, without his evidence, there was quite as much to convict as in some other cases. A verdict of not guilty was, however, returned. 6. *James Friend*, a labourer, aged 27, could read and write imperfectly, was charged with having, on the 8th May, sent a letter to William Cockrell, farmer, of Tunstall, threatening to set his premises on fire. The letter showed the cause of offence to have been the employment of threshing machines. Found guilty. Sentence, transportation for 15 years. 7. *William Cattermole*, bricklayer's labourer, could read and write imperfectly, charged with having sent a letter to James Rose, threatening to burn and destroy certain buildings and premises. This case was an exception to the others, having been produced by the prisoner's jealousy of a young man in Mr. Rose's employ, who was paying court to a young girl more successfully than himself. Those who heard the evidence had little doubt upon the question of guilty or not guilty; but the jury delivered a verdict of not guilty. 8. *Frederick Borley*, aged 18, a labourer, who could read and write imperfectly, charged with having, on the 19th May, set fire to and burned down one bean-stack, part of a clover-stack, and part of a hay-stack, the property of Ambrose Canler, of Stowmarket. Verdict, guilty. Transported for life. 9. *Jonathan Durrant*, a labourer, aged 17, could neither read nor write, charged with the same offence as Borley. Acquitted; there being no evidence against him, but that of an accomplice of Borley, named Williams, who stands confessed to having been an accessory before the fact. 10. *Samuel Jacob*, a shepherd, aged 28, could neither read nor write, committed for having set fire to and burned down a barn and other premises at Columbine Hall, parish of Stowupland, the property of Lord Ashburnham, in the occupation of John Boby. In this case also Williams was examined as a witness, having alleged that Jacob made a confession to him in prison. Jacob was convicted chiefly on this man's evidence; but the Judge spoke of Williams as a man utterly worthless as a witness. Jacob, however, was convicted on his evidence, and sentenced to transportation for life. 11. *David Jackson*, a farm servant, aged 14, could read and write imperfectly, was charged with having on the 3d June set fire to a barn, the property of Charles Crooknell, of Redlingfield. This fire did not take effect, a small portion of bean straw having been all that was burned, together with a piece of timber scorched. It might have been worse, and the prisoner, on being apprehended, said to the policeman, in confessing that he did it, that he was very glad it did not burn up. The lad had lived all his life on the farm, and was on the best terms with his master, in whose house he was boarded. He bore a good character, and bore his master no ill-will. But he had, on the Sunday before this attempt to fire the barn, been talking with some people about the number of "wonderful large fires there were," and he thought he would like to see one. He was found guilty, and sentenced to 15 years' transportation, with an intimation that he would be recommended to mercy, and sent to a place where he would be educated and taught a trade. 12. *John Woods*, a farm servant, aged 16, could neither read nor write; charged with having set fire to a quantity of growing furze on the 15th of June, at Foxhall, the property of Mark Major. Pleaded guilty; sentence—six months' imprisonment, and to be once whipped. 13. *Ann Manning*, aged 32, a married woman, could read and write imperfectly, charged with having, on the 27th June, set fire to the cottage in her own occupation. Found guilty; sentence—two years' imprisonment. 14. *James Thurlow*, a shoemaker, apparently 18 or 20, charged with setting fire to a quantity of growing furze at Playford. Acquitted. 15. Edmund Botwright, a blacksmith, aged 22, could read and write imperfectly, charged with burning the premises of Hannah Watling, a widow, and writing a threatening letter to her son. This man, though called a blacksmith, was not a worker at the trade. He was one of a desperate gang of poachers, who seldom worked at all. Found guilty. Sentence—transportation for life. 16. *John Spilling*, alias *Osborne*, a labourer, aged 22, could neither read nor write, charged as an accessory to Botwright. Acquitted. 17. *David Clow*, a labourer, aged 40, could neither read nor write, charged with having set fire to certain premises at Farnham, the property of Henry Heffer, machine maker. Acquitted on the ground of the fire being an accident, arising from prisoner's drunkenness. 18. *Robert Gower Grimwade*, aged 39, could read and write well, a linendraper, charged with having sent a letter to Sir J. R. Rowley, threatening to burn certain property in the occupation of William Brown, a tenant of Sir J. Rowley, if Mr. Brown did not give his labourers an increase of wages. Found guilty. Sentence, 10 years' transportation. 19. *William Hales*, labourer, aged 20, could neither read nor write, charged with setting fire to a barn at Dalham, in the occupation of Thomas Moore, the property of the Rev. Sir R.

Affleck. No true bill. 20. *Joseph Barrett*, aged 31, a labourer of Great Thurlow, education not stated, charged with setting fire to a barn and other premises on the 7th May, the property of Rebecca Jonas, Maria King, and Samuel Jonas. This was a very long trial. The prisoner had frequently quarrelled with the prosecutors, and had once said that he would make the house "too hot to hold them." The judge said, this was an expression that many persons used who did not intend to commit arson. Ultimately there was a verdict of not guilty, upon which the judge remarked, "A most righteous verdict, gentlemen." 21. *George Garrett*, an illegitimate boy aged 11, who could neither read nor write, and in the deepest poverty, charged with having set on fire a straw shed, in the occupation of James Cooper, of Naighton, found guilty, with a recommendation to mercy. The judge sentenced him to 15 years' transportation, but said he would add his own earnest recommendation for mercy to that of the jury; and he had no doubt something would be done for the future welfare of a child hitherto so friendless and neglected. 22. *Layzell Rundall*, labourer, aged 16, who could read, but not write, charged with aiding and assisting in setting fire to certain buildings and hay and straw stacks in Assington, in the occupation of Mr. Norden. Found guilty. Sentence, 15 years' transportation. 23. *Isaac Everett*, labourer, aged 21, could neither read nor write, charged with setting on fire the premises aforesaid. Found guilty. Sentence, 20 years' transportation. These two prisoners confessed their guilt, which is the reason of their lighter sentences. 24. *William Greengrass*, labourer, aged 27, could read and write imperfecly, charged with sending a letter to Mr. Isaac Fiske, of Treston, threatening to shoot him, or do him some grievous bodily harm. Pleaded guilty. Sentence, two years' imprisonment and hard labour. 25. *Robert Hammond*, a carpenter, aged 35, could read and write well, charged with having, on the 2d June, set fire to a stable, cow-house, and other erections, the property of Wooton Isaacson, Esq., of Mildenhall. Found guilty. Sentence, 20 years' transportation. 26. *Martin Turner*, a labourer, aged 33, can neither read nor write, charged with having, on the 27th April, set fire to a certain barn, &c., in the occupation of Robert Gitturs, the property of Sir H. G. Bunbury. Found guilty. Sentence, transportation for life. 27. *George Davey*, aged 13, could neither read nor write; charged with having set fire to a quantity of underwood, at Stanton, the property of William Taylor. Found guilty. Sentence, three months' imprisonment, and to be twice whipped. 28. *Robert Leakes*, aged 11; committed by the same magistrates for the same offence. No true bill. 29. *James Micklefield*, labourer, aged 17; can neither read nor write; charged with having set fire to a farmstead in the occupation of George Mumford, in Little Cornord, and destroyed certain barns, stacks of wheat, beans, and straw, a great number of sheep, calves, and pigs, and other property, belonging to the said George Mumford. Found guilty. Sentence, transportation for life. 30. *James Lankester*, a labourer, aged 30, could read, but not write; charged with setting on fire a stack of wheat, the property of Frederick Payne, of Great Barton. Found guilty. Sentence, transportation for life. In passing sentence on this man, Baron Alderson remarked on the peculiar enormity of his offence, in having gone about the country expressing and spreading the most pernicious opinions against the use of machinery and against corn-stacks. 31. *Philip Goodman*, aged 12, could read, but not write; 32. *Paul Goodman*, aged 11, could read, but not write; 33. *Alfred Frances*, aged 12, could read and write; these three were charged with setting fire to a straw and haulm stack, the property of William Allen, of Hepworth. No true bill. Thus, of the incendiaries who have lighted up one hundred or more fires in Suffolk during the present summer, or who have threatened the owners of farm property, 33 have been in prison. Of these, 5 were discharged by the grand jury, 27 were brought to trial, and 1 was admitted a witness. Of those tried, 10 were acquitted, and 17 were convicted. Of those convicted, 6 are transported for life; 2 for twenty years; 4 for fifteen years; 1 for ten years; 2 are sentenced to two years' imprisonment; 1 to six months' imprisonment and a whipping; and 1 to three months' imprisonment and two whippings.

SPORTING.

GOODWOOD RACES, TUESDAY.—*Craven Stakes* of 10 sovs each. One mile and a quarter. Mr. Boyce's Corranna, 5 yrs, beat Lord Chesterfield's Knight of the Whistle, 6 yrs, Duke of Richmond's Lothario, 4 yrs, Mr. Forth's c. by Velocipede, 3 yrs, Mr. Dixon's Jamal, 4 yrs, and Lord G. SHEPPARD, of Staplegrove, aged 62—28th ult., at his house, in Melbury-terrace, W. PLUNKETT, Esq., barrister-at-law, eldest son of the late W. Plunkett, Esq., Deputy Chairman of the Board of Excise, aged 37—28th ult., at his residence, 42, Tavistock-street, Covent Garden, Mr. J. O. PETTIT, late of her Majesty's Customs, London, aged 74—29th ult., of scarlet fever, AGNES PRITT, second daughter of G. Pritt, Esq., of Bentinck-terrace, Regent's Park, and Parliament-street, Westminster—30th ult., at his house, in Crosby-square, THOMAS R. ALSTON, aged 56.

POTTS'S PATENT for HANGING PICTURES.—"Artis est celare artem." The advantages of this system are, it has strength to suspend the heaviest Pictures; it is fixed up closely under the cornice, forming the bottom member of it, and saving the expence of a gilt moulding, which it resembles; thus combining an elegant Architectural ornament to the room, and the means to hang Pictures. Specimens at Mr. NOTTINGHAM'S, 33, Argyll-st., Regent-st.; and 6, St. Bene't place, Gracechurch-street.

REFINED PLEASURE to LOVERS of BOTANY.—The Nobility and Gentry are respectfully informed that the splendid WARDIAN PLANT CASES, which excited so much attention and obtained a Medal at the late Chiswick Fête are now on view at No. 33, Argyll-street, Regent-street.

The suggestions of PROFESSOR LINDLEY have been earnestly carried out by the manufacturer, Mr. POTTS, so as to elicit the entire approval of that eminent authority. The varied charms of Nature are aided by the gorgeous enrichments of Art; and the Invalid, however exalted her station, may now enjoy, at all seasons, the beauties of Flora, in a cabinet not unworthy a place in the most aristocratic mansions.—Agent, Mr. NOTTINGHAM.

WANTED, as BAILIFF. — A middle-aged Man, (married or single) at Michaelmas next, to look after a Grazing Farm; he must be a good accountant, have filled a similar situation, and have an excellent character.—Direct to A.B., at No. 189, Regent-street, London.

WANTED, a MAN and his WIFE, by a Family residing a few miles from town—the Man as GARDENER and GROOM, the Woman as LAUNDRESS. They will live out of the House, in a Cottage provided for them.—Direct to A. B., Post-office, Stanmore.

WANTED, as PROPAGATOR in the under-mentioned Nursery, a young Man who perfectly understands his business.—Direct to E. G. HENDERSON, Wellington Nursery, Wellington-road, St. John's Wood, London.

WANTED IMMEDIATELY, a steady, active man, as PROPAGATOR. None need apply who does not thoroughly understand the Propagation of Heaths. Direct to J. RIGBY, Stanhope Nursery, Old Brompton.

WANTED, a MAN and his WIFE.—The Man as GARDENER, with care of a Cow, and Horse and Chaise. The Woman, as Servant of all Work, and to attend to Poultry, Dairy, &c., for wages and board, 20*s*. per week, with lodgings, coals and candles. Apply at 103, Great Russell-st., Bloomsbury.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—A married Man without incumbrance, who has a thorough knowledge of his Profession in all its branches, with forcing, cultivation of land, &c. Can have a good character from the gentleman he has just left.—Direct to J. A., 9, Spring Gardens, Clapham Common, Surrey.

AS GARDENER.—A Single, Middle-aged Man, who thoroughly understands his business, the management of Pines, Grapes, and Forcing in general. Likewise Kitchen and Flower-Garden, &c. Can have an unexceptionable character from his last situation, in which he has been living with a respectable family in Cornwall.—Direct to A.B., at Mr. Weaver's, Porter Merchant, New-street, Penzance, Cornwall.

AS GARDENER.—A respectable married Man, without incumbrance, who has lived in his last situation 24 years, and can produce testimonials of good character and ability. Not so particular as to wages as a comfortable situation.—Direct to Mr. FIELDER, 42, Cavendish-street, Chichester, Sussex.

AS GARDENER.—Mr. REDDING, Gardener to Mrs. Marryatt, Wimbledon House, Surrey, can with all confidence recommend a Man to any Nobleman or Gentleman in want of a competent and trustworthy servant in the above capacity. He is married, and 26 years of age. Has served 2½ years in the above establishment. Wages, 25*s*. per week.

AS GARDENER.—A married Man without incumbrance, of sober habits, who perfectly understands his profession in all its branches; his wife is a good plain cook, and could take care of the house when the family is from home, or would accept a weekly situation; they have both lived in the above capacities, and would have no objection to any part of the country; can have good characters from their last situation. Direct to A.B., Mr. Trinder's, Forest-hill, Peckham Rye, Surrey.

AS GARDENER.—JOHN ROBERTSON, Gardener to Mrs. Lawrence, Ealing Park, Ealing, Middlesex, will have great pleasure in recommending a young Man as Gardener to any nobleman or gentleman in want of a competent and trustworthy servant. He has likewise lived as foreman in two noblemens' gardens, by whose gardeners he can also be recommended.—Direct as above.

AS GARDENER.—A married Man, 40 years of age, who thoroughly understands his business, and can have a five years' Character from his late Employer.—Direct to J. C., 4, Aston Buildings, Holloway-road, Islington.

AS GARDENER.—A Married Man, aged 37, without incumbrance, who thoroughly understands his business, with Land and Stock, if required; can have 4½ years' character and be strongly recommended from the Gentleman he has just left.—Direct to P. Q., Mrs. Thompson, Marlboro'-road, Chelsea.

AS UNDER-GARDENER AND FLORIST.—A respectable young Man would give any gentleman's gardener or florist 10*l*. for 3 years' employment, to be further instructed in the above line.—Direct to W. E. H., Post-office, Stratford, Essex.

AS GAME-KEEPER.—A highly-respectable and experienced person, 33 years of age, who perfectly understands the business, and is likewise a good shot. — Direct to A. B. C., Post-office, Bodmin, Cornwall.

AS GROOM AND GARDENER, OR COACHMAN AND GROOM.—A Married Man, aged 27, has no incumbrance, can have a good character from the situation he has just left.—Direct to Mr. SALTER, Spooner's Cottages, New Park-road, Brixton-hill, Surrey.

NURSERY OF L. VAN HOUTTE, at GHENT, BELGIUM.

GLADIOLUS GANDAVENSIS, V.H. (Glad. gandiensis, *Paxt.*)—Fine Bulbs at 10*s*. 6*d*. With the usual discount to the trade. N. B. All letters to Belgium must be paid.

CAMELLIA.—A Seedling Camellia, raised by a gentleman in the neighbourhood of Manchester, and named "Duke of Lancaster," a drawing of which may be seen at Mr. G. Charlwood's, 14, Tavistock-row, Covent Garden, London, from whom further information may be obtained; also at R. S. Yates's, St. Ann's-square, Manchester.

PINE PLANTS.—Persons in want of the above have an opportunity of choosing from a particularly strong and healthy stock, warranted clean, at moderate prices. Apply personally or per post to W. Davis, Green-street, Marlboro'-road, Chelsea.

QUEEN VICTORIA FUCHSIA.

JOHN SMITH begs respectfully to inform his friends who have kindly favoured him with their orders for the above splendid FUCHSIA, that his stock only consists of a few Plants, and is therefore obliged to defer sending it out this year.

Dalston Nursery, August 8, 1844.

T. AND J. BACKHOUSE, Nursery & Seedsmen, York, beg to offer to the public strong plants of the following new and rare species:—Achimenes picta, 10*s*. 6*d*.; Aristolochia gigas, 10*s*. 6*d*.; Lisianthus nigrescens, (small) 2*s*. 6*d*.

T. and J. B. have also a good stock of Lisianthus Russellianus, Phlox picta, Van Houttii and bicolor, 1*s*. 6*d*. each; Achimenes hirsuta, 2*s*. 6*d*.; and Pentstemon Murrayana, 2*s*. 6*d*.

J. AND J. FAIRBAIRN, beg most respectfully to acquaint their friends and the public, that they have now many very interesting specimens of HEATHS in flower, which they feel assured will be found worthy of inspection. Open every day, (Sundays excepted) admission gratis.—Nurseries, Clapham, near London, Aug. 8, 1844.

INGA PULCHERRIMA. (Figured in "Paxton's Magazine of Botany" for August, 1844.)—Fine Plants of this extremely elegant and beautiful Exotic, with most of the other new and rare Plants of the season, may be obtained of the undersigned, at the following low prices:—

Inga pulcherrima, 7*s*. 6*d*.
Achimenes picta, 10*s*. 6*d*.
Æschynanthus Horsfieldii, 7*s*. 6*d*.
Amycia zygomeris, 7*s*. 6*d*.
Clerodendron splendens, 10*s*. 6*d*
" squamatum, 5*s*.
Hindsia, or Rondeletia longiflora, 15*s*.
Epacris campanulata rosea (the finest selected from 1000 seedlings), 7*s*. 0*d*.
Habrothamnus elegans, 15*s*.
Tremandra Hugelii, 10*s*. 6*d*. to 21*s*.
Veronica speciosa, 5*s*. to 15*s*.
Erica elegans, fine and healthy, 15*s*., 24*s*., and 30*s*. per doz.

Thomas Jackson, Kingston Nursery, Surrey, August 8.

THE WALCHEREN CAULIFLOWER.

MESSRS. MARNOCK AND MANLEY beg to inform their friends and the public that they have a few packets of the above genuine article left, which should be sown for a general crop to stand the winter from the 12th to the 20th of August. Owing to the excessively dry season, the spring sowing has not turned out so favourable as it otherwise would have done; but they will warrant it to answer every description given of it in their treatise; Price, 4*s*. per ounce.

Nursery, Hackney, Aug. 8, 1844.

THE BEST TWENTY-FOUR VERBENAS EVER OFFERED, for 21*s*., or TWELVE for 12*s*.

GEORGE SMITH begs to offer the following splendid Verbenas, which comprise the choicest varieties of the season. They were shown at the Royal Botanic Gardens of London, and were much admired for their fine form and distinct colours: they obtained the First Prize. Smith's Array, Delicata, Excelsa, Striata; Parson's Beauty Supreme, Atro-sanguinea, Coccinea, Princess Alice; Stewart's Azurea grandiflora, Queen of the Whites; Youell's Brilliant Elegant, Monarch, Surprise, Princess Royal; White's Wonder, Variabilis, Perfection, Modesty, Scarperii, Surprise; Fuller's Incomparable, Jessie, Louis-Philippe; Miller's Blue Queen, Zeuxis; Girling's Boule de Feu, Beauty, Renown, Orange Perfection, Atro-purpurea, Howardii, Pomii, Ignescens, Van Gentii, Ne plus Ultra, Stewartii, Hislopeana, Variegatus, Queen of Verbenas.

Tollington Nursery, Hornsey-road, Islington, near London.

WANTED.—The overplus Stock of Cuttings and Plants of GERANIUMS, &c. of an Amateur, in exchange for Greenhouse Plants.—Direct A. F. T., 21, Canterbury Place, Walworth.

YOUELL AND CO.,

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

YOUELL AND CO. are now sending to any part of the United Kingdom the undermentioned highly-desirable Plants, full particulars of which will be found in their former Advertisements.

FUCHSIAS—per post free.

12 Extra Fine varieties, 12*s*., the Selection left to Youell & Co.
12 ditto ditto 21*s*., the Selection left to the Purchaser, *comprising most of the new varieties sent out this season.*
50 Fine varieties . . 40*s*., the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s*., the Selection left to the Purchaser.

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers is now in full bloom, and will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and will be ready for sending out to any part of the United Kingdom and the Continent the latter part of next month, at the following prices:—

			£	*s*.	*d*.
12 pairs extra fine and very superior first-class Show Flowers			2	10	0
25	ditto	ditto ditto	5	0	0
12	ditto	ditto Show Flowers	1	10	0
25	ditto	ditto ditto	3	0	0

VERBENAS—per post free.

12 Extra fine Varieties, 6*s*., the selection left to Youell & Co.
12 Ditto ,, 10*s*., the selection left to the purchaser.

PANSIES. [Sent postage free.]

12 Fine Show Varieties, by name . . 10*s*. per dozen
12 Extra Fine ditto, do. . . 18*s*. ,,

CHRYSANTHEMUMS. (Sent postage free.)

Fifty of the newest best varieties by name, 12*s*. per dozen, for names and colours of which, see Advertisement of June 15th.

PETUNIAS—per post free.

Extra Fine Varieties, 12*s*. per doz., including Miller's Punctata.
PANSY "Lady Alice Peel" (for particulars of which see Advertisement of June 1, 1844), 3*s*. 6*d*. per plant.
ARAUCARIA IMBRICATA, in pots, 5 years old, 30*s*. per dozen, or 10*l*. per 100.
CEDRUS DEODARA, 2 ft. to 2 ft. 8 in., 10*s*. 6*d*. per plant.

Also, the following highly-desirable Plants:—

Buddlea Lindleyana (the new Blue Buddlea, from China), 7*s*. 6*d*. per plant
Achimenes picta, 7*s*. 6*d*.
,, hirsuta, 2*s*. 6*d*.
Marcettia rosmarinifolia, 2*s*. 6*d*.
Thunbergia chrysops, 10*s*. 6*d*.
Habrothamnus fasciculatus, 3*s*. 6*d*.
Bouvardia strigosa, 5*s*.
Veronica speciosa, 2*s*. 6*d*.
Pinus Gerardiana, 60*s*. p. doz.
,, Excelsa, 30*s*. per dozen.

N.B. All Orders above £2 are delivered carriage free to London or Hull, or plants added to compensate for the same.

Great Yarmouth Nursery, August 8, 1844.

KINGHORN'S NEW SPLENDID CALCEOLARIAS of 1844.

WILLIAM MAY, F.H.S., having been the fortunate purchaser of the entire stock of Five of the best sorts of Calceolarias raised by Mr. Kinghorn this season, and exhibited by him in May last (vide *Chronicle* and *Gazette* of May 25th,—the Editors of which pronounced them as very superior to "Lady Constable" and all others in present cultivation). The Five will be sent out in sets, of which due notice will be given. Parties wishing to possess these splendid varieties to address him at Hope Nursery, Bedale, Yorkshire.

W. M. has at present a fine stock of that beautiful new Exotic DRYMONIA PUNCTATA, which will be sent free on receipt of a Post-office order for 6*s*.; as also SEEDS of his very select varieties of PANSIES, CALCEOLARIAS, and HOLLYHOCK, in packets at 2*s*. 6*d*. and 5*s*. each, post free.

The Seeds may also be had of Mr. Watkinson, Horticultural Agent, &c., Market-place, Manchester, of whom may be ordered the Calceolarias, &c.

N.B.—W. M.'s newly published general Catalogue of Plants, with descriptions of his Calceolarias, Fuchsias, Geraniums, Pansies, Roses, Cinerarias, Camellias, &c. &c. may be had on application.

RARE AND BEAUTIFUL COLUMBINE.—The Subscribers beg to intimate that they have saved Seeds of a superb variety of Aquilegia glandulosa. This splendid Columbine is a hardy Perennial, and forms one of the most gay border-plants in cultivation; it grows to the height of from 12 to 18 inches, abounding in two coloured blossoms—blue and white—of the size and shape of the common Passion-flower. Packages of about 150 Seeds are sent free at One Shilling per packet, or for stamps of that value.

John Grigor and Co., Nurseries, Forres, N.B.

NEW SEEDLING PANSY.

JOSEPH FRYER begs to offer to the notice of the Public a very superior Seedling Pansy, named Standard, of which the following opinion has been given:—"Your seedling Pansy is a decidedly good flower; the form as near perfection as anything we have seen: substance unobjectionable, good size just covers a crown piece), and the colour rich and full; upper petals deep violet purple, with a band of the same colour round the lower ones, which are bright yellow; the eye of brownish crimson, full and distinct."—See "Florist's Journal" for July. Good Plants are now ready for sending out, postage free, at 5*s*. each, with trade allowance if 3 are taken.

J. F. likewise begs to remind his friends that he can now supply healthy young plants of most of the leading varieties of Pansies, from 6*s*. to 18*s*. per dozen, postage free. A remittance required from unknown correspondents.

Clarendon Nursery, Camberwell, London, Aug. 9.

MESSRS. J. AND H. BROWN are now sending out to any part of the Kingdom the following very desirable Plants:—

Chrysanthemums, newest and best varieties, by name, 9*s*. per dozen
Fuchsias, all the leading varieties, 6*s*. to 9*s*. per dozen
Angeloma grandiflora, 9*s*. per dozen
Scutellaria splendens, 9*s*. per dozen
Bouvardias, four varieties, 6*s*. per dozen
50 Hardy Herbaceous Plants, 25*s*.
100 ditto ditto 45*s*.
12 varieties of Tea-scented Roses, 9*s*. per dozen
Yellow Noisette and Yellow and White China do., 9*s*. p. doz.
Fine New Buff Rose, Eliza Sauvage, 18*s*. per dozen
New Crimson Odorata Rose, 12*s*. per dozen
Alba and Rosa odorata do., 9*s*. per dozen
Fine Blooming Plants of Achimenes grandiflora, longiflora, pedunculata, and rosea, 6*s*. per doz.; hirsuta, 1*s*. 6*d*. each
The new Achimenes picta, 7*s*. 6*d*. each
Gesnera tubiflora, fine new white, 2*s*. 6*d*. each
Pentas carnea, 3*s*. 6*d*.; Thunbergia chrysops, 7*s*. 6*d*.; Inga pulcherrima, 5*s*.; Veronica speciosa, 3*s*. 6*d*.; Brugmansia floribunda, 3*s*. 6*d*. each
Fine Cineraria, Primula, Calceolaria, and choice Geranium Seed, 1*s*. per paper; and other Flower-seed, 3*d*. and 6*d*., can be sent by post, for stamps.

Albion Nursery, Stoke Newington, London.

EXHIBITION OF LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Amateurs, that his extensive assortment of this most beautiful Lily, which has been so much admired, is in flower, and will continue in perfection about three weeks, and may be viewed every day, Sundays excepted. Admittance Gratis.

Clapham Rise, August 10, 1844.

DUTCH FLOWER BULBS.

J. CARTER, Seedsman and Florist, 238, High Holborn, London, respectfully informs the Nobility, Gentry, and his Customers in general, that his Annual Catalogue of Genuine Dutch Bulbs, &c. will be published as usual on the 1st of September, and that it will immediately be forwarden to his Customers. In case of accidental omission, he begs to be reminded thereof.

The annexed Advertisement contains a List of such Seeds as are proper for sowing during this and half the following month, with this exception, that Double Hollyhock, Queen, and Brompton Stock should be sown immediately.

FLORICULTURAL SEEDS.

J. CARTER, Seedsman and Florist, No. 238, High Holborn, London, begs leave to recommend the following Seeds for present and autumn sowing. The Annuals he has selected will flower in the autumn if sown this month. He would recommend a second sowing early in September; for those sown in the autumn will flower earlier, and much finer than the spring sown, particularly in dry seasons like the present.

1.—Hardy Annuals in Assortments.

8 fine Calliopsis	2*s*.	0*d*.	8 fine Schizanthus	2*s*.	0*d*.
8 — Clarkia	1	6	20 — *German Stocks.	5	0
12 — dwarf Larkspur	2	6	8 — *Tenweek	2	0
8 — tall Larkspur	1	6			
7 — Nemophila	2	0	40 — hardy Annuals	8	0
8 — Godetia	1	6	20 — ditto	4	0
6 — Gilia	1	0	10 — ditto	2	0

* All Stocks require protection in winter, the others not.

2.—Hardy Biennials and Perennials.

8 fine Campanula	2*s*.	0*d*.	40 fine Perennials	10	0
8 — Dianthus	2	0	20 — ditto	5	0
8 — Pentstemon	2	0	10 — ditto	2	6
8 — new Scabious	2	6	Antirrhinum, 10 fine var. mixed	2	6
6 — Antirrhinum	1	0			
6 — Aquilegia	1	6	Delphinium, 8 ditto	0	6
20 — Hollyhock	4	0	Hollyhock, 16 fine var. mixed	1	0
12 — *Queen Stocks	3	6	Scabiosa, splendid new mixed	0	6
6 — ditto	2	0			
5 — *Brompton	2	0			

3.—Greenhouse Seeds.

10 fine Sorts	4*s*.	0*d*.	Chinese Primrose, mix.	1*s*.	6*d*.
8 — Climbers	4	0	Per packet.		
8 — Alstroemeria	4	0	Finest mixed Cineraria	1	6
4 — Thunbergia	2	0	— Calceolaria	1	6
3 — Portulaca	1	6	— Gloxinia	1	6
Phlox Drummondii, scarlet	1	0	— Erica	2	6
Ditto, 20 var. mixed	1	0	— Gladiolus	1	6
3 fine Tropæolum	2	0	— Verbena	1	6

And most other Flower Seeds contained in his General Catalogue for 1844.

*** A comprehensive Catalogue of Dutch Bulbs will be published at the usual time.

EARLIEST STRAWBERRY in CULTIVATION.—Strong Plants of the PRINCESS ALICE MAUDE STRAWBERRY, which has proved itself to be the earliest grown in this country, are now ready to be sent out, at 30*s*. per 100. As an Early Strawberry it has taken the first prize at all the Horticultural Exhibitions in the early part of the season. Also Plants of the Prince of Queen, Deptford Pine, Prince Albert, and all the leading kinds. To be had of Warner and Warner, Seedsmen, 28, Cornhill, London.

SHILLING'S QUEEN CABBAGE.—This month and part of August being the time to sow Cabbage Seed for the Autumn and Spring Planting, J. & S. SHILLING having a little Seed left of the above very superior kind, which they highly recommend to those who have not already tried it, beg to offer it to the Public generally, in half oz. packets, postage free, at 2*s*. 6*d*. each, on the receipt of postage stamps or a Post-office order.—Northwarnborough Nurseries, Odiham, Hants.

*** Agent for London, Mr. Kernan, 4, Great Russell-street Covent Garden.

NEW AND RARE PLANTS.

W. J. EPPS begs respectfully to offer the following new and valuable Plants:—

Achimenes picta, 10s. 6d.
A. hirsuta, strong plants, 2s. 6d.
Buddlea Lindleyana, 10s. 6d.
Thunbergia chrysops
Drymonia punctata, 10s. 6d. (for description see Paxton's Magazine for June)
Habrothamnus fascicularis, 5s.
Brugmansia parviflora, 5s.
" Knightii, 5s.
Pentas carnea, 5s.
Clerodendron lævifolium, 7s. 6d.
Gloxinia Cartonii, 10s. 6d.
" bicolor, 7s. 6d.
" magniflora, 7s. 6d.
" insignis, 7s. 6d. (these are the finest varieties known)
Begonia coccinea, 2s. 6d.
Rose, Cloth of Gold, 7s. 6d.
Fuchsia, Kentish Bride, blue corolla, pink tube and sepals, decidedly the finest variety sent out this year, strong plants, 3s. 6d.

Orders to be accompanied with a remittance or a respectable reference.—Bower Nursery, Maidstone. Aug, 8, 1844.

THE HAMPSHIRE BROWN COS LETTUCE.—Persons desirous of possessing a very superior LETTUCE during the winter and spring will not be disappointed if they sow the above kind any time this month. Sold by J. and S. Shilling, in ½ oz packets, at 2s. 6d. each.

SHILLING'S QUEEN CABBAGE, which is highly recommended for garden purposes, should be sown immediately, for the autumn and spring planting, ½ oz. packets at 2s. 6d. each, sent free on the receipt of postage stamps or a Post-office order.

London Agent, Mr. Kernan, 4, Great Russell-street, Covent Garden.

P.S.—To purchasers of the Lettuce Seed the Advertisers take the liberty of recommending a few seeds being kept to sow in the spring, to prove it for the summer.

Northwarnbro' Nurseries, Odiham, Hants.

TO NOBLEMEN AND GENTLEMEN'S GARDENERS.

EARLY POTATO SEED.—M. SMITH having been very successful in raising Early Potatoes from the Seed of the Potato Plum, is happy in being able to offer Potatoes for seed of so early and fine a quality as has not been equalled. The first is his six weeks Dwarf Seedling. This is a very fine early Potato; so early that with ordinary cultivation it will be ready for use in six weeks from the time of planting. It is particularly well adapted for forcing, being so dwarfish in the stem as not to exceed from four to six inches in height. The Potato is very shallow-eyed, and of first-rate quality, but not large, the largest being about the size of a bantam's egg.—Price 20s. the imperial pound.

Second, his prize-taking Seedling. This is a very early, large, and fine Potato; shallow-eyed. It has taken the first prize at the Berwickshire Horticultural Shows during the last two years for its size, beauty, and good quality.—Price 15s. the imperial stone.

Third, his second Early Seedling. This is a Potato of first-rate quality—comes in class after the Prize-taker; is a rich bearer and shallow-eyed, making up the blank between the first Early and what is commonly termed American or Second Early.—Price 15s. the imperial stone.

Those wishing to be supplied with seed of any of the above Seedling Potatoes will address their order to Mr. Smith, Gardener, Ayton, Berwickshire, with a Post-office order for the amount of their demand. They are requested to give their address distinctly, that the Potatoes may be forwarded without delay to the proper quarter. Early application will be necessary to obtain a supply, as the stock is limited.

All orders will be punctually attended to, and the Potatoes forwarded, packed in boxes, with moss or hay, to protect them from injury by carriage. Ayton, Aug. 9, 1844. M. Smith.

BENTALL'S IMPROVED PAPER FOR DRYING PLANTS.

W. and T. BENTALL earnestly invite the attention of Botanists to the above Paper; its perfect adaptation to the purpose for which it is prepared having been fully proved. The following valuable testimonial has been lately received:—

"I highly approve of your new Paper for drying plants, and consider it far preferable to the Cambridge Chalk Paper, which I previously employed, but which will now be entirely discarded by me in the preparation of plants for the herbarium. I have also found it most valuable in drying Algæ, the most decisive test, in my opinion, to which such papers can be subjected; and can safely recommend it to all engaged in the study of these plants."—*Rev. W. S. Hore, M.A. F.L.S., &c., Stoke, Devonport.*

Sir W. J. Hooker, K.H., L.L.D., &c. Professor Lindley, C. C. Babington, Esq., M.A. F.L.S. &c., H. C. Watson, Esq., F.L.S. &c., have also kindly allowed the use of their names as strongly recommending it. To be had of the Manufacturers, Halstead, Essex; and of their Agents, Mr. E. Newman, 9, Devonshire-street, Bishopsgate, London; and Mr. R. S. McIntosh, 12, Catherine-street, Edinburgh.

Sizes, 16 by 10 inches (when folded), 14s. per ream; 20 by 12 inches, 20s. do.; 16 by 20 inches, 25s. do.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND-MACHINE, for depositing all kinds of Seed on the various Soils, with the greatest accuracy and despatch.—This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of Seed intended to be planted, into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kind of Garden Seeds. *1l.* 10s. each. Commission allowed to Agents.

These Dibbles may be obtained of Messrs. Cottam and Hallen, 2, Winsley-st., Oxford-st., London, through the agency of the principal Agricultural Implement Sellers, in the United Kingdom; or from the Inventor, by letter, to his address, inclosing a Post-office order for the amount.—Richard Smith, Upper Hall, near Droitwich, Worcestershire.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8s. Garden-Lights made and glazed from 1s. per foot, at Jas. Watts' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

CONSTRUCTION OF HOTHOUSES, &c.

THE great want of skill in the construction of Old HOTHOUSES, &c., as well as in the cultivation of that most liberal of all plants, the VINE; the loss sustained on moneys expended on horticultural erections, without studying the convenience and capabilities of such erections being made available to the double purpose of a Stove and Vinery, must be manifest to all practical men. As every Hothouse, Stove, or Greenhouse, is convertible into a Vinery 7 months in every year, it is the intention of the writer, a thoroughly practical gardener, to offer his services, and tender his advice in alterations of old or new works of this kind, on such terms as must insure his engagement by all parties about to erect or alter buildings of this description. To all Ameteurs, Gardeners, and others lacking skill, whose crop of Grapes or Vines have failed, within 7 miles of London, he offers his services, advice, and directional attendance, from 1*l.* per year; and pledges himself to insure a crop on the principle of No cure, no pay, No crop, no money. For further particulars, apply by letter, inclosing 2 penny stamps, when a prospectus, &c. will be forwarded. Direct to Mr. Protestus, Messrs. Gibbs, Seedsmen, Half-moon-street, Piccadilly, London.

LYNDON'S PATENT SPADE.—Sold by Green and Constable, Ironmongers, 36, King William-st., London-bridge. Horticultural Tool Chests, Bright Ladies' Spades, Money's Patent Water Pots, Lord Vernon's Patent Hose, with a general assortment of Garden Implements.

REFINED PLEASURE to LOVERS of BOTANY.—The Nobility and Gentry are respectfully informed that the splendid WARDIAN PLANT CASES, which excited so much attention and obtained a Medal at the late Chiswick Fête, are now on view at No. 33, Argyll-street, Regent-street.

The suggestions of Professor Lindley have been earnestly carried out by the manufacturer, Mr. Potts, so as to elicit the entire approval of that eminent authority. The varied charms of Nature are aided by the gorgeous enrichments of Art; and the Invalid, however exalted her station, may now enjoy, at all seasons, the beauties of Flora, in a cabinet not unworthy a place in the most aristocratic mansions.—Apply to Mr. Nottingham, as above.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BURBIDGE and HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

Burbidge and Healy respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, Burbidge and Healy refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. Glendinning, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.		Flue Door.		Damper.		Will heat of Pipe.	Forcing Pit, Length by feet.
in.	*l.* *s.*	*s.*	*s.*	*d.*	*s.*	*d.*	*s.*	*d.*		
10	1 5	20	7	6	6	6	2	6	30 feet.	12 to 20
Ribbed Boiler.										
10	2 2	20	10	6	7	6	2	6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12	6	7	6	3	6	80 to 125 feet.	40 to 65
14	3 10	35	17	5	8	6	4	6	150 to 250 feet.	65 to 100
18	5 5	42	25	0	8	6	5	6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35	0	8	6	7	6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON and CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. Rendle, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

CONICAL BOILERS.—The Boilers invented by John Rogers, Esq., are made of several sizes, and may be obtained of John Shewen, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple-place, Edgware-road: Robinson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick, and in the Gardens of the Royal Botanical Society, Regents'-park.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS and SONS, LONDON;
Wm. J. MYERS and CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, and PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Aug. 8, 1844.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the Ship, or water-side premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to James Clark, 24, Billiter-street.

Sales by Auction.

TO NOBLEMEN, GENTLEMEN, SEEDSMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS have received instructions from T. and C. Lockhart, of the late Firm of T. and C. Lockhart and Duncan, in consequence of a dissolution of Partnership, to submit to public competition, by auction, on the premises at Parson's green lane, Fulham, and at 156, Cheapside, London, about or before the 14th September next, the whole of the late partnership's Stock and Fixtures, of which further notice will be given.—This valuable Stock consists of a unique collection of BULBS and FLOWER-ROOTS of every description, which has been carefully selected, both at home and abroad, during the last 25 years, together with a quantity of the newest and most choice Flower Seeds, well worthy the attention of the trade; a newly-erected Hothouse with boiler and hot-water pipes, a capital brick-built pit, boxes, frames, handlights, six nests of seed-drawers, two desks, two bulb stages, hardy herbaceous and other plants, standard roses, a quantity of box edging, bushel and other measures, a Chubb's patent Iron safe, scales, weights, bags, paper, garden-utensils, cutlery, sieves, pots, sundries, &c. &c. &c.

May be viewed one week prior to the Sale, and Catalogues had.

BEDFORDSHIRE.—Very Eligible Freehold Estates in the parish of Sandy, cultivated as Garden Ground, and offering to Trustees safe and profitable Landed Investments, not to be influenced by any change in the Corn-laws. Also a Freehold Family Residence, and other property, at Caldecote. The whole Tithe-free and Land-Tax redeemed.

MESSRS. RUSHWORTH AND JARVIS are instructed by the Mortgagees, with the concurrence of the Devisees in Trust under the will, to sell by Auction, at Garraway's, London, on Friday, Aug. 23d, at 12 o'clock, in 15 Lots, (unless previously disposed of by private contract), a very desirable Freehold Property, comprising 170 acres of land, with two Farm Homesteads, situate at Beeston, in the parish of Sandy, a district proverbial for the remarkable richness and fertility of the soil, and highly valuable as garden ground; a portion of which was late in the occupation of the deceased, and the remainder is let on long leases to responsible tenants, at almost incredibly high rents; and substantial additional advantages to the property may be looked for from the newly-projected Line of Railway, direct from London to York, which is contemplated will pass over this estate. There are likewise several Cottages, a Wheelwright's shop, and Beer-house, at Beeston Green. Also a spacious Family Residence, with possession, in a fine sporting country, and having extensive stabling and out-buildings; a Licensed Ale-house, eleven Cottages near thereto, and 4 acres of luxuriant garden ground adjoining, situate at Caldecote, only one and a-half mile distant from the preceding property, and equidistant with the capital Market Town of Bedford, and only 47 miles from London on the great north road.—Printed particulars, with plans, may be obtained on the premises at Caldecote, at the principal Inns in the neighbouring towns, and in London, of Messrs. Barker, Rose, and Norton, Solicitors, 50, Mark-lane; Messrs. Gregory, Faulkner, Gregory and Bourdillon, Solicitors, 1, Bedford-row; at Garraway's; and at the Offices of Messrs. Rushworth and Jarvis, Land Surveyors and Auctioneers, Saville-row, Regent-street, and 19, Change Alley, Cornhill.

RARE ORCHIDACEÆ FROM THE EAST INDIES.

MESSRS. J. C. and S. STEVENS beg to announce they will sell by Auction at their Great Room, 38, King-street, Covent Garden, on Thursday, 15th Aug., at 1 o'clock, a case of Terrestrial and Aerial ORCHIDACEÆ, which have just arrived in fine Health, and gathered during the months of Jan. and Feb. last, on the Steeps of the Ghauts, in the Presidency of Bombay. On view 2 days prior to the sale, and Catalogues had of the Auctioneers, 38, King-street, Covent Garden.

To FLORICULTURISTS, NURSERYMEN, & CONNOISEURS.

MR. E. E. STONE will sell by Auction, on the Premises, 22, Park Place West, Liverpool Road, Islington, on Tuesday, August 13th, at 12, a Splendid and Valuable Collection of FOREIGN PLANTS, comprising a superb assortment of Melocacti, Euphorbia, Aloes, Verbenas, Fuchsias, and other Stove and Greenhouse Plants; an excellent Tulip Stage and Utensils; also the surplus Household Furniture, a rich-toned 6½ octave Picolo. The whole the property of a gentleman removing. May be viewed the day prior, and morning of Sale; and Catalogues had on the Premises, and of Mr. Stone, 83, St. John Street, near Smithfield.

TO BE DISPOSED OF.—An Extensive and Old-Established COUNTRY NURSERY, where a considerable Business has been carried on for many years. Any respectable person with a knowledge of the business would find this concern worthy of immediate attention. Apply to Mr. George Gray, No. 23, New Corn Exchange, Mark-lane, London.

N.B.—None but principals will be treated with.

VALUABLE CHURCH-PREFERMENT.

TO BE SOLD, THE NEXT PRESENTATION to the RECTORY of RICKINGHALL INFERIOR, in SUFFOLK. The Incumbent is in the 68th year of his age, and the Net Income arising from the Commuted Tithes, Glebes, and Surplice Fees, average about 565*l.* per annum. Also, the NEXT PRESENTATION to the RECTORY of RICKINGHALL SUPERIOR, possessing a Net Income of 437*l.* per annum.

For further particulars apply to Mr. Butcher, Auctioneer, Norwich.

TO CAPITALISTS.

TO BE SOLD, to pay a clear Five per Cent., THE TOLLS arising from the Navigation of Vessels laden with Corn, Coals, Timber, Stone, &c. &c., passing along the River Waveney, from Beccles to Bungay, Suffolk, with a Capital Residence, Malting Office, Business Premises, &c., at Bungay.

The above Property is let on Lease at 1300*l.* per annum, six years of which Lease were unexpired at Lady-day last.

For Price and further Particulars apply to Mr. Butcher, Auctioneer, Norwich.

TO HORTICULTURAL BUILDERS.

A GENTLEMAN wishes for a PLAN and ESTIMATE for a small GREENHOUSE or CONSERVATORY, to be erected at the end of his Drawing-room (which end faces the west, and the front the south, and from which a door of communication opens), size 15 feet 6 inches by 12 feet; there is a return wall of 5 feet to be glazed with Drake's Sheet Glass, and finished in the best manner.—Direct to E. L., at the Office of this Paper.

The Gardeners' Chronicle.

SATURDAY, AUGUST 10, 1844.

THERE has lately been laid before the French Academy of Sciences a most important paper on FORESTING. The author, M. Chevandier, who appears to have the charge of one of the French forests, has been investigating the effect of water upon the produce of wood, and his results are not a little startling.

From a multitude of experiments made with trees growing on the sandstone of the Vosges, he has ascertained that, powerful an agent as water is well known to be, its effects are not in proportion to its quantity, but to the manner in which it communicates with the roots of trees. For example, he found that if the quantity of timber furnished by Spruce Firs in a given time, on a given space, in the swamps (*terrains fangeux*) of the Vosges is taken as 1, the produce in dry land will be about 2, in land so situated as to receive rain water as it falls between 4 and 5, and in stations where the soakage of running water maintains a continual freshness rather more than 6. He endeavoured, he says, to collect together all the cases where the same tree growing in the same soil and aspect, nevertheless had its roots in a different condition as to water. He felled them in large numbers, keeping an exact account of their age and of all the circumstances that appeared likely to have influenced their growth; and he found, upon comparing trees of the same age, growing in the same soil, that the differences produced by the action of water were constantly in the proportions above stated, so far as Spruce Firs are concerned, to which M. Chevandier's observations appear to have been confined.

The following figures, which have furnished the proportions alluded to, express the annual increase in dry wood of the Spruce Fir:—

	Kil.		Years.
Swampy land . . .	1.84	Mean age at which the Spruce is felled . .	101.88
Dry land	3.43	Ditto	71.57
Land watered with rain water	8.25	Ditto	74.45
Land watered with running water . . .	11.57	Ditto	99.45

In order to show more strongly the value of these considerations, M. Chevandier gives the following average rate of growth of the Spruce Fir, when about 100 years old:—

In swampy land less than .	1	kilogramme*
In dry land less than . .	3	,,
In land which is watered, about	20	,,

This gives for the total weight of a tree a century old—

100 kilogrammes	or ⅓ of a stere†
300 ,,	or 1 stere
2000 ,,	or 7 steres

according to the circumstances in which it has grown. "And if we calculate the value of a tree, reckoning its price to be according to its size, we arrive at this conclusion, that a seed of the Spruce Fir will become, at the end of a century, and according to the state of the soil with respect to water, a tree worth 1½ franc, or 7 francs, or 85 francs."

It is impossible to estimate too highly the value of facts like these, which deserve the most serious consideration of all planters. Nothing can show more clearly how much of the results of planting depend upon circumstances little taken into account. The value of irrigation in particular is very striking; and M. Chevandier strongly urges the owners of mountain woods to turn the favourable position of such places to account, by introducing a good system of ditching. The plan which he finds most advantageous is to cut on the hill-side horizontal ditches, about a yard wide and deep, and 12 to 15 yards apart, which will catch the rain as it runs down, and afterwards soak into each other, so that what the uppermost ditch loses the next below it receives, and so on. Such a plan has been carried into effect in the forests belonging to the plate-glass works of Clichy, and he finds it neither expensive to make nor to keep in good order.

The facts elicited by M. Chevandier's experiments have a very wide range, and affect every branch of husbandry quite as much as growing Spruce Firs.

OUR readers are aware that very shortly after the appearance of this Journal we pointed out the many advantages possessed by NEW ZEALAND as a country for agricultural and horticultural emigrants. From time to time we have produced evidence of the correctness of our original views upon this subject, which we have never found it necessary to modify in the smallest degree. Nevertheless, the colony has, as our columns have also shown, fallen into a state of the greatest embarrassment, and the operations of the New Zealand Company have been brought to a stand-still. It was our intention some time since to advert to this unfortunate state of affairs; but we have deferred doing so until the Report of a Parliamentary Committee, appointed to inquire into the state of New Zealand, should be made public. That Report is before us.

It now appears that the distress of New Zealand has arisen—not from bad climate, sterile or uncultivable lands, open roadsteads, or the operations of land jobbers—but from monstrous mismanagement on the part of the Government Officers. The Committee declare "that the difficulties now experienced in New Zealand are mainly to be attributed to the fact, that in the measures which have been taken for establishing a British Colony in these Islands, those rules as to the mode in which colonisation ought to be conducted, which have been drawn from REASON and from experience, have not been sufficiently attended to;" and they have passed a series of resolutions, very strongly condemnatory of the conduct of the Colonial Office, or its agents. They declare that the local authorities have made a treaty with the natives, which is only *a part of a series of injudicious proceedings;* that their acknowledgments of a right of property on the part of the natives in all the wild land *was an error which has been productive of very injurious consequences;* and that the non-settlement of land claims (one of the first duties of the Government officers) *has been productive of great confusion and mischief.*

All political discussion being studiously excluded from our columns, we forbear from making any remark upon this announcement of the Committee; indeed, we only produce it in order to show that no kind of reason exists why confidence should be shaken in the excellence of the soil and climate of New Zealand for the purposes of British cultivators, and that the disasters of the settlers are owing to misgovernment, and nothing else. We expect with impatience the evidence as to the capabilities of New Zealand that has been elicited by the Parliamentary inquiry, and shall take the earliest possible opportunity of making it known. In the mean while, it is most satisfactory to learn, that in spite of difficulties thrown in the way of the settlers by those whose duty it was to assist them, the colony is steadily rising into importance. In the words of the Report of the Directors of the New Zealand Company, dated July 31—"It appears that the natural resources of the country are sufficient to outweigh impediments to prosperity occasioned by misgovernment. In the midst of the anxieties produced by the massacre at Wairoa, and the continued operation of the causes of that calamity, five vessels in the course of three months sailed from Wellington for London, entirely laden with the produce of the Company's settlements, consisting of oil, whalebone, flax, ornamental woods, and wool."

ON THE PURITY OF WATER.

EVERY one is aware that water varies very greatly in nature—some waters being what is termed soft, and therefore well adapted for washing, and various domestic purposes; whilst other waters are said to be hard, and are unsuitable for washing, &c. In fact, when we examine the numerous operations in the arts, in which water is employed, we find that the successful performance of most of them is more or less dependent on the purity of the water employed. For some purposes soft water is requisite, whilst for others hard water is preferable.

The purity of the water employed for gardening purposes is a matter of considerable importance, and therefore the causes which affect its purity, the substances which modify its properties, and the methods of purifying it, are all subjects of some interest to the gardener. The natural waters of the earth—namely, sea and spring water—are hard; they are not pure water, but contain a portion of saline and earthy matter dissolved in them. Sea-water contains by far the largest quantity of these substances; but spring-water also contains them; and, in consequence, both these sorts of water are hard. In order to purify such water, we have only to boil it, and convert it into vapour by heat. Pure water rises in the form of steam; the impurities of the water are not volatile—they cannot be raised in vapour by heat: hence they remain behind, whilst the water is converted into vapour, and obtained quite free from impurity when the vapour is cooled or condensed.

When we thus distil water, we do that on a small scale which is every day taking place on a large scale all over the surface of the globe. The heat of the sun every day raises a large quantity of water in vapour from the surface of the land as well as of the sea; and this vapour returns to the fluid state when cooled, descending to the surface of the earth in the forms of rain and dew. Rain-water is as much distilled water as that prepared artificially in a still; and therefore, as rain-water is free from earthy and saline impurities, it is the softest of all natural waters.

A little consideration will convince us that though the water which comes from the clouds is pure and soft, or at most contains minute traces of such substances as it may find in its descent through the air, yet that when it reaches the surface of the earth and soaks into the soil, it must soon dissolve a small quantity of such salts of lime, &c., as the soil contains, and in consequence become hard again. The water of springs is always more or less hard, yet it has previously been soft, for springs are caused by an accumulation of rain-water, which has filtered or drained through the soil and strata below it, in passing through which it dissolves a small quantity of earthy matter, and in consequence becomes hard.

The substances which commonly exist in hard water are sulphate and carbonate of lime, either separately or together; and in greater or less quantity they give to most spring waters the character and property of hardness. Sulphate of lime, or gypsum, is soluble in water, but only to a small extent, 500 parts of water dissolving about one part of the sulphate, or in other words, every gallon of water being able to dissolve about 150 grains of sulphate of lime. Perfectly pure water does not dissolve carbonate of lime, but water which contains any carbonic acid gas readily dissolves a small quantity of carbonate of lime; now rain-water always contains a portion of this gas which it absorbs in passing through the atmosphere, and the presence of which does not give it any character of hardness, or at all interfere with its economical uses; hence rain-water is able to dissolve a small quantity of carbonate of lime, and therefore in passing through a soil containing either sulphate or carbonate of lime it dissolves a little of these substances, and becomes hard.

The water with which plants are naturally supplied, is the pure soft water which is condensed from the clouds; hard water containing much lime is not well suited for the nourishment of plants, and indeed the presence of any quantity of the salts of that earth in water, is found to kill many of the more delicate plants. It is obviously impossible to purify the water for gardens by artificial distillation, and besides it is generally unnecessary, for, as has just been stated, rain-water is distilled water, and it may readily be collected and preserved in tanks for use, for any reasonable time. Rain-water, which collects from a clean slate roof, contains nothing but a small quantity of carbonic acid, ammonia, and other matters derived from the atmosphere, which is greater of course in towns and the vicinity of places where much fuel is burnt, than in the free and open country. It also generally contains a small quantity of organic matter, derived from birds, insects, and other similar sources. These impurities, particularly if present in any quantity, cause a tendency in the water to become foul, but do not at all interfere with its uses for horticultural purposes. The water which drains from tile-roofs generally contains a portion of lime, derived from the mortar; but even then the quantity, except in particular cases, is but small. No good garden should be without rain-water tanks, well made, and properly covered, to prevent earth or rubbish falling in; and rain-water alone should be used for syringing, washing, or watering delicate plants. For common purposes, and where the supply of rain-water is insufficient, river or spring-water must be employed; but such water is always inferior for horticultural purposes to rain-water, being more or less contaminated with sulphate of lime.

Water which contains carbonate of lime, dissolved in consequence of the presence of carbonic acid, may be greatly improved by several means; if it be boiled, the carbonic acid gas is expelled; the carbonate of lime being then no longer soluble, falls as a white powder, and the water becomes soft. The same effect is gradually produced by mere exposure to air; it is found that spring-water of this kind, after some days' exposure, becomes milky, and throws down a quantity of carbonate of lime, as the carbonic acid is given off from the water. Lastly, such water may be purified by the addition of a little quick-lime, which takes the carbonic acid at once, forming carbonate of lime, which is insoluble, and therefore separates, together with that carbonate of lime which the water previously contained in solution, owing to the presence of carbonic acid.

Spring or river water, holding sulphate of lime in solution, may be purified by the addition of a little carbonated alkali; thus, when carbonate of potash or soda is added to such water, these salts decompose each other, sulphate of potash or soda is formed, together with carbonate of lime, and the latter, being insoluble, separates as a white powder. If only a small quantity of the alkaline carbonate is employed, it considerably improves the water, for the alkaline salts are less objectionable than the sulphate of lime. There is one practical difficulty in the use of this process, which is, that if the water contains any free carbonic acid, the presence of that substance prevents the precipitation of the carbonate of lime, by rendering it soluble in water; this can only be obviated in the manner before stated. Carbonate of ammonia would be far preferable than carbonate of potash or soda, inasmuch as the resulting salts of ammonia remaining in solution would be not merely harmless, but even beneficial; it is, however, unfortunately the case, that carbonate of ammonia does not precipitate lime so readily as the carbonates of the common fixed alkalies; the carbonate of lime formed remains in solution, in consequence of the presence of carbonic acid. Carbonate of ammonia contains,

* A kilogramme is about 2lbs. 3oz.
† A stere is rather more than 35 cubic feet.

in proportion, more carbonic acid than either carbonate of potash, soda, or lime; hence, when it decomposes salts of lime, there is more carbonic acid than the lime can combine with, and this excess, which remains in the water, renders the carbonate of lime formed also soluble. On the other hand, carbonate of potash or soda contain, in proportion, just as much carbonic acid as the carbonate of lime; consequently, when they are employed, there is no excess of carbonic acid set free, and the whole of the lime is precipitated. If, however, hard water of this kind is exposed to the air for some time after the addition of carbonate of ammonia, the whole, or at least by far the greater part of the lime is precipitated. Any liquid containing carbonate of ammonia (such as common liquid manure) may be used for this purpose; but it must always be remembered that the carbonate of lime will not precipitate until the excess of carbonic acid is expelled or has escaped.—*E. Solly.*

TREATMENT OF HALF-HARDY PLANTS DURING WINTER.

The two principal things to be guarded against in the preservation of half-hardy plants during the winter months, are frost and dampness—both very destructive in their influence, and both exerting that influence in a different manner. But although the natures of frost and dampness are of very opposite characters, and their modes of influence widely different, the presence of the one materially augments the influence of the other; and it follows, that by preventing one, we in a great measure guard against both.

The first thing, then, that should engage our attention, is dampness, for if this is present, frost is more severe. To prevent dampness there must be a free circulation of air; the plants must be placed on a dry bottom, and if they are in a situation which will admit of a fire occasionally, it will render the pits or house dry, but it should be used very sparingly, and only when absolutely necessary. When plants are housed for the winter, it is a common practice with many gardeners to plunge them (I speak only in reference to half-hardy kinds) in some moist substance, whereby they may, by the porosity of the pots, absorb sufficient moisture for their support, without having recourse to the watering-pot. There are no doubt many advantages in such a system, but the disadvantages far outweigh them. Damp is engendered; there is a continual evaporation going on; and if the weather should be such (as is often the case for weeks together) as to prevent the removal of the lights, in order to produce a free current of air, the moisture finds no means of escape, and thus accumulating, causes the young and imperfectly organised wood often to damp off. But even with all care and attention, damp will attack some plants, and generally those that are most succulent in their nature, or the young and tender tops of others. We should therefore watch narrowly, and remove every leaf or shoot affected, as damp not only destroys the individual immediately affected, but extends its influence to those in the neighbourhood of the one so affected. It is contagious. It engenders mould, which being a species of Fungus, is rapidly disseminated, attacking and destroying wherever the damp has prepared the leaves for its reception. Neither should plants be too much crowded, as that obstructs the free circulation of air.

Watering should of course be done sparingly, but still it will be required occasionally. Care, however, must be taken to preserve the foliage as dry as possible, as there being but little sun in winter, and that not of sufficient strength to evaporate the superabundant moisture rapidly, it quickly rots the leaves, especially of Pelargoniums, and similar plants having leaves which form a kind of dish in which the water accumulates in considerable quantities. When fire is had recourse to for drying the house or pits, choose a fine day, and give all the air possible, so that the moisture dislodged by the heat may be dispersed. It is an absurd custom (but still often practised) to attempt to dry a building by fire-heat when every aperture is closed. The damp is certainly removed from all the crevices, but the confined atmosphere becomes saturated with moisture, and coming in contact with the walls and other objects at a lower temperature than the atmosphere itself, this moisture becomes condensed, and runs down in streams, or stands upon the walls in large drops, not a particle of it escaping, there being no aperture for it to do so. Many plants are no doubt placed for convenience, and from other causes, in shady situations. Some kinds require such treatment. In all such cases, however, they should be removed, as autumn approaches, to some place where they may enjoy the full benefit of the sun and air, in order that their juices may become elaborated, and their young and tender shoots get well ripened.—*Walter Wakefield.*

Home Correspondence.

Fourcroya gigantea.—Two noble Agave-like plants in the stove of the Royal Botanic Gardens of Kew, which are considered to be the Fourcroya gigantea, Ventenat (*Agave fœtida*, L.), give promise of flowering in a very short time. They are nearly of the same size, caulescent; the stem is 2 feet 4 inches high, crowned with a noble tuft of sword-shaped leaves five to seven feet long, spreading in all directions, their thickened bases giving a height of 1 foot 2 inches additional (in all 3 feet 6 inches), from the summit of which, in the centre of the foliage, the flower-stalk springs. This flower-stalk was first perceptible on Wednesday of last week (July 24th); and attention was directed to it by a remarkable appearance of the plant, the thickened bases of the leaves separating, as it were, from each other, so as to leave a space between them, into which a penny-piece might be inserted, and the lower leaves falling down so as, in a measure, to conceal the stem. On the 28th July, Mr. J. Smith found that this flower-stalk had already gained a height of 6 feet 8 inches; and on the 30th, of 8 feet 6 inches. To-day (August the 1st), at noon, its height was 10 feet, and in girth, at the base, 1 foot $2\frac{3}{4}$ inches. Its present appearance is similar to that of a young shoot of Asparagus, but more tapering, coming indeed to a very sharp point at the top. The scales are distant, and the lower ones are beginning to spread, while the rest are pressed close to the stalk; but none of them exhibit at present an appearance of flower-buds. The growth of the flower-stalk in the two plants has kept pace, the one with the other, in a very remarkable manner; there is scarcely a perceptible difference in height between them, and as each is in a tub about 3 feet high, the whole height of the plants from the floor may be estimated, at noon on the 1st of August, at 16 feet 6 inches. The inside of the stove where they are placed being 26 feet high, some of our friends have congratulated us on having ample space, without removing the lights; but, calculating from the few instances upon record of the flowering of this stately plant in England, we must reckon upon a length of 30 or 32 feet from the flower-stalk; and instructions are already given for an opening to be made over each plant in the roof. Those of your readers who may be disposed to see them, will find them in the house usually called the Conservatory, or that one which is distinctly seen from the green (of Kew) before entering the gardens. Fourcroya gigantea appears to have flowered for the first time in Europe in the Botanic Garden of Schönbrun, Vienna, and it was figured by Jacquin, in the "Icones Plantarum Rariorum," vol. ii. p. 379. Its flowering panicle was 32 feet high. Another specimen blossomed in the Paris garden in 1723, and was figured by De Candolle in the "Plantes Grasses," tab. 126. Ventenat has given the height of the flower-stalk at different dates. It was from the 9th of August to the 4th of September before it had attained to 10 feet. By the 25th of October it had reached its greatest elevation, 22 feet; its more rapid growth having been checked by exposure to cold. In 1821, a Fourcroya gigantea blossomed at the seat of the Right Hon. Earl Powis, of Walcot, in Shropshire, and a figure was given of it by Dr. Sims in the "Botanical Magazine," tab. 2250. It had attained a height in the flower-stalk of 30 feet. None of the figures now mentioned give anything like a good idea of the stateliness of the species of Fourcroya, partly owing to the necessity of giving it upon a very reduced scale, and partly owing to the vast size of the panicle, in proportion to the foliage, gigantic as the latter are. The crown of leaves is in all shown to be sessile, or nearly sessile; whereas our plants are, as all authors describe them, caulescent. According to the first edition of the "Hortus Kewensis," it was cultivated at Hampton Court garden in 1690. Being a species of slow growth, it is possible the Kew plants may be of that age, and derived from Hampton Court. The Fourcroya longæva, of Karwinski, a species allied to this, is said by the Mexicans to flower only once in 400 years; but our species is but a dwarf in comparison of that, of which beautiful representations are given by Zuccarini, in the 16th vol. of the "Nova Acta Acad. Nat. Curiosorum," and which is said to have a stem 40 to 50 feet high, and a flower-stalk 30 to 40 feet high. — *W. J. H., Kew, Royal Botanical Gardens.*

Scorching Effects of the Sun.—The spotting of Vine-leaves under glass, so fruitful a source of speculation at present with your correspondents, and on which some conflicting opinions are entertained, depends in many instances on sun and water, but not in the manner pointed out by the lenticular theorists. A drop of water, as you have shown, on the surface of a leaf, cannot concentrate the sun's rays, so as to burn the leaf on which it rests. The under-surface of the glass of a hothouse, however, on being bespattered with water from a syringe or engine, will leave drops of water adhering to it, of various sizes and degrees of convexity, forming plano-convex lenses, which will concentrate the sun's rays and act as burning-glasses on the leaves adjacent, scorching them with brown spots and destroying their beauty, independent of the loss of green surface for the vital functions of the plant. Although pointing this out as one of the causes of the spotting of the Vine and other plants near the glass of hothouses, I would by no means hold it forth as the only one; but the above may satisfy the anti-lens gentlemen that water may burn the leaf of a plant, although not exactly in the way hitherto held out by the opposite party. Scoresby, when in Greenland, set fire to gunpowder with a double-convex piece of ice; no wonder then that a leaf may be scorched with a plano-convex lens of water.—*Vidimus.* [With much deference to our correspondent, we must regard his explanation quite as unsatisfactory as the others. Water lenses will no doubt act as well as those of glass or ice: but how do the lenses get into focus? Are not the leaves too far off the glass? And do not the drops of water shift and change their form, and run down the glass before they can act? Besides other obvious difficulties.

Scorching Effects of the Sun.—I have a plot of Scotch Firs two to three feet high, about 5000 in number; on the night of the 25th July it was a drizzling rain, and the next morning, being the 26th, the sun got out very hot; early that morning, about 9 o'clock, I passed by them and found them quite brown, and now they look as if they had had a fire amongst them. This must either be the effect of the sun and dew, or there must have been a frost in the night; but either way the sun must be the cause of it. The plot faced the east; on the north-west side I had several plots of Scotch and Larch, and only a few scorched. I perceive for the last month in this neighbourhood we have had several frosts in the night.—*F. X. O., Cliff Vale.* [This is a specimen of the sort of reasoning applied to this subject. The scorching was caused by the sun, or the dew, or the frost—or something else. Very likely; but by which? Not by the sun, because the same thing happened on the north-west side.]

Charcoal, Preparation of Cuttings, &c.—The following are the results of a few experiments relative to the application of charcoal in the propagation of plants, and also on the preparation of cuttings for insertion. In the spring of 1842, I propagated a considerable number of various kinds of plants in different ways, and some of these in charcoal; I sifted some rather fine, into which I inserted cuttings made from the young wood of Abutilon striatum, and Lantana Sellowii, together with others made from Fuchsias, and various other kinds of greenhouse plants: these became well rooted in a comparatively short space of time. The Abutilons emitted roots in great abundance, and seemed particularly fond of charcoal-grains, small particles of which adhered to the rootlets in great quantity. These cuttings were inserted in charcoal alone; but notwithstanding the success attending the experiment, I prefer mixing the charcoal with a little good soil and silver-sand. Sand is, no doubt, the best ingredient for propagation, but where it is scarce (as it is in some places), charcoal will be found advantageous. I also used charcoal in propagating Pelargoniums, for which I prepared a mixture of charcoal and loamy soil of about equal parts; the charcoal was not sifted very fine; 48-sized pots were used, at the bottom of which I placed a little Moss, and filled up the remainder with the prepared compost. I inserted one cutting in the centre of each pot, and the whole of the pots were plunged to the rim in the bark-bed in a propagating-house, containing a gentle and steady heat. I never saw cuttings do so well as they have done, many as I have seen; in the space of ten days or a fortnight the roots were protruding through the bottom of the pots. The cuttings were then taken out of the bark-bed and hardened off, and in a short time they became fine healthy plants; although it was evident that the compost was suitable for them, it is not to that alone that I ascribe my success, but, in a great measure, to another cause, viz. that of properly preparing the cuttings. It is the common practice to cut through the joint and remove three or four of the lowermost leaves, but the removal of these (I am fully convinced) is of great disadvantage, as it is generally admitted that the foliage has an office to perform, viz. that of elaborating the sap or juices of the plant. The sap ascends up the minute vessels of the cuttings, and, entering the leaves already formed, and undergoing the elaborating process, is converted into cambium, or the proper juice of plants, by exposure to the influence of light and heat. Afterwards it descends, forming wood in its course, but in considerably less quantity in cuttings than in rooted plants. After it has reached the base of the cutting, it comes into immediate contact with the soil or compost, of whatever nature that may be, and there it assumes a congealed appearance, or white warty substance, which, owing to the sap continually descending, enlarges until it is forced into different directions in the shape of roots. These supply the plant with food, growth commences and proceeds, and the plant elongates and soon becomes established. If we deprive a cutting of its lowermost leaves, we deprive it of a considerable portion of its power to emit roots. I have inserted a great quantity with every leaf attached, and these retained the same healthy appearance as before they were taken off the parent plant; many of them rooted rapidly, and not one leaf died until after they had become well-established plants. It is evident that the leaves were of service to the cuttings, from their remaining so healthy; these cuttings were inserted deep enough to bury in the soil the whole of the leaf-stalk of the lowermost leaf. It is worthy of remark that those cuttings having the largest leaves, rooted quickest; thus showing that the descent of the sap was stronger and quicker in them than in others with smaller foliage, but which, nevertheless, also succeeded well. How different was the case of some tried on the old plan of removing the leaves! Many soon became languid, some ultimately withered away, and those which did succeed were much slower in emitting roots. In removing the leaves, generally a small portion of the foot-stalk is left, which sap enters, but on account of the leaf being absent, is not elaborated; consequently, these become dropsical, and damping off very often, kill the cutting. This would not have been the case, had the leaves been left on. In preparing cuttings, do not cut through the joint, but close at its base, as the vessels connected with the lowermost leaves are then retained entire, which is an advantage not to be lost sight of; the cut should be made with a sharp knife, in order that the cutting may not receive the slightest bruise. For fear of disorganising the vessels, the cut should likewise not be suffered to become dry before insertion, as this to a great extent deprives the cutting of the power of absorption, and perhaps, in some plants, altogether. Shading is another essential point. Plants breathe, as it were, rapidly under the solar influence; consequently cuttings, being without roots, are not possessed of sufficient power of absorbing a requisite quantity of moisture to counterbalance the evaporation, and the consequence is (if shading is not resorted to) the cutting very quickly flags or droops, and is soon past recovery. To allow them to flag at all, is giving a severe check to the whole system, and in order to obviate this, recourse must be had to

shading. With regard to the Pelargonium, I would state, that to retain the leaves on the cuttings is highly serviceable. This, however, does not answer all plants indiscriminately; for on many of the hard-wooded kinds the leaves have either none or but very short footstalks; in such cases, then, a few of the lowermost leaves must be taken away; for, if buried in the soil, they rot, and destroy the cuttings. But, with these exceptions, there is much advantage in retaining all the foliage entire. With respect to charcoal, I may state that, for Salvias, Petunias, Fuchsias, Verbenas, Heliotropiums, Anagallis, &c., together with several climbers, as Cobæas, Lophospermums, and the like, charcoal is an excellent ingredient in their propagation, when mixed with a portion of good soil. For drainage also its value is well known, as on account of its open, porous nature, it admits a free passage for water.—*H. A. Wood, Statfold Hall.*

Pine-apples.—The perfection of Pine-growing is to produce them throughout the whole year; and to accomplish this desirable object is the ambition of all gardeners who have them in constant demand. This regular and continued supply is not to be afforded by subjecting the entire stock to one uniform treatment and temperature, or to have the plants of one age and size. Supposing, for example, a house 100 feet long, and of the usual width, divided into three compartments—plants of the same size are placed in each, and each division heated to the same temperature, and a healthy growing atmosphere maintained; the result, under such circumstances, will be nearly the same, although each of the divisions may be differently arranged, as long as the temperature and treatment nearly assimilate. If "A. B. C." had attentively studied this important part of the alphabet of Pine-growing, he would not now be living in dread of all his Pine-plants coming into fruit at once, and in autumn. Had "A. B. C." selected those plants which were likely to come up first, and which the practised eye can easily detect, and placed them in one of the divisions of his house, and then maintained a higher and drier temperature, the result would have been other than disappointment. Mr. Macintosh knows, as well as any man, the value of a good Pine-apple at Christmas; hence the remark alluded to by "A. B. C." applies, in all probability, to such plants as are very small, or mere suckers, as no gardener, in these days, would think of casting to the rot-heap such plants as those described by "A. B. C." merely because they were about to afford him good Pine-apples during winter.—*R. Glendinning.*

Pine-apples.—In a late Number are some remarks on the Pine-apple, by Mr. Roberts, who writes thus:—"I do not agree with a statement in Macintosh's 'Practical Gardener,' which says, that Pines starting into fruit in August are tantamount to being lost;" but waving this statement, I proceed to another in the same communication, where Mr. Roberts says that Queens showing fruit in August, would ripen good fruit by the end of October—a space of little more than two months. Now, I beg to say, that neither Mr. R., nor any other person, ever did, or ever can produce a good fruit in so short a time, and in particular at that season of the year.—*M. S.*

Bees.—Amongst the great mass of useful information which weekly issues from your Journal, can you supply a poor persecuted amateur bee-keeper with directions how to make himself more agreeable to his bees? I have heard that these little vicious creatures entertain strong aversion to some persons, and I am almost constrained, from the sad experience I have had of their attacks on my own person, to coincide in the opinion. I have been stung five times this season; twice for just peeping at them through one of their side-windows, while they were at work, and on the other occasions I was at least a dozen yards from their dwelling. On last Friday, while working in my garden, some 14 or 15 yards in an opposite direction to their straight flight from the hives, I heard, about my head, a fierce buzz, which I was aware portended mischief, and before I could either run, or guard against the impending danger, I received my assailant's venomous weapon in the most prominent feature of my face; the little wretch tugged and tugged to recover its lance, but so deeply fixed was it, that to extract it proved beyond its power. I immediately hastened into the house, and having pulled out the sting, I applied liquor-potassæ, which I had seen recommended in a Number of the *Chronicle*, as a certain cure; but, alas! so rapid was the course of the virus that it seemed to have outstript the remedy which I was led to anticipate from the alkali; for after assiduously applying it till the part was completely blistered, my nose became twice its natural size, to the horror of my wife, and the scarcely suppressed mirth of my children; the swelling quickly spread over one side of my face. To market it was impossible to venture the next day, and even on Sunday I fear I was considered to carry a double face in church. Now, Sir, can any of your scientific or learned contributors suggest a remedy for my distressing case? What can put me on good terms with my bees? And if this be impracticable, is there no infallible means of counteracting the effects of their sting? Dr. Bevan mentioned volatile alkali as preferable to liquor-potassæ; if hartshorn be meant, I beg to state that in my case that has failed to afford relief. Pray pity my condition, and recommend an antidote to *A would-be Lover of Bees.*

Bedding out Plants.—When I plant out a bed of anything, if the season is likely to be dry, I first make a hole for the plant, and in the bottom of this I put some rotten dung, or any sort of material that will retain water; I water this well, and then put in the plant, filling the hole to within two inches of the surface; I again water well, and then fill up the hole, and in this way I proceed with all the rest. If I am obliged to water the plants afterwards, I cause the beds to be hoed over next day, as soon as they are dry enough; plants do better under this treatment than by watering them so much as is usually done; when there is no appearance of dew I damp the leaves over late in the evening. If I was to plant a bed and water it all over, it is very probable the roots that were deep in the soil would possibly not be touched, consequently they would naturally come to the surface in search of food, and next day when the water is all evaporated, they are left under the influence of a scorching sun. Now, if we can keep roots down until the bed becomes covered with foliage, the shade soon brings the roots to the surface; for instance, if we take a Pelargonium in a pot exposed to the sun, the roots are all at the bottom; but shade the soil with Moss or a similar material, they will come to the surface, and so it is with a bed of plants in the flower-garden.—*A. Threlkeld, gr. to J. Marshall, Esq.*

Bedded-out Plants.—I beg to differ from the statement of "W. P. A." respecting bedded-out plants in flower-gardens, for at the present time I could not possibly wish to see the beds here, one and all of them, in a more flourishing condition; the plants are looking well, both with regard to foliage and flower, and that without the use of the watering-pot, which has not been once employed since the time of planting out. The manner in which the beds are prepared is described at p. 619, 1842, and I imagine, if the soil is prepared as is there stated, that even in a season like this there will be no need of the watering-pot, shading, &c., which in nine cases out of ten does more harm than good.—*J. Clarke, Tandridge Court, Surrey.*

Gooseberries.—We have received from Mr. John Fardon, of Woodstock, the following statement of the weight of Gooseberries shown by him at Oxford, for which he obtained first prizes:—

Red.	Dwts.	Grs.	*Green.*	Dwts.	Grs.
London	30	0	Peacock	26	4
Ditto	29	0	Ditto	25	18
Yellow.			*White.*		
Leader	23	14	Chorester	22	6
Ditto	22	4	Ditto	21	12
Total				200	10

Growth of Forest Trees.—The following passage occurs in Gilbert White's "Miscellaneous Observations" appended to most editions of his "Natural History of Selborne," and it in some measure illustrates this subject, on which you reply to "A Subscriber" in a late *Chronicle.*—*T. B., Selborne.*—"It has been the received opinion that trees grow in height only by their annual upper shoot. But my neighbour over the way, whose occupation confines him to one spot, assures me that trees are expanded and raised in the lower parts also. The reason that he gives is this: the point of one of my Firs began for the first time to peep over the opposite roof at the beginning of summer; but before the growing season was over, the whole shoot of the year, and three or four joints of the body beside, became visible to him as he sits on his form in his shop. According to this supposition, a tree may advance in height considerably, though the summer shoot should be destroyed every year."—*White's Selborne.*

Strawberries.—In all probability it is mice that have cut off "εγρεφον's" Elton Pine Strawberries, while green, close to the calyx. If he examines them he will find that they are divested of a great portion of their seed; I have suffered this season from the same depredators to a considerable amount. The remedy I employed was kitchen droppings mixed with arsenic: spread this on thin slices of bread, cut in small pieces; late in the evening lay it round the beds, and on the following morning pick up what is not used. With one application only I have got clear of the pests.—*R. Allan.*

Wasps.—These are very abundant this season, and great is the havoc they are making amongst the fruit. I have already destroyed upwards of 70 nests. My method of destroying them is very simple and effectual. I mix sulphur and gunpowder in about equal quantities, with a little water, to the consistence of a thick paste, and while this is soft, I cut it out into pieces of about a quarter or half an inch thick and an inch long, and when dry I roll each piece in a bit of match-paper. In applying it to the nest, I take a piece of stick and cleave it at one end; in this I fasten one end of the match paper, ignite the opposite end and hold it to the hole of the nest, and, allowing it to explode, I stop the hole with a clod or my foot, in order to prevent the smoke from escaping. In an instant the wasps are suffocated. I then dig out the combs and mix them up with the earth, for if they are not dug out and destroyed, they recover from their suffocation. — *R. Allan, Drumbanagher.* [Turpentine is a far better remedy, as Prof. Henslow stated last year.]

Societies.

HORTICULTURAL SOCIETY.

August 6th.—R. W. Barchard, Esq. in the Chair. The Marquess of Titchfield, Lord Saltoun, Sir F. Goodricke, Bart., Sir J. W. Guise, Bart., Sir H. Webster, Colonel R. Ferguson, G. G. Kirby, Esq., H. R. Yorke, Esq., M.P., T. Kelsall, Esq., W. Williams, Esq., T. Rawsthorne, Esq., and F. L. Popham, Esq. were elected Fellows; and Dr. T. Cantor, of Penang, a Foreign Corresponding Member. The Exhibition included several objects of great interest. Two magnificent specimens of Fuchsia exoniensis were contributed by Mr. Ayres, gr. to J. Cook, Esq. This Fuchsia is well known to produce flowers of the finest colour and best form; but when it was shown at a former Exhibition, some doubts were entertained with respect to its habit of growth. Mr. Ayres's specimens, however, furnished ample proof that this kind has not only the finest blossoms of any sort we yet possess, but has also an excellent habit. These plants were upwards of 5 feet high, and their gracefully drooping branches covering the pot, were loaded with blossoms, and were clothed from top to bottom with abundance of fine healthy foliage.—From the same gardens were Pentas carnea and Achimenes multiflora in very fine condition, and also another sort named Beatonii, bearing much resemblance to the old A. coccinea; together with a most beautiful Clerodendron paniculatum, in a state of great perfection, producing a spike of flowers fully 18 inches long. A Knightian Medal was given for this, and a Banksian was awarded to the three first-mentioned plants.—Mr. Mountjoy, of Ealing, was awarded a Knightian Medal for a most beautiful specimen of the red-flowering Lilium speciosum, having 4 branches, bearing no less than 70 of its showy blossoms. From the same collection was also Pentas carnea, a Gladiolus named Glory of Ghent, with large vermilion and yellow flowers, and apparently raised between G. cardinalis crossed with psittacinus, and specimens of Phlox Van Houttii, which, on account of its beautifully-striped flowers, is so great an acquisition to hardy herbaceous plants. Mr. Mountjoy also sent Gloxinia cerina, flowers of a seedling Loasa, and a Plectranthus with pale-blue flowers.—Mr. Edmonds, gr. to the Duke of Devonshire, received a Knightian Medal for an excellent Cattleya crispa, in good health, and having 5 fine spikes loaded with showy blossoms.—From Messrs. Henderson, of Pine-apple Place, were Cleome pentaphylla, Linaria triornithophora, called fissa, and a fine mass of Achimenes hirsuta, in profuse bloom, growing in a shallow pan. Messrs. Henderson stated that they grow all the varieties of Achimenes in shallow pans, and they imagine that the plants flower much better under such treatment than when they are planted in deep pots. It is probable that this, as well as some of the other sorts which are apt to become too luxuriant, and consequently flower but sparingly, would do better if they were grown on blocks, and were treated similarly to Orchidaceous epiphytes. This has been partly proved in the Garden of the Horticultural Society, where a bulb of A. pedunculata accidentally got into the Moss on a block along with one of the Orchidaceous plants, where it is now growing, and although one of the worst of them to flower, it is quite a mass of bloom. Messrs. Henderson also sent a new Heath, named Hendersonii, with bright pink flowers; and a fine specimen of Babingtonia camphorosmæ, a fine autumn-flowering plant, with Heath-like foliage, and producing fine spikes of delicate pink blossoms; a Banksian Medal was awarded for the Heath, Babingtonia camphorosmæ, and Achimenes hirsuta.—From Mr. Jackson, of Kingston, was a Lobelia-looking plant, with dark purple flowers, belonging to the genus Tupa, but named a species of Cristaria. It was from South America, and is new to gardens.—Mr. Robertson, gr. to Mrs. Lawrence, sent a plant of the very useful Niphæa oblonga, Oncidium Papilio superbum, volubile, and Stanhopea graveolens, called a variety of oculata; the pale variety of Cattleya Mossiæ, with large showy lilac blossoms; the insignificant-looking but rare Epidendrum glaucum, and another Orchidaceous plant, having small green flowers, with the lip striped with brown; several fine specimens of Heaths, and a magnificent Cuphea Melvilla, covered with blossoms, for which a Knightian Medal was awarded.—From the garden of G. F. Cox, Esq., of Stockwell, were some good Orchidaceous plants, including Cymbidium lancifolium, Cycnoches ventricosum, Catasetum Russellianum, with watery-looking pale-green flowers; the rare Sophronitis cernua, Eulophia cochlearis, small, but in good health; Oncidium Papilio, and the red and white varieties of Lilium speciosum, together with the beautiful Dendrobium chrysanthum, and the true Stanhopea oculata, for which, as well as for the Dendrobium, a Banksian Medal was awarded. — Good specimens of Fuchsia exoniensis were contributed by Mr. Kendall, of Stoke Newington, and Mr. Chandler of Vauxhall, confirming the fact so abundantly proved by Mr. Ayres's plants, that this Fuchsia has an excellent habit. Mr. Kendall also sent a seedling Pelargonium, named Warrior.—From Messrs. Lane and Son was a seedling Fuchsia, named Beauty Supreme; and another, called Pickwick, was from Mr. Cormack, of Deptford.—A specimen of the pale variety of Catasetum maculatum was sent from the garden of J. H. Schroder, Esq., of Brixton.—Messrs. Veitch and Son, of Exeter, exhibited what they considered to be a new species of Cyrtopodium, sent from Peru by their collector, Mr. Lobb, but which appeared to be only a pale variety of C. punctatum; and likewise Torenia asiatica, not of sufficient beauty to render it of much moment in a horticultural point of view.—Of Fruit there were some good specimens. Mr. Henderson, gr. to Sir G. Beaumont, Bart., was awarded a Knightian Medal for two fine Queen Pine Apples, weighing 4 lbs. 5 oz. and 4 lbs. 6 oz. They had small crowns, were perfectly ripened all over, and although not so large as some that have been formerly exhibited, they were excellent specimens of good Pine-growing. Mr. Henderson also showed another, called a Globe Pine, weighing 4 lbs. 5 oz.—From Mr. Fish, gr. to H. H. Oddie, Esq., was a Providence Pine, said to have been produced by a plant only 15 months old; it was not a remarkable specimen of growth—the weight, which was 7lbs. 2oz., was its principal merit. Mr. Fish also sent specimens of his hardy green-fleshed Melon, the heaviest of which weighed 6 lbs.—Mr. Povey, gr. to the Rev. J. Thornycroft, received a Knightian Medal for a Providence Pine, weighing 8 lbs. 13 oz., and measuring 22 in. round, and 7¾ high—the number of pips in height was 10.

It was a remarkably handsome fruit; the crown was, however, rather large.—Mr. Hamp, gr. to J. Thorne, Esq., showed a Queen Pine, weighing 3 lbs. 14 oz., and a Black Jamaica of the same weight; they were stated to have been grown on the tank system.—Finally, Mr. Belton, gr. to C. Winn, Esq., was awarded a Banksian Medal for a handsome Brown Providence Pine, weighing 6 lbs. 11 oz., and measuring 18 in. round and 9 in. high. Mr. Belton stated that the plant from which this was cut is only 12 months old; the sucker was taken off the old stool without roots in 1843, it was potted, and in February last was turned out of the pot into the bark-bed and planted in chopped turf mixed with a small quantity of charcoal. The plant had been only five times watered with liquid manure since February. Mr. Belton writes, that beside this, three other plants of the same age produced fruit each exceeding 6 lbs. in weight. —Mr. Barker, gr. to the Rev. T. Thurlow, sent a large mass of the fruit of Musa Cavendishii which was over-ripe in the centre, while the point was quite green, thus showing the fruit, which ripens in succession, in the different stages of growth.—Specimens of a Seedling Cherry were sent by Mr. R. Buck, of Blackheath.—R. Thompson, Esq., of Stansly Hall, received a Knightian Medal for 3 fine bunches of Black Hamburgh Grapes, the heaviest of which weighed 1 lb. 8 oz.; and also for three beautiful bunches of Black Prince, (called Lombardy) weighing 1 lb. 8 oz. and 1 lb. 6 oz.—From the garden of the Society was the well known Mormodes aromaticum, Catasetum Russellianum, and a new variety of Dendrobium secundum, received from Mr. Fortune, who found it growing about Anger Point. It produces beautiful racemes of dark purple blossoms, which are quite different from the pale flowers of the old species. From the same collection was also the new Achimenes picta, which independently of the beauty of its flowers has a pretty grayish-striped foliage that the others do not possess. Along with this was A. longiflora and grandiflora, the smaller variety of Erica cubica, the well known Stephanotus floribundus, Statice Dickensoni, Myoporum parvifolium, Chironia frutescens, and a collection of cut flowers of Verbenas.

COUNTRY SHOWS.

Royal Berkshire Horticultural Society, July 26.—This was the second Show for the season. The following is a list of Prizes:—*Carnations*, 1, Mr. Willmer, for Taylor's Marquess of Westminster, Willmer's Bompland, Middlesex Hero, Fulbrook's Grenadier, Smith's Mrs. Betts, Wilson's Harriet, Strong's Duke of York, Defiance, Brown's do., Watts's Bishop of Gloucester, Jacques's Phœbus, Hedley's William Cobbett, Duke of Northumberland, Hepworth's Brilliant, Babbins's Squire Mayneau, Soorn's Duchess of Kent, Holmes's Count Paulini, Willmer's Prince of Wales, and others. 12 *varieties*, Messrs. Tyso and Son, for Stone's Venus, Brooks's Flora's Garland, Brinkler's Defiance, Ely's Mr. Fuller, Conquering Hero, Twichett's Don John, Pearson's Enchantress, Headly's Achilles, Smith's Duke of Wellington, Hero of Middlesex, Turner's Princess Charlotte, and Wilson's Harriet. *Amateurs' Class*—12 *varieties*, Rev. A. H. [illegible] Duke of York, Brinkler's Defiance, Colcutt's Victoria, Hales's Prince Albert, Strong's Esther, Duke of Northumberland, Ely's Lord Milton, Ely's Lady Ely, Soorns's Bloomsbury, Brown's Bishop of Gloucester, Mansley, and Beauty of Woodhouse. *Picotees*, 1, Mr. Willmer, for Wells's Duke, Mussen's Charlotte, Jessop's Sir W. Middleton, Ely's Criterion, Gidden's Miss Hennell, Teazer, Lydia, Barnard's Mrs. Barnard, Gidden's Sir R. Peel, Trude's Queen Victoria, Kirtland's Princess Augusta, Sykes's Eliza, Willmer's Princess Royal, Queen Adelaide, Wildman's Isabella, Barrard's Borderer, Ely's John Bull, Green's Victoria, Crask's Victoria, and Gidden's Vespasian. 12 *varieties*, 1, Rev. A. H. Matthews, for Willmer's Princess Royal, West's Matilda, Burroughs's Mrs. Beavon, Matthews's Enchantress, Tollworthy's Isabella, Sir William Middleton, Matthews's Cynthia, Green's Victoria, Crask's Victoria, Briskler's Perfection, Matthews's Regina, and Trip to Cambridge; 2, Mr. West, for Gidden's Princess Royal, Trip to Cambridge, Gidden's Vespasian, Matilda, Sharp's Fair Flora, Kirtland's Queen, Turner's Queen, Nos. 24, 31; 3, Mr. Costa, for Princess Royal, Wilson's Pluperfect, Trip to Cambridge, Wain's Victoria, Costa's John Hampden, Kirtland's Queen, Costa's Venus, West's Matilda, and No. 4.

Guisbro Horticultural Society, July 25.—This was the first meeting for this season. Several prizes were awarded, but we have only received a list of rewards, without the names of the flowers for which they were given.

Northampton Horticultural Society, July 30.—At this, the Annual Meeting, the following prizes were awarded:—*Scarlet Bizarres*: 1, Mr. Holliday, for Harvey's Conqueror; 2, Mr. Jenkins, for Martin's Splendid; 3, Mr. Jacquest, for the same. *Crimson Bizarres*: 1, Mr. Holliday, for Ely's Lord Milton; 2, Mr. Cheny, for Wakefield's Paul Pry; 3, Mr. Carter, for the same. *Scarlet Flakes*: 1, Mr. Carter, for a seedling; 2, Mr. Holliday, for Addenbrooke's Lydia, 3, Mr. Archer, for Wilson's William the Fourth; 4, Mr. Cheny, for Chadwick's Brilliant; 5, Mr. Hardwick, for a Seedling. *Rose Flakes*: 1, Mr. Holliday, for a seedling, called Duchess of Buccleuch; 3, Mr. Bullock, for Sir George Crewe; 4, Mr. Hardwick, for Lady Ely; 5, Mr. Bullock, for Sir George Crewe. *Purple Flakes*: 1, Mr. Weston, for Harvey's Commander; 2, Mr. Holliday, for Evans's Queen Victoria; 3, Mr. Carter, for Village Maid; 4, Mr. Holliday, for Queen Victoria; 5, Mr. Cheny, for Bellerophon; 6, Mr. Jenkins, for Commander; 7, Mr. Perkins, for Ely's Mango. *Red Picotees. Heavy-edge*: 1, Mr. Jacquest, for Martin's Prince George; 2, Mr. Weston, for the same; 3, Mr. Jenkins, for Orson's Adelaide; 4, Mr. Carter, for Sharp's Duke of Wellington; 5, Mr. Bullock, for Prince George; 6, Mr. Archer, for Duke of Wellington; 7, Mr. Holliday, for Barrand's Cornelius; 8, Mr. Hardwick, for Duke of Wellington; and 9, Mr. Perkins, for Prince George. *Red, Light edge*: 1, Mr. Bullock, for Wood's William the Fourth; 2, Mr. Holliday, for Holliday's Henrietta; 3, Mr. Carter, for Gidden's Teazer; 4, Mr. Cheny, for a seedling; 5, Mr. Archer, for for Wood's Queen Victoria; 6, Mr. Jenkins, for Teazer; 7, Mr. Weston, for Weston's Surprise; 8, Mr. Hardwick, for Sharp's Hector. *Red, Feathered-edge*: 1, Mr. Archer, for Orson's Adelaide; 2, Mr. Holliday, for Duke of Wellington; 3, Mr. Perkins, for Martin's Grenadier; 4, Mr. Hardwick, for Duke of Wellington; 5, Mr. Jenkins, for Martin's Ruler; and 6, Mr. Carter, for Teaser. *Purple Picotees, Heavy edge*: 1, Mr. Holliday, for Kirtland's Princess Augusta of Cambridge; 2, Mr. Bullock, for Boothman's Princess Victoria; 3, Mr. Hardwick, for a seedling; 4, Mr. Carter, for Princess Victoria. *Purple, Light-edge*: 1, Mr. Holliday, for Ely's Grace Darling, 2, Mr. Carter, for Kirtland's Princess Victoria; and 3, Mr. Jacquest, for the same. *Purple, Feathered-edge*: 1, Mr. Holliday, for Wilson's Pluperfect; 2, Mr. Jenkins, for Sharp's Invincible; 3, Mr. Jacquest, for Brinkler's Juliet; 4, Mr. Hardwick, for a Seedling; 5, Mr. Weston, for Gill's Enchantress; and 6, Mr. Bullock, for a Seedling. Extra Prizes.—*Pan of Scarlet and Crimson Bizarres*: Mr. Holliday, with 2 of Harvey's Conqueror, and 1 of Martin's Splendid scarlet Bizarre, and 2 of Mansley's Robert Burns, and 1 of Ely's Lord Milton's crimson Bizarre. *Pan of Carnations*: Mr. Holliday, with Harvey's Conqueror scarlet Bizarre, Lord Milton crimson Bizarre, Marquess of Granby, scarlet-feathered; Lady Ely, red-feathered; Evans's Queen Victoria, pink-feathered. *Light-edge Picotee*, Mr. Archer, with Brinkler's Purple Perfection.

Reviews.

Spain and the Spaniards, in 1843. By Capt. S. Widdrington, R.N., F.R.S. 2 vols., 8vo. Boone.

The author of these volumes is already advantageously known by his "Sketches in Spain," published some years since—a work which gives us the only account of Spanish natural history which is to be found in modern English literature. When Captain Cook (now Widdrington) returned from Spain with accounts of new Pines, Oaks, and other plants, to be found in a quarter of Europe so often visited by English, his statement excited no little surprise; and it was only by raising them from seeds, and cultivating them in our gardens, that their existence, as new species, was satisfactorily established. It was, therefore, with no small interest that we commenced the perusal of his new volumes, and we have not been disappointed.

When the learned professor of chemistry at Oxford volunteered to explore the localities in Spain where phosphorite was said to exist in such abundance as to offer an inexhaustible supply of phosphoric acid to our agriculturists, Captain Widdrington agreed to accompany him. The work before us is the result of that tour, extended through Navarre, the Castiles, Estremadura, Grenada, Leon, the Asturias, and Galicia; during which every opportunity of acquiring information regarding the social, political, artistical, and agricultural condition of the people was seized by one thoroughly acquainted with their language and customs.

The phosphorite, the great object of the journey, was found at a place called Logrosan, in the heart of Estremadura, so far removed from the coast as to leave small hope of its being possible to export it profitably, even if it were in great abundance. But in fact the quantity appears to be inconsiderable compared with the reports that had been heard of its abundance.

"The town of Logrosan stands upon and is chiefly built out of a mass of very hard and compact schist, mostly black, with large veins of quartz. The beds of this slate are nearly vertical, and run from S.S.W. to N.N.E., being in fact part of the great system of Estremadura. The vein or bed of phosphorite appeared to me to be conformable with these slates, and from observation at the junction near the road where it is best seen, would appear to have been raised together with them; at least I could come to no other conclusion. It appeared to me quite independent of the granite and other formations, and to belong entirely to the slate. The vein is of unknown depth, the quality improving as you descend, according to the accounts of the people, borne out by our own observations. In general it is about six or seven feet in thickness, but in the lower division rather more; and also at the higher extremity appeared to widen very considerably. It is, however, not pure throughout this width, but passes into silex, and some pieces were sufficiently hard to form flints before the introduction of percussion locks. In some parts it has a chalcedonic appearance, and I received a cut in my hand by a fragment, whilst working with the hammer, quite as clean as if done with a knife. By the great kindness of Señor Luna we were allowed to dig or do what we liked, and to carry away any quantity of the mineral Dr. Daubeny might wish, with a view to the future analysis. We accordingly determined to take four mule loads, each load or carga being calculated at eight arrobas, or 200 lbs., which quantity was put into two strong bags made of the coarse linen woven in all these towns. From the specific weight being very great, the cargas when made up had the appearance of lead or other heavy mineral. The distance to Seville is about five days' journey, and the contract was made to convey it at so much per carga, return of course included. The terms were extravagantly high, and quite out of the question for anything except experiment, but we had no remedy: should any quantity ever be required, it must be sent by cars round by the high road of Merida.

"After the requisite quantity had been quarried, which was soon done, we selected the most pure samples for packing up, and although this appeared to be the best site for quarrying the mineral, at least one-half was useless, from its being so siliceous. The finer parts have a purple and white laminated and reniform structure, like some depositions of carbonate of lime. It is extremely phosphorescent when pulverised and thrown on coals or charcoal; and there is no doubt the accidental discovery of this circumstance, and its very different appearance from any of the adjacent rocks, originally led to the discovery of its existence in this remote and little-frequented district."

We regret that our limited space should prevent our making many extracts from this interesting work. We must, however, find room for the author's account of a Spanish Oak:—

"From the southern verge of the Serrania de Ronda, above Marbella, I have traced it, during my various tours, to the centre of the mountains of Leon, almost to the water-shed of Asturias, and from the Alcarria above Guadalaxara, to the western parts of the Sierra de Morena. The tree is seen, almost without exception, as scrub or copse, in which state vast tracts of it are to be met with in the wide region of its habitat. I have not the smallest doubt that the spray of this tree has furnished the Quercus humilis of the older botanists, whose works have, until quite recently, furnished the materials for the compilations called the Natural History of Spain. The foliage differs considerably in size and colour, as usual in copse, and this is another reason for its figuring under different names. It is a very beautiful deciduous tree, and when in health is second to none of the European species in appearance, and I have no doubt is hardy enough for our climate. The foliage is a dark shining green, the leaves of a sort of oval shape, and serrated; they vary in size from one inch in length, or less, to four inches; so much so, that only a great deal of practice would enable any one to avoid confounding and splitting it into species. I suppose from the locality this is the tree figured by Boissier, as Q. Alpestris, which absurd name he proposed to confer on it, but the Quercus Quexigo would be far more appropriate, and his plate does not much resemble this tree, although he calls it Quexigo. The timber of the Quexigo is of good quality, but as they never grow together, there are no means of comparing its absolute value with that of the Q. robur. The bark of the large trees is corrugated much in the same way as that of the Encina. The elevation of the zone the two species inhabit is exactly similar, but I have not seen the Quexigo so low to the south as the congener, and I am not aware that it is found below the centre of the Sierra Morena, and the Serrania de Ronda. The medium height at which it is generally seen is from 2000 to 3000 feet above the level of the sea, although both in the mountains of Leon, and in the Serrania de Ronda, it attains a greater elevation. Wherever they are seen in juxtaposition, as in the Serrania de Guadalupe, and also in the Leon district, the species that is placed immediately above it is the Alvar, or Quercus tosa, mentioned in my former work as forming a zone in the Guadarrama and S. Nevada. This is the woolly-leaved species so common in the Landes, and at the foot of the Pyrenees, and I believe also in the Boccage of La Vendee, the most northern habitat that I can quote belonging to it."

At Jaen Captain Widdrington found in the markets "a round Pear, not to be distinguished in appearance from an Apple, of extremely good flavour." What can this be?

The following account of the bees of Estremadura is interesting. The case of the hiveless bees is new and curious:—"Bees abound in this district, and increase to such an extent that they return an enormous profit to those who take the trouble of looking after them. The common hive is the hollow stem of the Cork-tree, which is cut in lengths and is perhaps the best material in the world for the purpose; next to it is the common straw one used in England; both these substances have the same valuable quality of being non-conductors of heat and cold. They had never heard of such a thing, much less practised it, as killing bees, and were surprised when I mentioned such a custom. I ascertained a very curious fact in their economy that is well worth attending to. A gentleman was mentioned in my former work as living near Cazalla, whom I visited in his cortijo there, where he was farming the property he had purchased with his own fortune, from the Carthusian convent of Cazalla, and which had been restored to it, without a farthing being reimbursed, by the orders consequent on the invasion of 1823. This is the Canon Cepero, so well known in the first Cortes at Cadiz, of which he was one of the most eloquent and distinguished members. After the death of Ferdinand he recovered his property, resuming his station as canon of Seville, and was living in the house of Murillo, where I paid him a visit. He told me that being shut up in the convent of the Cartuxa at Seville, by order of Ferdinand after his return in 1814, a lot he shared with nearly all who had distinguished themselves in preserving the throne during the war of independence; by way of passing the time he applied himself to study the economy of bees, which he had followed up at Cazalla, and was so successful in his management that in a very short time he had a thousand hives! When the civil war commenced circumstances caused their being neglected and dispersed, and some swarms, finding no holes or cavities to suit them, attached themselves to a beam in an out-house, where they made their combs in a similar manner to that by which the tree wasps suspend their curious fabric from the branches. They were so well satisfied with this novel situation that they never left it nor swarmed, but kept adding successive combs, until they nearly reached the ground, and hung from the point of suspension like a huge living and waxen stalactite. The owner never disturbed them, but had the lower combs cut off as they were wanted, and the colony had now remained for a considerable period, without their showing the least disposition to change it. This is certainly rather important information for the managers of apiaries, and may serve to confirm the statements lately published on the practicability of inducing the insect to work downwards."

Garden Memoranda.

Messrs. Youell & Co., Yarmouth.—The conveyance from Norwich to Yarmouth by the railroad forms a very agreeable ride; the country being level, a passenger enjoys a sight of the surrounding scenery without interruption during his transit, from the "Ancient City" to the mouth of the Yare. In a recent visit to the former place, I was induced by this easy mode of conveyance to visit the establishment of the Messrs. Youell, to see their extensive collection of Carnations and Picotees. The stage alone is furnished with more than 700 pots, and double this quantity forms a reserve, which enables them to fill up the vacancies as they occur, by which the Exhibition is kept in good condition for a considerabl

time. The stage on which these flowers are arranged would probably be more effective if divided into two; for in arranging so large a quantity for general effect, it is difficult to give the due preponderance to colour, without a much larger proportion of flakes and bizarres, compared to the number of Picotees. This assortment, like all good collections, is composed of the standard varieties, which have stood the test of years; with the fine sorts more recently introduced. In their growth the stems are rather short, but the flowers are full-sized and good in colour; the flakes are particularly fine; the bizarres partake of the fault of the season, that of being rather pouncy in the white. It is through this establishment that the Picotees raised by the Rev. I. Burroughes, an enthusiastic and successful cultivator of this favourite flower, find their way to the public. I noticed a new variety raised by this gentleman, named the Duke of Newcastle, a flower of first-rate properties; it is a light-edged purple; the petals are large and of good form and substance, even on the edge; the colour unbroken, the pod good, and with less disposition to bar than is common. Another new flower, named Mrs. Benyon, from the same source, apparently a fine variety, not sufficiently open to form a correct opinion of, and a new variety named Cook's Unique, red edge, with large stout petals and good crown, are two fine flowers which will soon find their stations in general collections. The Fuchsias here are numerous and well-grown. To a collection of the finest sorts in general cultivation, are added many seedlings of great merit of Messrs. Y.'s own raising, and from seedlings of the present year, three have been selected, which are handsome and distinct varieties—named Laconii, Elegans, and Elisha; the last-mentioned variety has a very faint pink tube, sepals tipped with green, corolla deep blood-colour, and the flowers are a good size. Among the seedling Verbenas, a few distinct varieties have appeared—one named Leonora, a rich lilac purple, with a light eye, is a very bright and beautiful flower; Rose charmante, a brilliant rosy pink of a peculiar tint; British Queen, a large handsome lilac; and Hebe, a delicate grey; Vulcan, which is a very distinct flower, has the fault of curling back, and will, on this account, be less effective. In the grounds I noticed a very extensive collection of Araucaria imbricata, in fine health and condition; Abies Deodara, and young plants of Pinus gerardiana and excelsa. This memorandum was made from the town garden—the nursery is some distance from Yarmouth.—*F. H.*

Miscellaneous.

An Easy Way of Making the Seeds of the Cedar of Lebanon Germinate.—M. Leroy (André), a nurseryman at Algiers, employs a much more simple and natural method of raising Cedar seeds than the common one. Instead of extracting the seeds from the cones, he plants these last entire in the soil; the seeds find in this condition a moisture suitable for their germination; they unfold themselves between the scales, of which many perish of themselves. It is easy then to remove them, for after-transplantation, either into beds, into the open ground, or into pots. This way is convenient for gardeners who are engaged in the multiplication of such trees; for it comes nearest to nature, and all the fertile seeds germinate. M. Pépin has presented to the Royal Society of Agriculture some seeds of a Cedar of Lebanon, gathered from a single tree, planted in the Garden of Plants in 1735, by Bernard de Jussieu. These seeds germinated last winter in their cones, while still attached to the tree; from the end of January every gale of wind blew down several. This premature germination was doubtless owing to the mildness and dampness of the winter. This was the first time that M. Pépin remarked this fact. The greatest part of the seeds were very much swelled, others had their radicle already extended, to the length of one or two inches. The winged membrane which accompanied the seed was generally adherent. Many hundreds of those seeds collected on the ground, have been sown in February, and are in as perfect a state of vegetation as those which have been since put into the ground.—*Revue Horticole.*

Cider; the Antiquity of its Use in Normandy.—The use of the fermented juice of Apples and Pears was known in the sixth century, and perhaps before, because since 587 St. Radegonde, Queen of France, drank perry (*piratium*) daily. The cultivation of the Apple and Pear tree must have been followed in Gaul, under the government of the Romans, who, as we know, took great interest in this cultivation. As to the art of extracting a fermented liquor from these two fruits, the exact time of its antiquity cannot be fixed, but it is at least certain that it was known to the Gauls and afterwards to the Franks, long before the arrival of the Normans. Indeed, in the eighth century, in the famous Capitulary of Villis, which repeats the views of Charlemagne upon the finances and administration of his dominions, is found a curious list of the different trades which he thought necessary to be in each of his great estates. This illustrious Prince ordered that they should contain persons who were able to brew beer and beverages made with Apples, Pears, and other fruits. Other records of the same period frequently mention the use of cider; and at the time of the fourth irruption of the men of the North, into Neustria, in 862, some authorities not less respectable speak of the alleys of Apple-trees which surrounded the ancient abbey of Fontenelle or Saint Wandrille, which these conquerors entirely destroyed. Hugues de Gournay, in the charter of the foundation of Clair Ruissel, gives to the monastery a right to one of his Apple orchards. We also see, in a record of 1183, that the Monks of Jumiéges received a donation in Apples, sufficient to make enough cider for their consumption. There are numbers of charters as ancient, in which one of the principal duties that the monarch requires of his vassals is to gather his Apples to make his cider. I am indebted to M. Deville, the director of the Museum of Antiquities at Rouen, for the knowledge of a curious document respecting this subject. It relates a passage of a poem, written by the chaplain of Philip Augustus, William Lebreton, who had followed this Prince at the conquest of Normandy, in 1203—1204. This is what he says—

"Non tot in autumni rubet Algia tempore pomis
Unde liquare solet siceram sibi Neustria gratam;"

Algia is the province of Auge, and from *sicera*, an ancient Latin word, which signified all fermented liquors except wine, is derived our word *cidre*, which was then written *sidre*. Noel found that cider was among the goods which went up the Seine in 1315, and that in 1407 it was sold in Paris by wine-merchants. It appears very clear to me that we are not indebted either to the people of Navarre, Biscay, or to the Northmans, for introducing the cultivation of the Apple-tree into France, and for the art of brewing Apples. But I think it is equally certain that it was only towards the end of the 13th or 14th century that the use of cider became general in Normandy. Before that period beer, then known under the name of *cervoise*, was the common drink, even in those provinces which at the present time produce the most Apples. Many facts prove it. In towns and country villages there were brewhouses, some of which are known to have been very ancient, one of which was at Lillebonne. In 1358 there were brewhouses at Rouen. The acts of Dieppe mention beer, in speaking of the liquors which the fishermen took out with them to sea; and we know, besides, that there were very few religious houses which had not mash-tubs, boilers, and other utensils necessary for brewing this liquor. If, as we doubt not, Normandy possessed great numbers of vineyards before and during the middle ages, beer, and afterwards cider, counterbalanced at a very early period the use of wine, which has never been in our country anything more than a very indifferent drink. The cessation of the cultivation of the Vine has in my opinion been caused by the disforesting of our country, for the old and lofty forests protected the sides of the hills planted with Vines from the north winds, and consequently assisted in ripening the Grapes. In proportion as the forests of Normandy, which formed an extensive net-work, were felled, the quantity and quality of the wine decreasing every year, the inhabitants had recourse to other liquors, the preparation of which depended less upon the inclemency of the weather.—*Comptes Rendus.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

After the middle of August—in dull weather—established stove plants should not be watered late in the afternoon; the dryer the stove is kept at night through the autumn the better the plants will ripen their wood; and we all know that on the perfect maturity of each season's growth depend in a great measure the success of flowering and fruiting exotic plants: therefore allow the plants as much room as possible for the next three months. This cannot be too much insisted upon. An early vinery, where the leaves are all fallen, would be a good place into which to remove some of the stronger specimens from the stove for six weeks or so: here, with dry atmosphere, and plenty of air and light, they would ripen their wood perfectly, and the Vines would not be injured by the treatment.

Conservatory.—Those with fixed roots and narrow pits attached outside for planting stove-climbers in, for furnishing the rafters, are now coming generally into use, and the experience of a few years will suggest further improvements in this way. "Devonian's" experience this season (p. 504) has proved what I have long asserted, that none of the hardy climbers should be allowed to run into the upper portion of a house having a fixed roof. Even the Mandevilla, which flowers equally well in the stove and in the open air against a conservatory wall, will succeed better in the lower part of such a house. There can be no question about the next best climber to suit "Devonian's" house without the aid of a stove pit: it is the Stephanotus floribundus. A plant of this that has not been more than eighteen months planted out in the conservatory here, is now a complete mass of bloom from top to bottom, and growing away as freely as a Passionflower which is against the next pilaster. Echites suberecta was planted last spring, and it promises to rival the Stephanotus. I mention these things in order to keep people from planting out such climbers in a conservatory from this time till next April. A great step in furtherance of this mode of applying tender climbers would be to procure old plants, and train them on the rafters of a stove or vinery one season before they are removed to the borders of the conservatory; but where there is a pit at the back of the conservatory to receive them this precaution is not necessary.

Greenhouse and Pits.—Many of the more tender Heaths suffer much from wet autumns, and nurserymen turn these into pits or greenhouses about this time. Pits are by far the best places for such plants, as the glass can be put off and on as circumstances may require. Chrysanthemums and Violets must be well attended to from this time; give abundance of liquid manure to both, now that they are strong enough to make use of rich food. A plant or two of the Cactus truncatus might be put into the Gardenia frame, or into an empty Melon pit, with other plants requiring heat: they would flower sooner than the general stock, and a few of them might be kept back for succession.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

In addition to a proper preparation of the soil of flower-beds, it will also in another season be advisable to place more reliance upon Annuals for an early spring display; and consequently, a proper preparation must be made by sowing a general collection of the best kinds towards the middle of September. In the spring, I recommended the planting of beds thicker than usual: and accordingly, instead of allowing one plant to every square foot, as was the rule in former years, I planted two. The result, considering the season, has been satisfactory, my beds having been filled and in full bloom for the last six weeks; but then this has been attained by an expenditure of labour which not one gardener in fifty could command; and therefore, though the beds are full, there is no particular credit in the matter, as in ordinary seasons I have seen them quite as well stocked by the middle of June, and without using near so many plants. Now, in the coming season, I intend to plant three plants on every square foot; and instead of propagating and keeping the plants in the usual way, in stock pots, I intend to strike three plants in a large 60, filling the pot half full of soil in the first outset, and then earthing the plants up as they advance in growth; thus our plants will be all autumn-potted; and though they may require more room for the winter, turf-pits are readily built, and, with proper attention, they preserve plants as well as can be desired. No amount of labour, however judiciously directed in the spring, can make up for time lost in the preparation of plants in the autumn. Those who have the best plants in November will have the best show of flowers next June.

Reserve-Garden.—Sow ten-week stocks immediately, under the protection of a hand glass. Do not permit the young plants to become wet, or they will damp off. They are liable to mildew, but sulphur will check it.

Pits and Frames.—Proceed with the propagation of all bedding-out plants as expeditiously as possible, making choice of the more difficult ones first, such as Nierembergias, Lotuses, and the like. Leschenaultias for turning out next season should now be strong plants; give them another shift if they require it. Propagate scarlet, variegated, and common Pelargoniums as fast as you can get cuttings.—*W. P. A.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Let the plants swelling their fruit be looked over twice or three times a week when the weather is hot, that they may receive no check for want of water. Dew the leaves over on the afternoon of every fine day. Much judgment should be exercised in watering the large successions during the next three months, as many of the pots are by this time so full of roots, that, if as much water were given to them as the roots would absorb, the result would be, by the commencement of winter, large and overgrown plants, which, however, would produce fruit of a very disproportionate size, owing to the plant having expended so much of its strength in the formation of leaves. Those who have given their larger successions the final shift will do well to prevent this overgrowth, by withholding, to a certain extent, the usual supply of water. The same effect may be produced by giving more air; but this would also check the growth of other plants in the same pit, which may rather require to be encouraged. If a pit heated with dung can be spared for growing the crowns and suckers in, it will suit them much better than putting them with the other plants in the larger pits. Prepare it by filling it with Oak-leaves, or partly-spent bark; apply but slight linings at first, to avoid having an undue degree of bottom-heat. Plunge the pots about two-thirds of their depth in a layer of tan, and shade till they become rooted.

Vineries.—Use great caution now to prevent moisture in houses where fruit is ripening, as it causes some of the thin-skinned kinds, as Muscadines and Sweetwaters, to crack. No pot-plants which require watering or syringing should be kept in the vineries with ripening fruit. Now is a good time to repair and paint, or make any necessary alterations in the early vineries. Vines in pots, when their leaves begin to fade, should be removed to the north side of a wall, and the pots laid on their sides, that the roots may be kept dry; a little litter may be laid over the pots, which will be of service to the roots, by preserving them from sudden changes.

Peach Houses.—In the late houses (the crop being now over) the trees will require to be watered and syringed with regularity. The lights should be open as much as possible to admit of a free circulation of air. After the crop is gathered, I find nothing better for clearing the trees of thrip and red spider, than applying soap leys to them with the engine.

Figs.—In fine weather too much air cannot be given where fruit is ripening. Supply the roots with water when necessary. For this no rule can be laid down, as much depends on the trees being in a state of luxuriant growth or otherwise, or on their being confined by walls. Those, whose roots are confined by walls (if bearing freely) will require occasionally a good watering with liquid manure.

Melons.—In dull weather the Melon plants will grow very fast, and will require strict attention to stopping and thinning. Give plenty of air, it will improve the flavour of the fruit. Withhold water when the fruit is ripening: a sudden supply of water at that time often causes the fruit to crack and become worthless.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Vines will now require much attention where there is a prospect of ripening the fruit. The bunches should receive their final thinning, and unless in the case of small sorts no more than one bunch should be left on a shoot. Remove all superfluous wood, in order to throw as much strength as possible into the fruit. If the spur system of pruning is adopted, leave as many shoots besides those in fruit as will be wanted next season; shorten bearing shoots one joint beyond the bunch, or to the joint at the fruit, provided the leaf is preserved, and one joint of lateral allowed to remain. Pick out a few of the buds at the axils of the leaves, towards the points of these shoots, that the buds at their base may be rendered more plump for next season. If the long or succession rod system is followed no short shoots need be left that do not carry fruit, and these must be kept well shortened, so that by removing all useless growth and picking out the young buds in the axils of the leaves of such shoots, more strength and full exposure may be given to those long shoots you intend for bearing next year. Leaving a lateral with a leaf or two attached, has a tendency to strengthen the bud at its base, and prevents this bud bursting, if the shoot should be rather prematurely shortened; but some successful gardeners object altogether to the leaving of such laterals, considering that they render the buds three-cornered instead of plump and round. *Grafts* should now have their bandages loosened, and their shoots properly secured from winds.

Mildew.—See that it does not make its appearance on your wall trees. As a temporary remedy, nothing is preferable to flowers of sulphur. If merely the points of shoots become affected, cut them off at once. Some trees from their tender nature are very liable to its attacks, but in their case its ravages may be much modified, if not altogether removed, by paying attention to keeping the root and top of the tree in an equal state as respects temperature and moisture. Much knowledge may be gained respecting this troublesome enemy, by watching the circumstances in which it attacks the more common vegetables, as Peas, &c. *Onions.*—The remains of the autumn-sown Onions should now be got out of the ground as soon as possible. The same may be said of Shallots, Garlic, &c., as soon as their leaves decay. Spring-sown Onions may have their tops gently bent down with the head of a rake, to cause the bulbs to swell better. The sowing of seed to stand the winter, should proceed without delay upon cold stiff soils; on light soils, and warm situations, it will do a fortnight hence. No sorts are better than the Strasburgh, or large White Spanish. *Celery.*—Prepare for earthing up the first general supply by removing all suckers and tying the plants neatly up. I earth up my first crops all at once, from three weeks to a month before it is wanted. If earthed up at different times at this early season, many of the heads will run. We have had some for occasional use for more than a month. *Routine.*—Gather Herbs for drying. Plant out and hoe among winter crops. Clear Strawberry beds; make fresh plantations. Sweep and roll the walks, and render the kitchen-garden as much an object of interest as the pleasure-ground.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Put in practice the directions given in late Nos.

Coppice.—Attend to directions previously given for summer management in this department.

Young Plantations.—It is of great importance to keep the young plants and trees clear of all other stuff, cutting in, everything that overgrows or presses on them, or that may injure their young and tender shoots. When too much shaded, young trees grow up tall and sleader, and without a sufficient number

of side-branches. Remove or "shorten in" any very strong branches near the top that are likely to become rivals to the leader, or produce forks in the main stem; also "shorten in" any of the strongest side branches, particularly where they are scanty, in order to increase the number of healthy shoots and leaves, for on this depends the increase of timber in the trunk.

Hedge-rows.—After boisterous winds the newly-planted trees should be examined, to see if they are firm at the root, and free from wind-waving.

Nursery Work.—The young plants will now be growing very fast; keep down weeds; train the young growing shoots of the present season in the proper direction.—*W. B.*

VII.—COTTAGERS' GARDENS.

As wasps are exceedingly numerous this season, protect by every possible means any fruit that is now approaching maturity. Among Plums, some recommend suspending bottles half filled with sour beer, honey and water, or any clammy liquid that will answer the purpose of entrapping them; and in favourable situations, where a Peach or Nectarine tree is cultivated, the fruit should be covered very thinly with wadding, as soon as there is the least appearance of any of them being injured. This, however, seldom happens before the fruit has attained its usual size and begun to colour. Collect any of the early sorts of Apples and Pears that are blown down, and lay them carefully aside on a dry floor or shelf. Let those that are bruised the most be placed by themselves and first taken for use. Continue to remove summer crops and prepare the ground for other vegetables. Those who are fond of Spinach may now sow a small quantity for autumn use. Where Parsley is much wanted and the spring-sown crop has either failed or is considered insufficient for a winter supply, an edging may be formed of the best curled sort, which will probably succeed better now than that sown in spring. The last sowing of Turnips for the season should also now be made, and a quantity of Vanack Cabbage may still be planted. This sort makes excellent spring Coleworts, and pushes fine sprouts from the stumps after it is cut. The last planting of Cauliflower and Broccoli had better now be got in. Tomatoes, if any, should be kept thin; cut out all useless shoots, and stop those retained at the first joint above the fruit. Keep Dahlias neatly tied up in order to prevent them from being broken by high winds, which are likely to prevail at this season. Trap Earwigs by placing inverted pots, having a little dry Moss in them, over the tops of the Dahlia stakes. In this way, by examining the pots frequently and killing the insects collected, these troublesome vermin may soon be got rid of. Stir up the surface of the ground among growing crops, and destroy weeds wherever they appear.—*J. M'H.*

State of the Weather near London for the week ending Aug. 2, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Asparagus.—*A.*—The ground for the reception of your seedling Asparagus should be prepared before the plants begin to push in spring. It should be trenched 2½ feet deep, with at least 6 inches of rotten dung, or if the latter can be afforded a foot thick, so much the better. The ground should be trenched twice over, in order that the dung and soil may be thoroughly mixed. Plant in March, when the ground is in good working order, and rather dry than wet, in beds 4 feet wide, with 2 feet alleys between the beds. There should be three rows in each bed, the first a foot from the side, then a foot between each of the rows, will leave the third row likewise a foot from the other side of the bed; the plants may be a foot asunder in the rows, and covered over the crowns with fine soil, to the depth of about 2 inches. Some cultivators, French as well as English, prefer midsummer planting.‖

Bees.—*Undecided.*—You may introduce a little smoke from Tobacco, rag, &c. in the way you mention into the top hive. If that fail to dislodge the bees, you had better take off the hive, and fumigate them with puff ball, without disturbing those in the lower hive. Then put the apparently lifeless bees into an empty hive, and put it upon the top of the box; the bees will soon join those below. Except fumigation is often repeated, bees are not injured by it. *J. Wighton.*

Books.—*R. R.*—"Mills on the Cucumber." Sulphur is the only known *remedy* for red spider. A proper supply of moisture is the *preventive.*——*M. R.*—The first Latin grammar you can buy for 6*d.* on a book-stall, is as likely as any to answer your purpose. And add to it a Latin New Testament, which you can study by comparing it with an English one.——*A Constant Reader.*—Prof. Lindley has given up the idea of publishing a 2nd volume of his "Synopsis," now that the 5th volume of Smith's "British Flora" has appeared, with all the Cryptogamic plants fully treated of in it.

Cucumbers.—*Rus.*—A fruit 18 inches long, from the open border, without bottom-heat, and a handsome fruit too, is a remarkable specimen of good growth. Would it have happened in a season less hot than this?

Forest-trees.—*G.*—The following are quick growing, and will succeed, in an exposed situation: Quercus rubra, Turkey Oak, Ulmus vegeta, Alnus cordifolia, Acer pseudo platanus, Populus monilifera, Juglans nigra, Salix Russelliana and alba, Tilia europæa, and Sweet Chesnut.¶

Fruit-trees.—*C. G.*—*Cherries* for an orchard may consist chiefly of the following varieties:—Bigarreau, Bigarreau Napoléon, Büttner's Black Heart, Werder's Early Heart, Elton, Downton, Flemish, Florence, Knight's Early Black, May Duke, Morello. *Plums* for an orchard:—Royale Hâtive, Green Gage, Purple Gage, Coe's Golden Drop, Kirke's, Fotheringham, Washington, Ickworth, Imperatrice, Nectarine, Blue Perdrigon, Shropshire Damson, White Magnum Bonum, Early Orleans.‖

Fuchsias.—*T. J.*—It is very true that *F.* cylindrica has unisexual flowers; but our answer referred to the common species. We have never heard of a hybrid with that species, nor can we see what good is to be expected by crossing so poor a thing. It is very improbable that a Digitalis should be fertilised by a Gloxinia or a Lophospermum; but the latter is far more likely than the former. If you can throw a decided violet into the petticoats of the self varieties of Fuchsia, you will render beautiful what are now much less attractive than they were expected to be. Self Fuchsias will be driven out of cultivation.

Grafting.—*A Reader.*—You must be a good operator to make one-year-old Beech-cuttings take, as we see that you do. But although you may have succeeded, and although others also succeed sometimes by using such wood, depend upon it two-year-old wood is what it is safest to employ. Ask the nurserymen.

Heating.—*No.* 2.—Dion is an idle fellow, and says that he will do no more than he has done:—"The idea is all that I proposed to give; others must use their heads and apply it. Any clever workman will understand the mode of executing such a plan." We confess we see no difficulty in setting in brickwork such apparatus as he proposes, and in making a chimney to carry off the smoke, or in applying fuel. There is no sort of necessity to keep the water always boiling. Once heated it will retain its heat for a long time. If not set in brickwork there would be a great loss of heat; but the brickwork might be very slight.——*F. E. S.*—The apparatus will work, no doubt. You had better construct a close iron box for the fire-place; make on one side a door for draught, and by which ashes can be raked out, and from the other carry a small pipe into the open air. In such a contrivance you may burn charcoal or good coke, without inconvenience. In raking out the ashes pour water on them, and they will not be troublesome because of their dust. Gas-stoves do not suit plants—at least we should fear not; they would contaminate the air too much. You may no doubt keep your boiler in action by a Camphine or other spirit lamp, but it would be an expensive process. If expense is no object, that would be the best way of heating the boiler.

Horticultural Society.—*D. A.*—We will lay your letter before the Exhibition Committee. We do not see how holding a meeting on a Saturday is breaking the *Christian* Sabbath.

Horticultural Society of Paris.—*M.*—Upon a full consideration of the question, we have resolved not to admit any discussion concerning the Royal Society of Horticulture. French disputes must be settled in French journals. We have no means of judging what truth there is in your statement that "the prizes are never given to *things* but to *persons*;" and if we admit letters on one side we must on the other. If matters are conducted as you represent, why do not the members of the Société Royale de Horticulture take the course that would be followed in England, viz., join in removing the present managers, and in introducing others in whom they have more confidence?

Hydrangeas.—*Corylus.*—In the Index for 1843 are references to the paragraphs respecting the turning these plants blue.

Insects.—*J. Fox.*—The aphides infesting your Lettuce-roots, are the Eriosoma lactucæ of Curtis. I have often seen them attacking the plants in July, but generally in neglected ground. Mixing unslaked lime with the soil in the seed-beds, and trenching the land in winter, would probably eradicate the disease. *R.*——*A Constant Reader in the North.*—The scales infesting your Vines appear to be the Coccus vitis. Clear away the old leaves as they fall in the autumn, and in February or March you must strip off the old bark and burn it directly. When this has been judiciously done I have seen the most beneficial results; indeed the Vine-scale has been completely eradicated. *R.*——*L. T.*—If your Melon-leaves are spotted by insects, it is at an earlier period of the year, for we can find none on them now. From their appearance we should attribute the disease to damp. *R.*——*London.*—As we could find no insects upon your Melon-leaves, owing to their not being inclosed in a box, it is impossible to say whether they are injured by the Thrips or Aphides. The former cannot be extirpated, it is said, from their being able to bear a very high temperature; but fumigation with Tobacco will destroy the latter. *R.*——*E. Q.*—The insects you complain of are Chelifers, and are useful in destroying the Acari which infest frames. I wish, therefore, you would observe their habits minutely, and report upon the subject. *R.*——*N. O. P.*—We are much obliged for the larva; but it is totally different from the former one, and feeds upon Aphides. *R.*——*W. C. T.*—Your beautiful Fir-galls are figured in the 3d Vol. of this Journal, p. 630, and at p. 661 are some farther observations. There are both apterous and winged specimens, and some pupæ, but they are all the Chermes abietis of Linnæus. *R.*——*F. H. S.*—The insects destroying your Beans are an Aphis; but surely it is not the same species which infests your Dahlias. The best means of getting rid of them is to nip off the heads or leaves which are most infested, and destroy them at once; then syringe the plants with tobacco-water, or you may dip the shoots into the liquor, when it is very warm. The Ticks are called Ixodes Ricinus, and will attack man as well as animals. *R.*

Local Horticultural Societies.—*Arbrouth.*—We shall be happy to prepare the printed forms we suggested, if we find any disposition to use them. At present, however, yours is the only application for them.——*C. M. C. H. S.*—As your observations were general, not personal, and made to serve the best interests of such societies, it is discreditable to the individuals you mention that they should have regarded your communication as offensive. This shows that your statement was correct, and that the judges in whom the ill feeling has arisen are unfit to hold their offices. Since you ask our opinion, we have no objection to say—1. That it is disgraceful in any man to judge his own productions, and suicidal in a society to permit him to do so; 2. That good feeling ought to prevent all communication between the judges and exhibitors, until after the Prizes are declared; and that if this is not attended to, nobody will believe the decision of the judges to be impartial. The last question we cannot answer; nor is it necessary that we should do so, because it is quite clear that if any society is managed in the way you describe, that society must go to the dogs.——*J. L. Dartmouth.*—You have not been named as the person complained of, and we cannot enter into local disputes, which must be settled on the spot. Our correspondent's letter was intended to show one of the causes of the failure of local Horticultural Societies, and his criticism was directed against the Society rather than any exhibitor. Even if we were disposed to publish your letter, its improper language would prevent us. If you are the person meant, and the plants were your own growth, you should satisfy the committee on that point—not us.

Mildew.—If *A Constant Subscriber* will tell us what he means by mildew in a hothouse, we will endeavour to suggest a remedy. If his leaves are mildewed, he had better send some by post.

Mulberry-trees.—*M.*—Pray get us the full particulars; we shall be much obliged. They should include, 1, the diameter of the head of the tree; 2, that of the earth heaped up; 3, that of the space built round the tree; 4, the nature of the soil.

Names of Fruits.—*A. P.*—Your Pear No. 71, is not the French Jargonelle; it is the Summer Portugal. No. 35 appears to be the Old Colmar, as far as can be judged from wood and leaves, in the absence of fruit. The Apple No 80, is the Kerry Pippin.‖——*J. F.*—Your Cherry appears to be the White Heart.‖

Names of Plants.—*H. Regius.*—Drimia lanceæfolia, not lanceolata.——*J. B.*—The plant which has so much excited your surprise is the common state of New Holland Acacias in their youth. The greater part of them produce common Mimosa leaves at first, and then exchange them by degrees for simple leaves, which eventually become their only foliage. What species you may have seen we cannot say; perhaps A. melanoxylon.——*W. F. G. F.*—Catasetum tridentatum.——*R. B. B.*—Sambucus racemosa.——*A. B.*—That variety of the common Ash which is called F. heterophylla.——*Inquiry.*—Ipomœa sanguinea. There are two plants in the gardens, called Dendr. revolutum; yours is one of them; but whether they are species or only varieties we have not just now the means of deciding.——*J. C. L.*—1. Epidendrum inversum; 2. *E.* squalidum. We do not know a white Acropera.——*J. W.*—1, 2. Asplenium adiantum nigrum; 3. Asperula cynanchica.——*Pan.*—Chenopodium Bonus Henricus—perennial; a bad sort of Spinach.——*C. R. D.*—Crassula obliqua.——*A Subscriber.*—No. 1, Blechnum orientale; 2, Pteris, or Doryopteris pedata; 3, Doodia aspera; 4, Davallia elegans; 5, Pteris tremula; 6, Aspidium, or Polystichum coriaceum; 7, Platycerium, or Acrostichum alcicorne; 8, Doodia caudata; 9, Rondeletia speciosa.§——*T. O. M.*—Masdevallia infracta. The determination of Exotic Compositæ is so difficult, that we really cannot undertake it.——*Henry Winch.*—Cycnoches pentadactylon.——*X. Y. Z.*—Hypericum Elodes.

Peach-trees.—*H. C.*—Your plants are attacked by red spider, for which you have no remedy except continual syringing. If the fruit was not so near ripeness a dusting of sulphur would drive off your enemy. All you can now do is to wait till the fruit is gathered, and then apply sulphur. The dry, hot weather has been the cause of the evil. It is to be presumed that your Morello Cherries have their roots in undrained soil. If so, your obvious remedy is to plant them so high that the roots cannot reach it—unless you can drain the soil better.

Plants for Bedding-out.—*Isle of Wight.*—Procure the following, and increase them this autumn. Either of these will do for the centre, viz.:—Scarlet Pelargoniums, Fuchsias, or Pentstemon gentianoides coccineus. For the smaller beds take Petunia superba, Beauty, or splendens; Gaillardia picta, Œnothera Drummondii, Verbena atrosanguinea, Bishopii, Taglionii, Queen, and Lobelia azurea. These will all flower during the summer and autumn.¶

Trees, &c.—*Delta.*—If Delta be not a gardener by trade she cannot legally remove the trees or bushes mentioned by her. *W.*

Miscellaneous.—*A Lady.*—There is no better plan of destroying green-fly on Pelargoniums in a greenhouse than that of smoking the plants with Tobacco. Oleanders and Camellias are the best plants for a large Elizabethan hall, where there is a great draught in summer, and but little sun; but they will not flower under such circumstances. There is no evergreen creeper so good as Ivy for concealing a rustic bridge. For plants for bedding out in the flower-garden, see above. Besides Oaks, Heath or Thrift form a good border edging. In raising young Oaks the Acorns are sown either in autumn or spring. The cause of your Strawberries, which have been very prolific, drying up, and not ripening their fruit properly, is no doubt owing to the dryness of the season.‡——*J. Power.*—It is a bad practice to mow the leaves off your Strawberries. See p. 755, vol. for 1843.‡——*M. A. G.*—Cuttings of the new sorts of Calceolarias will strike quicker if you give them a little bottom-heat, but they will also do without it.‡——*A Kentish Man.*—Manor Farm, Deptford.——*Dot.*—A Wisteria sinensis, a small Tecoma radicans, and a small Laurestinus will not bear moving now. It is supposed that the ants feed upon the sugar secreted by the aphides, and the motions you have seen may well be supposed to be connected with that operation. There is nothing surprising in your hybrid Cactus having formed a stem 3 feet 6 inches high in six years, or in its flowering in a sitting-room. It, however, shows that you are a good and kind nurse, or it would not reward you with bloom 16 inches in circumference and 4½ inches in depth.——*W. A. L.*—If you can lay your pond dry, why not pull the Water-Lilies out of the mud? We cannot recommend you to salt (!) them. What is to become of the salt when the pond is again filled with water?——*L. B. M.*—All glaziers can supply glass. We never recommend tradesmen, for obvious reasons.——*J. B. W.*—It is very doubtful whether your seeds are worth sowing.—*J. H. H.*—We regret to say that your very careful description does not enable us to recognise the plant to which you allude. The points to which you attended are not such as botanists can use for the purpose of distinguishing plants. If you could give us *one* blossom, however shrivelled and old, we should probably tell you what your plant is. Your description shows that it was no Vitis; and that being the case the plant has little interest.——*W. D.*—Allow your young Fuchsias to remain in small pots through the winter. In spring, when they begin to grow, shift them into pots of a larger size, and encourage them as much as possible to form good plants early in the season.‡——*C. H. Hungerford.*—Ceropegia elegans is a well-known plant, and may be procured from any respectable nurseryman.‡——*J. N. Q.*—You had better plant against your wall, riders alternately with dwarfs; the former to be removed as soon as the latter become large enough to take their places.‡——*R. D.* not received.

SEEDLING FLOWERS.

Achimenes.—*J. C.*—Your Seedlings are pretty; but they bear too much resemblance to Rosea and the Old Coccinea. We can discover no trace of Longiflora in them.‡

Calceolarias.—*J. B.*—Your seedling is a fine bold flower; ground a rich yellow, with large blotches in the centre, and having a margin of smaller spots around the outline; good form.*

Fuchsias.—*Y. and Co.*—No. 2 is a large, bright, showy flower; tube and sepals carmine, corolla large, with a tinge of violet, foot-stalks very long. 3—Tube and sepals rosy pink; the latter are very long and narrow, and curl up in a peculiar manner, which is not agreeable; corolla long, of a rosy vermilion.*——*J. T.*—*No.* 1.—The sepals and corolla of this variety are too much alike in colour, and the latter want substance. 4, 5, 6, are three flowers of the same character, and too small; they are also not new—similar varieties are in cultivation. 14 has a bad corolla; 2 and 7 are too much alike, and possess no novelty; and 3, which is the largest and most showy in the collection, has too faded an appearance in the sepals.*——*J. B.*—The three dark varieties 4, 6, 7, possess no novelty; the difference between the colour of the corolla and the rest of the flower is so trifling, that their appearance is dull, compared with many of the fine sorts that are now generally cultivated. 6 is the best, being a stout, well-formed flower, but there is a deficiency of the violet colour in its corolla. 1, 2, and 3 are specimens of an opposite character; the tubes and sepals are of the most delicate pink, approaching to white, with the latter tipped with green. 3 is the best in form; 1 is rather larger; these have rosy vermilion corollas; 2 is a smaller flower of the same character, with a tinge of violet in the corolla.*

Pansies.—*R. R., N. B.*—No. 2 is the better seedling; it is flat, and the eye well marked. In No. 1 the markings on the edges of the lip and side-petals appear too much like stains; they both want the substance of first-rate flowers.*

Pelargoniums.—*W. M.*—The Guernsey seedling is a promising flower; rich and fine in colour, with petals of good form and substance. We should like to see it again when in condition.*——*P. P.*—The form of your seedling is not good, and we have many of the same colour very superior to it.*——*De Jonghe.*—Your box was opened as soon as it arrived; but not a flower was left. The contents had been so much shaken by the journey that all the petals had fallen, except from *roseum erectum*, which is a small flower of good form and substance, pleasing in colour, but requiring a white centre to increase its vivacity.—Foster's Favourite, Sultana, Nymph, Pulchellum, Lord Chancellor and Nestor, Garth's Queen Philippa, Witch and Unit, Hodge's Oberon, Lyne's Duke of Cornwall, and Beck's Susanna.*

Verbenas.—*W. G.*—No. 1 rosy red; the flowers of this variety are small, and it is not novel in colour. 2, rosy purple, with large, light eye; a good flower, but not new. 3 is an excellent variety, but its place is already occupied by Amethystina.*

SEED-WHEAT.—Any one desirous of purchasing Seed for next year is invited to inspect the two varieties of Wheat, SHIRREFF'S HOPETOUN and MORTON'S RED-STRAW WHITE, 120 acres of which are now growing on WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE.

The present is the only season of the year when the value of any variety of Wheat as Seed can be ascertained by inspection; for, if the examination of a mere sample of the grain, which can be seen at any time, be nearly uninstructive as to its quality in the eye of the baker (see *Ag. Gazette*, No. 5), it is entirely so as to the productiveness or habit of growth of the variety to which it belongs. These points, which are of the highest importance in the eye of the Farmer, can be ascertained only by an examination of the growing plant when in full ear. Price, 8*s*. per bushel. JOHN MORTON, Whitfield, Thornbury.

The Agricultural Gazette.

SATURDAY, AUGUST 10, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Aug. 14 Agricultural Society of England.
WEDNESDAY, Aug. 14 } Meeting at Dublin of the Agricultural
THURSDAY, Aug. 15 } Imp. Soc. of Ireland.

WEDNESDAY, Aug. 21 Agricultural Society of England.
THURSDAY, Aug. 22 Agricultural Imp. Soc. of Ireland.
FARMERS' CLUBS.—Aug. 22 { Richmondshire. / Grove Ferry.

IT is a matter of no slight advantage attendant on the weekly publication of an Agricultural Journal, that the attention of its readers may thus be called to subjects of importance at the most fitting times. It is not meant that agricultural topics are of temporary interest only; the operations of husbandry, which, taken together, form the business of the farmer, each of them exert a special influence on the great result —the quantity of net produce, or the money income of the farm. And thus there is not a single question connected with the practice or the science of Agriculture, which can *at any time* fail to be of interest; but while the farmer may reasonably have an eye to the future, and to subjects which may hereafter require his notice, his first and best attention will probably and justly be devoted to the consideration of questions of present interest. Certainly, therefore, we cannot at present direct our readers to the consideration of a more important subject than the PROPER PERIOD FOR REAPING WHEAT.

It would appear, at first, that the farmer cannot be wrong in allowing his grain-crops to attain maturity —to become fully ripe; ancient practice, so far as it goes, would certainly justify him in doing so. This, however, is not always a good guide to go by.

If by the period of maturity the time be meant when a plant has acquired its greatest value as an article of food, certainly this stage in the growth of every kind of crop ought to be attained before it is harvested; it is, however, by no means certain that maturity in this sense is not attained by our Corn crops at an early period in the process of ripening. Indeed it may safely be asserted that grain has passed the period of perfection and has begun to lose its value before it has become dead ripe. In support of this the testimony of all Nature may be urged that strength and vigour progress with growth only up to a certain period.

General reasoning, however, of this kind could never have been so influential with any farmer as to induce him to alter so important and time-sanctioned a practice as that of leaving grain to ripen thoroughly. And, practically speaking, the question remained undisturbed, and we were vain enough to fancy that at least we knew when our Wheat was ready to harvest, till Mr. J. Hannam, of North Deighton, near Wetherby, Yorkshire, in the "Quarterly Journal of Agriculture" for June, 1841, boldly asserted that the practice of allowing Wheat to become fully ripe was an injurious one. This assertion was based on the details of a careful and elaborate experiment made during the previous year, 1840. In 1841, Mr. Hannam continued his investigations on a still more extensive scale, and the results thoroughly corroborated his former conclusions. In September, 1842, the details were published in the "Quarterly Journal of Agriculture," and the question was discussed at length, the conclusion being that *the best period for cutting Wheat is when it is raw*, i. e. *from* 10 *to* 14 *days before it becomes thoroughly ripe*.

This decision has been since confirmed by the testimony of both Science and Practice. Professor Johnston in his Lectures quotes Mr. H.'s results, and confirms them by argument. He also states in his "Elements" (p. 188, 3d Edition), as "the result of theory and experience," that "about a fortnight before full ripening is the proper time of cutting Corn—as the skin is then thinner, the grain fuller, the bushel heavier, and the yield of flour greater." Mr. Stephens in his excellent "Book of the Farm," corroborates Mr. H.'s position. Indeed both the English and American Agricultural press have supplied numberless cases in support of his facts and arguments. To these our limits will not allow us to refer; we may, however, as testimony of peculiar value, name, that amongst the authorities who support the practice Mr. Hannam advocates are several of our Farmers' Clubs; those, for instance, of Leominster, Stewponey, and Wetherby, have each passed resolutions in favour of the early cutting of Wheat. On Thursday of last week it was resolved by the Wetherby Club, that it is advisable to cut Wheat at from 7 to 14 days earlier *than is customary in the district*. This Club is in Mr. Hannam's immediate neighbourhood, and its testimony is therefore peculiarly valuable. Such, then, being the case, we cannot do better at this time than call the attention of our readers to the subject, and direct them for a full statement of the case to Mr. Hannam's papers in the "Quarterly Journal." To such of our readers as have not the means of referring to the back Numbers of that periodical, the following epitome of that gentleman's researches will not be uninteresting.

Mr. Hannam's first experiment was executed in 1840. Three samples were cut viz. respectively :—

No. I.	Green	cut . .	Aug. 4, 1840
II.	Raw	,, . .	Aug. 18.
III.	Ripe	,, . .	Sept. 1.

These were thrashed and carried to market, when the following prices were put upon them :—

No. I.	61*s*. per quarter.
II.	64*s*. ,,
III.	62*s*. ,,

In 1841, a more extensive experiment was instituted; 5 samples of half-a-rood each were cut, viz. :

No. I.	Very green . . .	Aug. 12.
II.	Green	Aug. 19.
III.	Raw	Aug. 26.
IV.	Raw	Aug. 30.
V.	Ripe	Sept. 9.

These samples were threshed, and the samples were as follow :—No. 5 (ripe) was "bold, but coarse;" Nos. 1 and 2 (green), "fine in the skin, but small;" and Nos. 3 and 4, "equal in boldness of grain to No. 5, and superior in clearness of skin," being "unexceptionable as a sample." This desiccation, or drying-in of Nos. 1 and 2 proved that it was taken too early. The whole of the samples were shown at the Annual Show of the Wetherby Agricultural Society, Sept. 22, 1841, when the superiority of the raw-cut grain was confirmed by the Judges, who awarded to it "an extra premium, with a high commendation of the sample No. 3, cut a fortnight before ripe."—*Yorkshire Gazette, Sept.* 25, 1841.

Having in one trial ascertained the value of the samples by market, and afterwards by the opinion of a public meeting, in order to leave no loophole for doubt, Mr. Hannam determined to test their qualities at the mill. The gross quantity of each was ground and dressed by Mr. John Hardcastle, of Wetherby; and from the results we compile the annexed tables :—

No.	Grain. Quantity	Grain. Weight.	Flour.	Pollard.	Bran.	Waste	Cut.
	bush.	st. lb.	st. lb.	st. lb.	st. lb.	lbs.	
III.	$3\frac{1}{2}$	15 10	12 6	0 12	2 1	5	Raw.
IV.	$3\frac{11}{16}$	16 6	12 3	1 3	2 5	9	Do.
V.	$3\frac{1}{16}$	14 13	10 11	1 9	2 5	2	Ripe.

Weight per Bushel of

No.	Grain.	Flour.	Pollard.	Bran.
	lbs.	lbs.	lbs.	lbs.
III.	$62\frac{6}{7}$	$49\frac{5}{7}$	$3\frac{3}{7}$	$8\frac{2}{7}$
IV.	$62\frac{22}{56}$	$46\frac{22}{56}$	$4\frac{35}{56}$	$8\frac{56}{56}$
V.	$59\frac{5}{7}$	$43\frac{1}{7}$	$6\frac{4}{7}$	$9\frac{3}{7}$

Weight per cent. of

No.	Grain.	Flour.	Pollard.	Bran.
	lbs.	lbs.	lbs.	lbs.
III.	100	$80\frac{40}{43}$	$5\frac{25}{43}$	$13\frac{21}{43}$
IV.	100	$77\frac{8}{77}$	$7\frac{15}{77}$	$14\frac{20}{77}$
V.	100	$72\frac{19}{20}$	$11\frac{23}{207}$	$15\frac{19}{20}$

"From this we see," says Mr. Hannam, "that the bushel of No. III. gives more flour than the bushel of No. V. by $6\frac{4}{7}$ lbs., showing a gain of $15\frac{1}{7}$ *per cent.* in weight of flour upon *equal measures* of grain."

Again, we find also that there is an advantage of "nearly 8 per cent. of flour in favour of No. III. *upon equal weights of Wheat.*"

The theory upon which Mr. Hannam explains these astonishing results is, that as the sugar in the green plant becomes changed into the starch of the Wheat, so if permitted to remain till fully ripe another change will take place, the starch becoming gradually converted into *woody fibre;* for it is a well known chemical fact, that sugar, starch, and fibre, are composed of the same constituent elements united in the same proportions, and are one and the same substance in various forms—in some such way as water, ice, and snow are different forms of one combination of oxygen and hydrogen.

This gradual change to woody fibre takes place in many vegetables as they ripen, and it is by taking this into account that we can explain the curious fact shown in the Tables that the ripe Wheat contains 50 *per cent. more* "*flinty* particles"—"pollard," or "sharps,"—than the "raw cut grain." Hence it is no wonder that the flour of the ripe should be less *free* in the grain.

Mr. Hannam also claims a "better quality of flour," for the raw cut grain, and quotes the analysis of Professor Johnston, to whom samples were sent, from which it appears (see Lectures, p. 734) that the

Raw Wheat contained 9·9 per cent. of gluten.
Ripe do. do. 9·6 " "

The other advantages claimed for cutting early, are a better quality and greater quantity of straw, a better chance of securing the crop, &c.

The quantity, *i. e.* the weight of straw must, it is evident, be increased, and it is equally true that its quality is improved owing to there being more soluble matter in the *fresh* than in the *dry* straw. In fact, the additional weight of straw is nearly all an additional weight of nutritive matter, starch, sugar, &c. which would when dead ripe have become fibre; and therefore it is of great consequence to the value of the straw either as an article of food or as a manure. We have not space to allude to the other indirect advantages which Mr. Hannam claims for early reaping Wheat, nor can we follow his arguments or facts so fully as we would wish on the points alluded to: if, however, we have been able to give our readers an idea of the case as it now stands, or to draw their attention to the further investigation of the subject, we shall have done them good service.

In conclusion, we give Mr. Hannam's estimate, based on his experiments of the money value of an acre of the same Wheat cut *raw* and *ripe*.

No. III.	Cut a fortnight before ripe .	£14	18	0
V.	Fully ripe	13	11	8

—*H.*

APPEARANCE OF THE CROPS.

COLLECTED BY E. J. LOWE, ESQ., OF HIGH FIELD HOUSE, LENTON, NOTTINGHAMSHIRE.

ON tracing the appearance of the crops over England, and part of Wales, I have attained the following general results, viz. :—Wheat is, without a single exception, an average; if it can be called better in one county than another I should say it must be so in Oxfordshire; from this shire I have had specimens of ears of Corn sent containing upwards of 80 grains in each head. Oats hardly appear in any county to have reached an average; it is very short on the straw, and the account of it from Northamptonshire is worse than anywhere else. Early sown Barley will be nearly an average, with the exception of Westmoreland, Northampton, and Wales, where it appears to be deficient. But owing to the long drought in every county many acres prepared for Barley were not sown at all; and, also owing to the same cause, many acres were sown in the middle of May and June, which have vegetated at twice, consequently the quality will be very inferior, as well as the yield remarkably bad. Hay is a worse crop than we have known it for some years, not being half an average in any part of England, except on irrigated lands. This crop has been a complete failure in Northumberland, Cumberland, Huntingdon, Hertfordshire, Gloucestershire, &c. Clover and Grass seeds seem to share the same fate with Hay, but perhaps not to such a great extent. Beans vary very much; they are bad in Lincolnshire, Rutlandshire, Northampton, and Surrey. Of Peas, the best reports are from Ruddington Grange, Nottinghamshire, and Castle Donnington, Leicestershire, where the plants are thick on the ground and well podded; they are very bad in Rutland and Kent. Potatoes seem to have suffered in most counties; indeed, from what remarks I have obtained, there cannot be nearly an average. Where the Potatoes are most grown they appear the worst, from dry-rot. The accounts from Westmoreland, Lancashire, Staffordshire, Worcestershire, Wales, and Shropshire make them a failure. The Potatoes look very healthy in Nottinghamshire. Turnips, in all probability, will be an average crop, although in some few instances they have been entirely destroyed by the fly. Fruit is very abundant all over England. For full remarks on the crops I refer you to the observations from different people from every county, commencing in the North of England.

NORTHUMBERLAND.—*Berwick-by-Wooler.*—"We had a remarkably fine winter, and the months of February and March were favourable, though stormy. March was very wet till about the 22d, when it set in dry, and continued so until May 9th; then we had two wet days. It rained also on the 17th and 19th, succeeded by dry weather. Rain occurred on 7th June, followed by high winds, amounting to a gale on the 13th; it rained on the 17th and 19th, since which it has been generally fine. The season on the whole has been very dry. Wheat looks very well; spring Wheat, though thin, looks well. Clover and seeds are bad. Barley has borne the cold dry weather better than might have been expected. Oats look promising, but very short on the straw. Turnips look very well, except the early sown varieties, which are very irregular. Pastures are bare, but green."—*J. C. Langlands.*

CUMBERLAND.—*Hurraby, Carlisle.*—"We have two kinds of land—strong clay-bottomed and light sandy. On the former, crops are good; on the latter they have been burnt up by the drought—(the former land prevails). Grass is very light on all lands; Wheat very good; Oats and Barley in most places good. Turnips promise well. Fruit very abundant."—*J. Atkinson.*

WESTMORELAND.—*Kirkby Those.*—"Wheat looks remarkably well, and a greater breadth than usual has been sown. Barley is a slender crop, less than we have had it for some years. Oats are very short, and cannot possibly reach an average. Potatoes are greatly deficient, dry-rot being general; I have seldom seen such a falling off on all kinds of soil. Turnips promise well. Clover and sown Grass will not be more than one-third of a crop; this observation also applies to meadow Grass."—*J. Crosby.*

Bownese, near Kendal.—"The crops of every description in this hilly district appear to look better than in any other portion of England that I have lately travelled over. I have consulted the best practical agriculturist in the valleys (Mr. Ullock) on the subject; the following are his remarks:—Wheat is above an average; Oats are a fair, healthy crop, though rather short; Potatoes are abundant; Grass about three-fourths of a crop, of better quality than usual."—*Mark Beaufoy.*

Lancashire.—*Chaigeley, near Clitheroe.*—"The prevailing wind for the last two months has been north-west, which has done much injury to the crops. Hay is much later than usual, though I do not expect it to be below an average. Many of the fields have reservoirs for flooding, which makes them feel the want of rain less. Potatoes have suffered the most, many of the sets never having vegetated, from the effects of dry weather. Beans are shorter than usual, but look very promising. Pasture Grass is rather below the usual average."—*W. Winstanley.*

Woolton Lodge, Woolton, near Liverpool.—"The constant dry weather we have had for the last three months has made the Hay crop very scanty; the old meadows, except on flat and moist districts, will not yield one-third of a crop. We have had rain within the last seven or eight days, which has improved the promise of Corn. Oats and Barley will be well headed, though short on the straw. Wheat looks very well. Our neighbourhood is more occupied as dairy farms, and there is a great scarcity of Grass for the cows."—*Dr. Winstanley.*

Yorkshire.—*York.*—"Grain crops generally look well, especially Wheat. Beans are very short; Turnips promise well; Grass is generally about half that of last year, or less, especially in the calcareous districts of the East Riding. Potatoes seem likely to be a good crop."—*J. Backhouse.*

Hall Gate, Doncaster.—"In this neighbourhood, although there is much sand and gravelly soil, the crops have not suffered nearly so much as was apprehended. I never saw Wheat look better. Hay crops have been light, and in some places have completely failed. Barley looks fine, and other crops look well."—*J. Hawley.*

Caernarvonshire.—*Brynybria, near Conway.*—"Owing to the continued dry weather, spring Corn and Grass have suffered much. Hay crops are very light; Grass is very much burnt up; Potatoes very irregular; Barley very bad and very short; Beans and Oats are very short; Wheat in general looks fair, but not heavy."—*J. Williams.*

Cheshire.—*Neston.*—Wheat is an average; there is very little Barley sown, but it looks well; Oats look poor; Hay is very light, and pasture-land is burnt up; early-sown Turnips look well; south of us Corn and Potatoes look better."—*W. Quay.*

Derbyshire.—*Ripley.*—"Owing to the continued dry weather, Oats and Barley will be below an average. Wheat looks remarkably well; Hay crop is very small. I was near Chesterfield a few days ago, and should say the Hay crop there is near an average."—*J. Royston.*

Hedale, High Peak.—"The crops generally look very well. Wheat and Barley are very good, but much must depend upon the weather for the next two months; for we do not commence harvest until the end of Sept. or beginning of Oct."—*S. Langworth.*

Nottinghamshire.—*Ruddington Grange.*—"I never saw the Wheat universally, and the Barley generally, more promising to yield well. Wheat always does well upon the new red sandstone formation in a dry spring; the straw is firm, and the grain appears well fed. Barley short, but good; Beans short in the straw; Peas exceedingly well podded; Clover, where not spring cut, is a fair crop, say 30 cwt. to the acre; meadows which are not irrigated are exceedingly deficient—not more than one-third of a crop; Mangold Wurzel looks well, and also Turnips."—*C. Paget.*

High Field House, Lenton.—"Grass seems to be the chief thing which has suffered by the long drought; the Hay crop will not reach half an average; Clover and seeds look rather better; Wheat looks very well, and also Barley, though the latter is rather short on the straw. Oats, I fear, will not reach an average, and will be very short; Beans had, a few weeks ago, the appearance of a wretched crop, but are vastly improved; Peas, I think, will not attain an average; Potatoes look wonderfully well, excepting when on the sandstone rock, which are not so promising. Turnips look well, though we have a few exceptions, some fields having been totally destroyed by the fly. The soil generally is a rich clay, but part is on a sandstone bottom; on the latter the crops have suffered much for the want of rain, for we had scarcely any in the months of April, May, and June. Fruit is very abundant."—*E. J. Lowe.*

Marston Grange, Retford.—"I do not consider the effects of the weather will be serious to the crops. Wheat appears very good and rather early. Spring-sown Corn has not such a good prospect."—*R. Houghkinson.*

Lincolnshire.—*Boston.*—"Crops are greatly improved by the late rains. Wheat will be an average; Oats and Beans deficient; Barley is not grown here; Potatoes fair crop. The meadows are very light."—*S. Veal.*

Shropshire.—*Whittington Rectory, near Oswestry.*—"The pastures are very bare, and Hay very deficient, being only one-third of the usual crop; Potatoes will not be half the usual crop; Turnips are very unpromising; much Oats and Barley are short, (the former 6 inches high on poor clay land); Wheat short but very clean and good. With respect to cattle much depends upon the weather for the next six months. Some farmers have mowed their Oats to give to their cattle; others have cut for them branches of trees. Ox cabbage are not grown to any extent, but there are complaints about them: my own are doing well. Fruit is very abundant. I anticipate great destruction amongst the bees next winter, for they are scarcely collecting any honey."—*C. A. A. Lloyd.*

Staffordshire.—*Forsbrook Rectory, near Stone.*—"I find the last rain in April was on the 5th; wind in that month from N.W. to N.E.; thermometer from 40° to 46°, barometer from 29.400 to 29.800; no rain in May, and wind almost always N.E. to E. In June a slight shower on 24th, two hours' rain on 25th, and in July 24 hours' rain on 4th; wind in June and July being chiefly N.W. I have been in various parts of the country, but I see we are more favoured than other places, the land not being drained, and full of springs, which has suited this season; Wheat is thin but well headed, (straw about 3 feet 6 inches high); Oats average from 2 to 3ft. 6 inches high; Barley good (not much sown); Potatoes have failed generally; I have seen no Turnips—those sown in first week in May never came up till the rain in June, and then the fly took them; Clover does not average above 10 cwt. to 15 cwt. per acre; Hay and the meadow land, where it is not watered, is a burlesque upon Hay-making."—*J. Curtis.*

Leicestershire.—*Castle Donnington, (Rectory).*—"Hay and Grass have suffered very much from the dry weather; crop very small. Wheat is very good; Barley and Oats have suffered much from the dryness, but since the rain fell have much improved, probably the crop will be below an average; Peas and Beans look very well, except the latter in places, which look badly; these are observations on the hills which are red clay, of the new red sand-stone formation. With regard to the crops in the valley of the Trent, which is composed of gravel and alluvial soil, Wheat is better than average, excepting partial failures on the gravel; Hay and Grass very failing; Barley much improved and likely to be nearly an average; Oats less favourable; Peas good, Beans improving, but it is doubtful if they will reach an average."—*S. K. Swann.*

Charwood Forest.—"The crops are rather late, though they look well on the whole. Wheat is rather thin, but will be an average. Oats are very short; Barley full of weeds; Hay-crops remarkably light. Turnips and Potatoes look well."—*E. J. Lowe.*

Rutland.—*Empingham.*—"The depth of rain fallen during the spring quarter was only 1.52 inches, which is not much more than half the quantity that fell in the corresponding quarter of the remarkable year 1826, and the mean temperature in the shade was 10° greater than the average of several years recorded by Luke Howard, Esq., in his 'Climate of London.' Wheat is a splendid crop, owing to the dry weather; Barley was very little sown—some was sown so late as 21st June; the crop is very thin, and the late rain has caused a second crop to spring up; there will not be above one-third of a crop, and the quality very inferior—on cold land the crop looks well; Oats look very well, but short; Beans and Peas fall short of an average; Tares the worst ever known."—*W. Fancourt.*

Herefordshire.—"Wheat is a very good crop; Barley a complete failure; the same may be said of the Hay crop; Oats are light."—*J. Walker, Worcester.*

Worcestershire.—*Honeybrooke House, Kidderminster.*—"The long dry weather has been most detrimental to the Hay crops, not having any rain worth notice from Good Friday till 2d July; the generality of the crop is not more than half a ton an acre, while last year they were able to procure more than one and a-half ton. The grain is better than could have been expected—I should think on the whole a fair crop. The Potatoes turn out very badly, and as this is a Potato country, the loss will be considerable."—*A. Talbot.*

Warwickshire.—38, *Waterloo-street, Birmingham.*—"The Grass crop has been almost universally a failure. One gentleman cut only six tons from 20 acres; even low lands have been barren of produce. Wheat is an average; Rye an average; Oats rather deficient—they equal about two-thirds of a good crop; Barley is still worse, not more than half a crop; Beans are worse still; between frost and drought they will not reach more than one-third of a good return; Turnips are promising."—*S. Wright, M. D.*

Northampton.—*Courteen Hall.*—"Wheat is an average, the heavy and deep soils making up any deficiency there may be in the light and sandy lands; Barley, Beans, and Oats, are no doubt a failure. Hay there is, literally speaking, none; Turnips look well."—*W. Grey.*

Huntingdonshire.—*Little Burford Rectory, St. Neots.*—"In my situation on the plastic clays, the Wheat is thin with a good head; Peas ditto; Tares and Mangold Wurzel almost a failure."—*J. Arlington.*

Cambridge.—*Ely.*—"Wheat is an average; Barley good on heavy land, but very bad and late on light soils; many fields have been drilled in since 25th June. Oats on the high lands are bad, but on the Fens it will prove a good crop; Peas, though short, are well-podded and full; Beans are much improved of late; Hay crop is very poor; 2d crop of Clover looks well; Turnips (as some farmers say) look patchy, being two crops—those up before the rains, and those since; but on the whole I think they look well."—*G. Archer.*

Observatory.—"Wheat crop fine; Barley has failed very much, owing to the continued dry weather in spring preventing proper tillage. No Oats sown here; Hay very light."—*J. Glaisher.*

Norfolk.—*East Dereham.*—"An average harvest—the Corn not being injured by the drought."—*J. Peto.*

Pulham, Harleston.—"We may anticipate a full average crop. Barley will be inferior, part of the seed having vegetated since the rains, so that the crops will come in at twice; early sown Barley is very good—on the whole we shall have three-quarters of an average; Oats better than Barley, but are very little grown. The rain came in time to save the Pea crop, which will be an average; Beans have suffered very severely by the drought, there will not be above half a crop."—*R. B. Harvey.*

Suffolk.—*Thwaite.*—"The recent effect of copious showers has wrought magic in our fields; the Corn, except on light soils, is looking exceedingly fine; finer Wheat I never saw."—*O. Whistlecraft.*

Essex.—*Kelvedon.*—"Wheat looks excellent; the yield will be eight bushels more per acre than last year. Barley, Oats, &c., were looking bad, but the late rains have made a wonderful difference. A few days since we had a heavy mildew, which I am afraid will do injury. I was lately through part of Suffolk and the crops look very well."—*W. Wiseman.*

Saffron-Walden.—"The effects of the weather have been to reduce the Hay crops to quarter the usual average; Oats and Barley bad, except that early sown; Beans and Peas very dwarf. Clover and Trefoil almost destroyed on the lighter soils; Wheat a good crop, except in gravelly soils. Since the rains Oats and Barley have greatly improved."—*T. Spurgin.*

Dunmow.—"Wheat a good crop, though short in some places; Barley on clay lands, and where early sown, exceedingly good. In the Ruthing district, doubtless there will be a full average. I have had brought to me an ear of Barley having eighteen kernels on each side, and some of twenty have been picked from the same piece. Peas, though not generally a large crop, yet greater than anticipated; Beans very bad; few Oats sown, but what are, look bad; Turnips looking well; Mangold Wurzel nearly a failure."—*A. Barfield.*

Kent.—*Sandwich.*—"Wheat generally very good; Barley light and thin; Oats an average; Peas a very short crop; Beans likely to improve, but not very abundant."—*W. H. Weekes.*

Sussex.—*Parham, Petworth.*—"If the weather prove favourable there will be an average crop of Wheat; the Lent Corn is far from being good; Oats, Peas, Beans, and Barley, are all defective. The Hay crop is very light, many farmers not gathering more than half a load per acre."—*J. Morton.*

Surrey.—*Godstone.*—"Dry weather commenced on 25th March and continued till 25th June, when we had a heavy storm followed by showery weather. Wheat more than an average; early sown Barley very good, late sown quarter less than an average; Oats an average; Beans very indifferent, full of blight, never can be an average; Peas very good; Turnips look remarkably well."—*E. Steaming.*

Middlesex.—"Hay is far below average; Wheat generally fine; Oats and Barley thin and light; Turnips do well; Potatoes are not defective. Great abundance of fruit."—*W. H. White, Royal Adelaide Gallery, London.*

Hertfordshire.—*Redbourn.*—"Wheat, with few exceptions, is above an average; Barley very bad, one patch being in full ear, the next only just up; what little was sown early looks better (great deal sown from 19th to 24th June); Oats, where sown late, suffer like Barley, but from what I see there will be near an average. The meadow Grass and Clover, with very few exceptions, were quite burnt up, so much so, that in many places they could not, on our flinty land, be mown at all. The fly has made great ravages amongst the early sown Swedes, the ground was in a bad state for their reception, being in dry hard lumps; the later sown Swedes and Turnips are exceedingly promising; Vetches, except where early sown, are very bad, both for green food and for seeding; the cold wet weather in February and March seemed to perish mine, which were rather late and on strong land; Peas below an average, and Beans average not more than 12 inches high."—*W. B. Burnham.*

Bedfordshire.—*Luton.*—"Wheat is very promising; Barley and Oats have suffered considerably on dry gravelly soil, but the late rains have done wonders towards restoring the early sown Barley; the late sown has, in many instances, not come up at all. Grass crop is very short; meadow Grass, in some instances, is not sufficiently abundant to pay for the labour of making; there are some good crops in damp situations, by river sides, &c."—*W. Phillips.*

Buckinghamshire.—*High Wycombe.*—"The distinguishing feature of the season, comprehending April, May, and June, has been extreme dryness. The rain fallen during the three months only 1·537 in.; the next least quantity which fell in the same three months during the last 21 years was 2·990 in., and that occurred in 1834. But in further proof of the dryness of this season, I may state that the least quantity of rain in any one April, in the long period before mentioned, was in 1840, viz. 0·325 in.; in May, 1843, 0·381 in., and in June, 1826, 0·787 in. These, if added together, will make 1·493 in. The quantities this year were as follow:—April, 0·387 in.; May, 0·625 in.; June, 0·525 in.; added together, 1·537 in. From this you will see that the excess is only 0·043 in., when the driest months out of all that occurred in 21 years were taken. Wheat very fine and abundant; Barley and Oats very good—former better in quality than produce.—*J. G. Tatem.*"

Oxfordshire.—*Henley-on-Thames.*—"On the Chiltern hills, which are chalk with more or less clay, Wheat looks very well. Around Henley the Wheat will be a very abundant crop, many ears producing four and five grains in each spikelet. I can collect many containing 80 grains in each; but these are some of my new varieties. Early sown Oats and Barley are good, but the late sown

Barley will be very deficient; much of the seed has not come up. Grass crops are also very deficient; Potatoes very irregular."—*J. W. Jeston.*

BERKSHIRE.—*Reading.*—"No rain from March 25th to May 21st; again a cessation till June 18th. Wheat looks very well. The drought injured the summer Corn very materially. A great deal of Barley was sown in June; between Reading and Henley there are many fine fields of Barley."—*H. H. Cowslade.*

Kingston Inn, near Abingdon.—"Rain for April, 0·17 in.; May, 0 25 in.; June, 1·42 in. On June 30th we had very heavy rain. Hay very scanty, good prospect of a second crop; Wheat excellent in quality, as well as quantity; early sown Barley an average; the later sown sprang up at twice, which will hinder an average; Oats look well, but are not much cultivated; Beans tall and free from fly—in fact very good; Peas considered a good crop; Turnips very good."—*A. Murdock.*

WILTSHIRE.—*Warminster.*—"Wheat very good; Barley and Oats deficient on light lands."—*H. Robertson.*

GLOUCESTERSHIRE.—*Hanham, near Bristol.*—"Wheat very good; Barley bad; Beans partially failed; Grass very bad (from 60 acres I shall not cut 15 tons); Swedes look well; Vetches ditto; Mangold Wurzel has not come up, though sown on 10th April."—*E. Burrell.*

SOMERSETSHIRE.—*St. Saviour's, Bath.*—"The Wheat crop is looking very well; Potatoes very bad; and the Hay crop a total failure. We have not had nearly so much rain here as in other parts of England. Rain fallen from 1st Jan. to 30th June, 10·43 in.; fallen in the three months, April, May, and June, 1·32 in.; Max. thermometer on 23d June, 91°."—*C. Blathwayt.*

DORSETSHIRE.—*West Bucknowle, Corfe Castle.*—"As to the effects of the N.E. parching winds, and want of rain on the crops, Wheat on strong and deep land looks well; Barley and Oats in general very bad, much but just appearing above ground, for want of moisture; Hay crop very bad; Turnips look well. The late rains have improved all vegetation."—*W. Voss.*

DEVONSHIRE.—*Plymouth.*—"With exception of frequent rain during last week or two, we have had none since beginning of April. There is a great deficiency in all green crops. Wheat looks very well, and Barley an average."—*R. Bishop.*

Devonport.—"Wheat, though short in straw, is good in the ear; Barley very thin; Hay lamentably bad."—*T. Lancaster.*

Chagford, near Exeter.—"The drought commenced and continued, with exception of one or two slight showers, through April, May, and June; and so severe were its effects that pasture and meadow land was never known so scorched and barren. The soil is rather variable, in some cases rich and loamy earth, but more generally of a light sandy nature, composed of disintegrated granite, of which rock the entire substratum consists, with considerable quantities of peat in many of the vales. We border on Dartmoor, at an elevation of about 500 feet from the sea. Wheat will reach an average of about 20 bushels per acre; Spring Wheat cannot reach an average, having suffered much by the drought; Barley is very bad, except where drilled very deep in the ground; Oats good; Hay a complete failure; and Turnips look very well."—*R. Berry.*

CORNWALL.—*Stratton Rectory.*—"The rain that fell in April, May, and June, was 2 30 in. The drought has been very injurious; the Hay is light in the extreme; early sown Barley and Oats promise well, but late sown are very bad; Wheat looks well: it is rather short on straw, but has a good head. The pasture lands look very bare and burnt up."—*J. S. King.*

FARM BUILDINGS AT TIPTREE-HALL FARM.

THE yards are so placed as to be entirely sheltered from the east, north, and north-west winds, whilst they are quite open to the south and west for sunny warmth: it is presumed the heat absorbed by the brick-walls and buildings during the day will be retained for a portion of the night, so as to produce a warmer atmosphere in the yards. The farm and other yards are on a perfect level; they are underdrained every four yards with stones and a pipe—same as the land. All the drains (except the roof-drains) terminate in the manure-tank; so that not a pint of water that falls directly on the yards ever escapes, except into the tank. All the water that falls on the roofs is conveyed through pipes to the brook. The sheep-yards, the bullock and horse stables, are all paved perfectly smooth with hard yellow bricks, set in cement; so that no liquid manure is wasted. This arrangement admits of cleanliness, without waste, by occasional washings. The Straw for litter being cut into chaff, is applied where required, without waste. The manure-tank is bricked, and set in cement. We put into it the solid manure as made, turning the moist bottom upon the top, as occasion requires, to prevent too violent a degree of fermentation, and adding occasionally sulphuric acid in water, especially in the summer months, or an occasional layer of earth. In winter we have always sufficient moisture in the tank. As we pump out the liquid manure from the well, which is three feet deeper than the tank, no solid manure can enter, there being proper gratings to prevent it. We choose a wet day, when nothing can be done on the land, to turn over the manure in the tank—there being a slated roof over it which keeps the men dry. It faces the north; so that the sun cannot shine on it to evaporate the ammonia and strength of the manure. In the winter, when we have a superabundance of moisture, we pump the liquid manure into Crosskill's liquid manure-cart, which holds 200 gallons, and apply it to the pastures, young Wheats, or fallows; first fixing the ammonia where required with sulphuric acid, being governed as to diluting its strength by the dryness or wetness of the weather. We find the tank-manure of extraordinary strength, as well as density, from subsidence by fermentation and pressure. When filled to four feet above the ground, it contains about 200 loads of solid manure.

Manure, that is dropped in the day, is removed the following morning in barrows to the tank, so as to preserve its efficacy. The piggeries, paved with flagstones, discharge their moisture into the manure-well. The stone water-tanks in the yards and house are all filled simultaneously by one pump over a tank, 14 feet deep, bricked, and set in cement; into which is brought a never-failing stream of pure spring water from the valley below. This water formerly spoiled some acres, and caused the bog: but now it answers a much better purpose. I do not like the usual custom of giving manure-water to horses and cattle, instead of to the land. I presume they are, like ourselves, all the better for drinking pure water, instead of filthy compounds. The pump also supplies our copper, on which fits a perforated iron vessel, capable of steaming six bushels of Potatoes or other matter. This vessel travels backwards and forwards with wheels on a small iron rail; and by a lever, is capable of being filled, emptied, or placed over the copper by a strong lad. The cart-lodge is so placed as to avoid sun, and we consider a weather-tight implement house essentially necessary.

The barn is 130 feet long, 30 feet wide, and rises 18 feet before it springs the roof. The horse-power that drives the threshing-machine occupies 30 feet square on the ground-floor, and about 30 feet more is occupied by the granary and chaff-house, over which is the threshing apparatus.

The unthreshed Corn being on both sides of, and near to the threshing-machine, economises time in removal. On this account, and the facility of doing work under cover in bad weather, I like plenty of barn-room. I do not see the necessity of a steam-engine, as we do our threshing, chaff-cutting, &c., when we can do nothing else. The threshing-machine is of six-horse power; but we throw it out of gear, and work the chaff-cutter or corn-mill with two horses. We cut thirty-two trusses per hour into chaff. A crane (cost 50*s.*) fixed on the top of the granary in the barn, enables one man and a lad to load the sacks of Corn with ease, dropping them into the cart or waggon.

The iron gutters and pipes to our roofs may be found fault with on account of the expense, but I really cannot see the utility or profit of the present custom, that is, putting good and costly manure on Straw, and then washing it all out again with tens of thousands of gallons of pure water off the roofs, taking especial care that it shall poison the horse-pond, and then run down to enrich some stranger's meadow at the first flood. I hope in fifty years' time the farmer who does this will be considered insane. The idea of a man's throwing away his manure with his left hand, and with his right paying money to bring it back again, all the way from Peru or Africa, seems too ludicrous for the nineteenth century.

So far as we have had experience, pigs, poultry, and horses, thrive uncommonly well in our yards and stables, and no doubt our cattle and sheep will do the same. All our horse-feed is cut for the manger. Even our Tares and green food are cut up with Straw.

We contemplate clipping our bullocks when stalled in the warm stables, taking it for granted that Nature provided their long winter coats for open fields, as a non-conductor of caloric, and that they never were intended for artificial confinement. The thermometer will regulate our ventilation. They will be groomed every morning, the same as horses. There is quite as much reason for removing from their skins the insensible perspiration, as for grooming a horse. Health depends on cleanliness, as much in an animal as in a human being. In a state of nature, they would rub against a tree or fence. Having no such opportunity in confinement, we must do it for them. Some butchers agree with me that farmers often spoil the mutton as well as the fleeces, by keeping them on too long. Besides, a long coat requires support all the winter, as well as any other part of the body.

As to a good house, why, if our farmers are to be men of education and capital (which I hope they will be when they get Agricultural Colleges), I do not see why for a few pounds extra per annum, they should be deprived of the comforts of a proper residence. As my substantial brick and slate buildings are thought to be in advance of the age, I hope those who find fault with them will consider they are intended for the next generation.

If board and thatch are so very durable and advantageous in farmeries, why not apply them to towns and cities? My own opinion is, those temporary erections indicate either poverty or miscalculation. If there is "philosophy in frying a pancake," why should there not be "an adaptation of means to the end" in planning and erecting farm buildings?

In conclusion, as some of my farming operations are on so very different a plan from the common routine of proceeding, I will allow my farming friends to laugh at, but not to condemn them, till they have had an opportunity of seeing whether they answer or not. Should they by chance succeed, I shall expect those who now enjoy the joke will have the good sense to follow the example set them. If they do not, I shall certainly take care to remind them that they ought so to do.—*I. J. Mechi*, 4, *Leadenhall-street.*

ON MINERAL AND INORGANIC MANURES.

No. XXIII.

BY PROFESSOR CHARLES SPRENGEL.

6. *Ashes.*—As the ashes of the different sorts of fuel, of the various woods and peats for instance, of brown and common coals, &c., are of a very diversified composition—*i. e.*, as one sort contains much of potash, and another none at all, and so on—it follows that their value as manures will be very different. And this is a fact borne out by experience, as we know that the ashes of some sorts of timber are very useful, whilst those of some sorts of peat are useless. Several sorts of ashes, as they contain no substance which decomposes the humus or other ingredients of the soil, act merely as food for the crops, whilst others act as solvents, as well as by nourishing plants by their component parts. The latter are, therefore, superior manures, although the former also possess comparatively a great value. As the effects of the different sorts of ashes are so diversified, we shall treat of them separately.

a. Wood and Vegetable Ashes.—Wood and other vegetable ashes are used for manure either in their original state, or after they have been washed; but as in the former they are always very expensive, they are generally used in the latter. The refuse ashes are procured from bleacheries, potash and soap-boiling factories, being there used for the making of ley and carbonate of potash. These are always mixed with lime, which is added to it in order to make a caustic ley. If we, therefore, consider that vegetable ashes are deprived by water, not only of the potash, but also of all salts easily soluble in water (although some slight portion may still remain in them), it will be evident that ashes in their original state will always act more powerfully than after they have been thus extracted. But as the mineral ingredients of ashes, not soluble in water, are also to be found in different proportions in the ashes of the different woods and other plants, it follows that one sort of extracted ashes will benefit vegetation more than another. We shall first investigate ashes in their natural state, and explain their action, which cannot be done without knowing their chemical ingredients, which will best determine their value as manures. It would take up too much space to treat of all sorts of ashes used in agriculture; some of the most commonly used will suffice for our purpose.

1. *Ashes of the Red Beech.*—100,000 parts consist of—

5,520	parts	of silica.
2,330	,,	alumina.
3,770	,,	oxide of iron.
3,850	,,	oxide of manganese.
25,000	,,	lime.
5,000	,,	magnesia.
22,110	,,	potash, partly combined with silica.
3,320	,,	soda.
7,640	,,	sulphuric acid, combined with potash and lime.
5,620	,,	phosphoric acid, combined with lime.
1,840	,,	chlorine, combined with sodium.
14,000	,,	carbonic acid, combined with potash.
100,000	parts.	

Fresh *Beech-wood* ashes contain always less carbonic acid than is here stated, as lime and magnesia will (if the ashes are exposed to the air) attract the carbonic acid, and combine into carbonic salts; whence it follows that the per centage of this substance will be different, if the same sort of ashes be examined in a fresh state and after being exposed to the air.

2. *Ashes of Oak.*—100,000 parts consist of—

26,947	parts	of silica.
8,146	,,	alumina, oxide of iron, oxide of manganese.
17,380	,,	lime.
1,442	,,	alumina.
16,200	,,	potash, partly combined with silica.
6,730	,,	soda, ditto.
3,365	,,	sulphuric acid, combined with potash and lime.
1,920	,,	phosphoric acid, combined with lime.
2,408	,,	chlorine, combined with sodium.
15,468	,,	carbonic acid, combined with potash, lime, and alumina.
100,000	parts.	

3. *Ashes of the Pine.*—100,000 parts consist of—

6,593	parts	of silica.
17,030	,,	alumina, oxide of iron, oxide of manganese.
23,182	,,	lime.
5,016	,,	magnesia.
2,198	,,	potash, partly united with silica.
2,220	,,	soda.
2,228	,,	sulphuric acid combined with lime.
2,743	,,	phosphoric acid, ditto.
2,300	,,	chloride of sodium.
36,485	,,	carbonates of lime, potash, and magnesia.
100,000	parts.	

Fresh wood ashes contain also very often sulphuret of potassium, sulphuret of calcium, and manganate of potash; the sulphurets form (by longer exposure to air) sulphates, whilst the manganate of potash is changed into carbonate of potash and oxide of manganese.

All sorts of ashes formed under a high degree of heat, contain somewhat less potash than those formed under a less intense heat, as the potash (potassium) is partly expelled, and this should be taken into account in purchasing ashes; the former will act also less powerfully, as the great heat will cause a vitrification of the potash with the silica.

Looking at the above analyses, therefore, it will be evident that the ashes of Beech must be the most powerful, as it is the richest in lime, alumina, potash, sulphuric

and phosphoric acids. Experience has confirmed this. If 1000 lbs. of fresh Beech ashes are brought on the Magdeburg acre of land, the soil will receive thereby 250 lbs. lime, 50 lbs. magnesia, 221 lbs. potash, 33 lbs. soda, 76 lbs. sulphuric acid, 56 lbs. phosphoric acid, and 18 lbs. chlorine, whence it will be seen that several crops will be thus provided with these mineral substances. It is equally obvious that an equal quantity of Pine ashes will produce a less effect, because if the acre is manured with 1000 lbs., this will amount only to 21 lbs. potash, 22 lbs. sulphuric acid, and 27 lbs. phosphoric acid. And although the amount of lime is nearly the same in Beech and Pine ashes, still potash and the sulphuric and phosphoric acids are the most important ingredients of fresh ashes. The ashes of Pine act, it is true, also in respect of its carbonate of lime decomposing the organic matter in the soil, but the same is done by the carbonate of lime of Beech ashes, which effect is there increased by the greater amount of carbonate of potash; the more so, as potash is a stronger basis than lime.

SUGGESTIONS RESPECTING TURNPIKE TOLLS.

When I first heard of the appointment, by Her Majesty, of Special Commissioners to inquire into the grievances of South Wales, the origin of which grievances, and the subsequent insurrectionary actions of the Rebeccaites, was the unreasonable number of turnpike gates, erected by various turnpike trusts, and the consequent exorbitant demand for tolls, it immediately occurred to me that a plan of a less objectionable character might be devised for raising money to keep the turnpike roads in proper repair; I have subsequently reflected much upon the subject, knowing that the grievance was not confined to South Wales alone, but extended over the major part of the kingdom. I anticipated a general measure would have been resorted to, but finding a Bill brought before Parliament, only embracing South Wales, I venture, without entering into matters of detail, to publish a brief statement of a scheme, which I forwarded to them on the 1st January last.

In the first place I would suggest that all toll-gates should be removed, with the exception of those in the immediate vicinity of towns, where they may be allowed to remain, together with the attached houses, and made available as ticket stations. These premises would be eligible residences for Police officers and their families, who could thereby officiate in a double capacity; by attending to their constabulary duties, and also by giving tickets to, or receiving tickets from, travellers, according to circumstances.

Secondly.—All persons travelling by horse, gig, carriage, &c., and the proprietors of mail or stage-coaches, waggons, vans, &c. to take out an annual licence according to mileage or other specific arrangement. But all horses, carts, waggons, &c., used for purposes of husbandry, or carrying lime, guano, or any other kind of manure to and from farms, (except for hire,) and also for carrying agricultural produce to market, to be totally exempt. Districts to be formed under the special direction of Government; in these it would be necessary to station efficient officers for receiving, quarterly, the moneys paid for the various descriptions of licences; which moneys are to be disposed of in the following manner: viz.—to pay the creditors of the turnpike trusts interest upon their various secured sums at the rate of 4 per cent. (or the whole debt may be funded by Government at 3 per cent.), and the surplus to be divided *pro rata* £ per mile, for keeping mail and coach roads in repair; and £ per mile for other turnpike roads.

Thirdly. The present Turnpike Commissioners to be Local Commissioners, under whose superintendence the mileage allowance is to be expended.

Fourthly. Highways to be kept in repair by the occupiers of houses and lands within the respective townships, hamlets, or districts in which such roads are situate; land owners to contribute of the sum required for general improvements.

Fifthly. Vested interests in toll-gates to be protected; and, if possible, purchased.

Those persons, therefore, who make use of private carriages or horses, such as commercial travellers, &c., must take out an annual licence for that purpose, and the owner or owners of every coach, waggon, van, or other carriage used for hire or profit, with the exception aforesaid, must take out an annual licence regulated according to the average number of miles travelled during the three preceding years. From a calculation made in accordance with the foregoing suggestions, I have deduced the following result: viz.—That after paying 4 per cent. upon the sums secured to the creditors of the turnpike trusts, reserving annually a large amount for a sinking fund, and an adequate sum for surveyors, as also to meet incidental expenses, there will be a sufficiency for keeping the turnpike roads in repair throughout England and Wales. Were the above circumstances taken into serious consideration, no one, I believe, would entertain a doubt of the superiority of the scheme over that at present in force; that is to say, receiving tolls once in about every five miles. It will also be admitted, I apprehend, that persons contributing to the maintenance of turnpike roads will not have to pay nearly so much as under the present system; and likewise the charges for repairs of gates, toll-houses, law charges, clerks' salaries, and other expenses will be saved; at the same time affording just protection and encouragement to the agriculturist.—*Morris Sayce, Kington.*

Home Correspondence.

Saving Corn in Damp Weather.—In the laboratory we are in the practice of drying materials which do not bear heat, by aid of substances having strong attraction for moisture; one of which, lime, being largely used in manure, might be employed for drying the Corn, at no other cost than the labour. If the rick be made hollow, with the grain turned inward, a sufficient quantity of fresh quicklime placed within, and then all placed in from bottom to top, and covered over to exclude the external air, the lime will rapidly dry the air within, which will as rapidly draw moisture from the Corn, and so continue until the Corn is dry, or the lime saturated. And as quicklime will absorb about one-third its weight of water, a ton of lime will take between 6 and 7 cwt. of water, and thus probably dry 6 or 7 tons of Corn and Straw; for all this water must come from the Corn, if the external air is well excluded, and the lime raised from the soil by a bed of stones, gravel, or Straw. The lime must not, of course, touch the Corn, and therefore room should be left for it to swell in slacking. If there be no practical impediment to this method, the farmer may be enabled to save his Corn in the most capricious seasons, without the mortification of seeing it sprouting in the ear, as it stands or lies on the ground. It must be received only as a suggestion, having never, to my knowledge, been tried on the large scale; but its success in the laboratory gives reason to hope for its efficacy in the field.—*J. Prideaux.*

Folding of Sheep, &c.—For the sake of giving additional employment to the surplus labour of my parish, I broke up last winter an old sheep-walk on the upper chalk. As I have laid out 1000*l.* in buildings on 150 acres, I am anxious to follow the most approved principle of cultivation, and particularly desire the assistance of a practical and scientific agriculturist to determine the best manner of consuming 80 acres of Turnips, which are now, despite of the dry season, full of promise. On my clay farm I consume all my Turnips, Mangold Wurzel, &c., in yards sheltered with sheds for the cattle and sheep. I follow this practice, from the very obvious reason that in wet weather it is impossible on heavy clay to consume the crops on the ground. But this impossibility does not apply to the hill (chalk) farm. The universal practice here is to fold the sheep on the Turnips during the winter. It is plain that the exposure to wintry weather must be very prejudicial to the sheep in respect of their fattening; but then it is maintained by the old school here, that the advantage of the treading of the sheep, and equal distribution of the dung and urine on the land, cannot be compensated by any other means. I beg, therefore, the help of your counsel on this point. Would you on a light, *i. e.* chalk soil, cart your Turnips, and consume them in the yard; or would you rather erect in each Turnip-field temporary shelter, such as is described in an early Number of your *Gazette*? It is clear that one must set off the cost of carting the Turnips, &c. to the yards, and then the manure back to the fields, and the loss of an equal distribution of manure on the field at the time, against the gain which the sheep will make by shelter in wintry weather. This seems to be an important subject of deliberation, applicable to all soils where the treading of the sheep would not be injurious.—*A. Huxtable.* [It is very hazardous work, acting directly in opposition to the experience of a whole district. We have no experience of a chalk soil, but we cannot be far wrong in advising you not to dispense with the treading of your land by sheep, which the farmers on chalk soils say is essential, unless you substitute something of a similar kind, such as the use of Crosskill's Clod-crusher, on your Wheats, which will enable you to adopt the economical plan (as our experience justifies us in calling it) of feeding your Turnips in sheds. Your safest plan is to draw only a portion of your Turnips at first, and feed them in sheds. The experience of a year will indicate the proper course in future.]

Carts or Waggons for Harvest Purposes.—In reference to a late Leading Article on "Carts *versus* Waggons," I can say from the experience of the two past and present seasons, that carts for harvest work, *i. e.* Hannam's harvest carts, are far superior to waggons; I will enumerate some of their advantages:—1. The cost is much less; my carts cost me 15*l.* each—they are well made. 2. They answer better than Scotch carts with wings attached for harvest work. Having one of mine fitted with wings, (I use Scotch or Cumberland dung carts, similar to those in common use, except that I have an improved way of tipping), I can speak from experience on this subject. I had three of them carrying Hay from a field about 200 yards from my homestead, where the rick was building, and having, through curiosity, noted the time it occupied to load and send them home, I found one passed my window every fifteen minutes, *i. e.* four in an hour; they were good loads well tied on and raked down—one man was pitching and one loading. As to their merits in working against waggons, I was last harvest employed in carting some heavy Oats from a field 1½ mile from the homestead where the rick was building, and I borrowed two waggons of my neighbour, which, with three harvest carts of my own, made in all five carts and waggons. I went to the field and timed the men, to satisfy myself which took the longest time to load—the carts or waggons, (this I did unknown to the men, and it should also be remembered that my men had a prejudice against the use of single horse-carts, especially for harvest work, having been always used to waggons), and I found the carts occupied one-fifth less time loading than the waggons, each carrying the same load. I can give you another instance:—My neighbour, who all along had laughed at my doing all my work with carts, was one day busy Wheat-sowing, and beginning, as I suppose, to think of economising his horse-labour, came to me to borrow my harvest carts; I lent them of course; the next day on asking him how he got on, he told me that he had done as much work, *i. e.* had carted as many Beans with my three harvest carts and three horses as he had done the day before with three waggons and seven horses; others may think this strange, I do not. Let us see what the horses had to do. Three harvest carts will weigh rather more than 21 cwt. *i. e.* 7 cwt. each. One waggon weighs about 21 cwt.—as much as three carts; the Beans were on wet land ploughed into 8-feet ridges, with deep furrows; therefore the hind and fore wheels of the waggon must have been each in the bottom of a furrow or nearly so, in crossing the lands, and it would require a greater force to pull four wheels over two ridges than a cart over one with equal loads, for the waggon must be crossing two ridges at once. Then there is time saved in turning carts; one horse also moves much quicker than three can be moved together. Let a man once try them, and I think he would scarcely be induced to go back to waggons again, on any consideration.—*I. E.*

Liquid Manure.—For several months past many of your correspondents have dwelt voluminously on this subject: in fact, so much so, that it has become the engrossing theme of your Paper; and it is right that its merits should be discussed and made known; but it is too absurd to imagine that such wonderful results are to follow the application of liquid manure to land, as some of your able writers have described. I have a large cistern, a pump, and a liquid manure cart—all that is needful for going to work on a large scale. I have tried it on Grass lands, fallow for Potatoes, Wheat and Beans. I have applied gypsum with the same at the rate of from two to three cwt. per acre, but I have not yet perceived any very wonderful or astonishing results, although I have used it in wet weather, in dry weather, in spring, summer, autumn, and winter. It has proved useful, and done some good, and I do not wish to discourage the purchasing of pumps, carts, the sinking of wells, &c., &c.; only I would recommend that some of our most sanguine liquid manure men would be a little more moderate in their praises until evident results have been witnessed. It is my humble opinion that it would be far better, and more economical, to put burnt soil, turf, or road-scrapings, a foot thick, at the bottom of our farm yards, early in the autumn, to absorb the same, than to be at the expense and trouble of conveying it in carts from the cistern. It requires two horses to convey two hogsheads to the land when the ground is at all wet, and especially should the distance be far, it is a very serious expense. It is my invariable custom to put my store sheep into yards during the winter months. Last winter I had the bottom of one of the sheep yards covered with soil. It absorbed the moisture, kept the yard dry, and my sheep were remarkably healthy, free from foot-rot, and never wintered better. In turning the soil up with the manure in the spring, I found it thoroughly impregnated with the urine from the sheep. I should imagine that one cart-load of the said soil contained a very great quantity of the very best liquid manure. The expense of conveying it to the land has been considerably less than taking it from the cistern; besides I had an opportunity of putting the whole on my Turnip land at a seasonable time, whereas I could not have saved it in my cistern for the same purpose, as no place would have been large enough to have contained it. With all due deference to the opinions of the tank men, I would advise a trial of this plan previously to making cisterns, purchasing pumps, carts, &c., as I am of opinion it is the best way of securing the liquid manure, and by far the least expensive in conveying it to the land. In conclusion, I would beg my brother farmers to well digest the sage advice given by the noble President of the Royal Agricultural Society, at the late dinner at Southampton:—"Try cautiously those things which are likely to succeed, and do not expend large sums of money in things which you do not know whether they will succeed or not. If you find your experiments succeed, then go into the matter gallantly and well." So say I.—*Henry Hudson, jun., Wick, near Pershore, Worcestershire.*

Proper time to harvest Wheat.—I have to suggest, for the consideration of some of your correspondents—from whom I hope to hear through you upon the subject—the following considerations with reference to the ripening of grain crops. If a plant of Wheat be examined some two or three weeks before ripe, it will be found that the lowest joint, or perhaps the two lowest joints, are already yellow, ripe, and dead. The upper part of the straw—the ear and grain—are, however, still green and juicy. Now what I have to suggest is, that as the only connexion between the plant and the ground is useless for the conveyance of nourishment, and as the leaves, the only connexion between the plant and the air, may also by that time be considered as nearly useless and dead, the plant—straw and grain—must contain *then* all the nourishing material which it ever can acquire, however long it may be allowed to stand, to whatever stage in the process of ripening it may be allowed to reach before it is cut down. If this be so, the inference naturally follows that grain may be cut greener than is the general practice. And possibly in late districts, when the grain has been cut altogether green, the increased value of the crop (Oats for instance) as fodder, from this circumstance, may partly compensate for the loss which the farmer has sustained in losing a crop of grain.—*M. S.*

Steeping of Seeds.—I shall be happy to communicate the results of my experience in steeping seeds, when the proper time arrives for doing so, in the hope that I shall receive more valuable information in return. In the meantime I may safely state what may now be held as fact. The Corn steeped is taller than Corn not steeped,

growing side by side with it; it is also of a different colour, being of a lighter green. These remarks are true of Oats and Barley; Wheat steeped is taller, but of a darker green, and apparently later than Wheat unsteeped. Different steeps give different colours to the growing crop; thus, a steeping in nitrate of soda alone gives a darker green, and greater luxuriance than a steep compound of nitrate of soda and guano. We, in this part of the country (South of Scotland), are very much infested with black and useless ears in our crops of Oats and Barley this season. On the steeped portions of the fields there are fewer black ears; very few comparatively where the steeped seed was dried with lime, but a great many more where it was dried with soot alone. As soot is much of the same nature as charcoal dust, I do not attach much value to your recommendation to try this latter substance. Half a bushel of Oats were steeped for 24 hours in a pretty strong solution of bones and sulphuric acid (one by weight of the last to two of the first, with an equal weight of water). The Oats were sown moist and warm; black ears are rarely to be found where these were sown, while the ridges on each side are so full of them that if you walk through them you will be made as black as a sweep. My steeps consisted chiefly of guano and nitrate of soda; my rule was to give 1 lb. of each to a bushel of grain; but it was not strictly adhered to—generally exceeded, I believe. I seldom steeped longer than 48 hours, but I have reason to believe that steeping for a longer period will increase the fertility of the seed, although at the risk of injuring the vital power of it. What strength would you consider as the right strength of a solution in which Wheat is to be steeped 60 hours? Would sulphuric acid weakened with water, and thrown upon a heap of seeds, newly taken out of a steep, and afterwards mixed with lime, have the effect of forwarding or retarding the drying of the grain? I find that sulphuric acid, in strong solutions, has the effect of retarding the drying of the seeds.—*A Susbcriber.* [Your first question can only be answered by an experience which we do not possess. With regard to the second, we should certainly say the throwing of sulphuric acid of any dilution must be a very hazardous operation. If the acid be present in sufficient strength it would altogether destroy the texture of the seed.]

Bark of Trees.—Your inquiry about protecting trees from being barked by cows is answered by stating that the dung of dogs—Album græcum of chemists—mixed with lime as a wash, and applied to the trees, will prove effectual against all animals, sheep, hares, rabbits, horses, and cows. It may be coloured by soot, to take off the glare of the lime.—*X.*

Turnip sowing.—The following particulars are much at your service, should you think them worth a place in the *Gazette*; their publication may possibly prevent other parties falling into the same unpleasant predicament with myself. Owing to the very dry state of the ground I took unusual pains this season with my Turnip sowing: I procured the best varieties from an eminent London firm; I procured a box of Campbell's mixture to make a fertilising steep; and I prepared my manures in the most approved manner; besides all this my ground was in excellent order; and yet at this moment I have scarcely a single plant in three fields. I attribute this total failure entirely to the use of Campbell's steep. I have come to this conclusion from the following circumstance: I gave some of the steep to a tenant occupying a neighbouring farm, requesting him to immerse a small portion of his seed, and sow with it two bands in the middle of his field, which he did. These two bands now show a complete failure, whilst the rest of the field is covered with strong healthy plants; the entire field was drilled on the same day, and all circumstances similar, excepting the steep. Mr. Campbell's instructions were minutely followed, the seed being steeped 12 hours, and dried immediately afterwards in a current of air. The following are the particulars of sowing, &c:—No. 1. Sown in May with Laing's improved Swede: manured with a mixture of bone-dust, woollen waste, and liquid manure from the farm-yard, the whole mixed a fortnight before using, and in fine order. No. 2. Sown early in June with Dale's hybrid Swede; one-third of this plot manured with ashes and cloacine, the remainder with a mixture of farm-yard dung, woollen waste, and liquid manure, well mixed and in fine order. No. 3. Sown early in July with Gibbs's white Globe; manured with rotten farm-yard dung. In the middle of June, no plants having appeared in No. 1, it was resown, the seed steeped as before; there is now (July 25th) scarcely a plant in any of the lots, although there has been abundance of delightful rain. I am now sowing Nos. 1 and 3 with white Globe and red Norfolk, the seed unsteeped; No. 2 will be sown with Wheat in September. I am greatly disappointed, as you may suppose, and know not what will become of my cattle next winter, the hay crop being also deficient. In case of need I send you my name and address.—*E. R.*

Societies.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

At the Weekly Meeting of the Council on August 1, the following programme of the proceedings for the great meeting was agreed to:—The business of the Council was divided into two departments, namely, the show-yard department, and the distribution of tickets; the first of which would be transferred to the Horse Bazaar, Stephen's Green, on and after Monday the 12th of August next, while the managing committee would meet at the Society's Rooms in Sackville-street, and sit constantly from day to day, for the general dispatch of business. It was ordered—That the entrance tickets for stock into the show-yard, should be distributed by the clerk of the yard, at the Horse Bazaar, Stephen's Green, on and after Monday, the 12th inst.; and that all the tickets for admission to the different entertainments should be distributed at the Society's Rooms in Sackville-street, on the same days respectively. From the great increase of new members, and the demand for tickets, it was found advisable to confine the issue of them still to Members of the Society, Subscribers to the Local Fund, and Strangers from England and Scotland; but that, in the meantime, every facility would be given to enable persons anxious to participate in the proceedings of the meeting to become Members of the Society, for the purpose. The Council then adjourned until the next week.

FARMERS' CLUBS.

Maidstone.—At the monthly meeting of this Club, the subject for consideration was The Comparative Advantage of Large and Small Farms. The discussion was introduced by the reading of some sound and excellent remarks on this subject from the first chapter of "British Husbandry," and a very interesting conversation ensued. On the part of small farms it was argued that they admitted of much closer attention being given to minute details, and that as the profit of farming mainly depended on small saving, the small farmers were most productive. In support of this view, the happy state of the people in Germany, Norway, and Switzerland, where the farms are all small, and worked by their owners and their families, was compared with the pauperised state of the population in Suffolk, Norfolk, and Yorkshire, where the system of large farms prevailed. It was also contended that as the small farms thus provided livelihood for a greater number of families, they were more advantageous both to the individuals holding them and to the nation. On the other hand, it was argued that the happiness of the small farmers alluded to arose probably more from their own provident habits than from the size of their farms; and it was added that in many of those countries mentioned, in Switzerland, for instance, the population was stationary, or nearly so, whilst the Irish small farmers, who were celebrated for their early marriages and improvident habits, were amongst the most destitute people in the world. An instance was mentioned in which a gentleman of large landed property, who imagined that small holdings produced most public happiness, pulled down his large farm houses, and laid out his property in small farms of from sixty to eighty acres. He soon found tenants, who went on well enough for the first year or so, as they employed no labour beyond that of their own families; and at times wanted employment to fill up their own time. This they could not get, as they were all small farmers together, neither of whom had capital to employ any one, and each wanted to be employed. The result was that in a year or two every one of these tenants gave up his small holding, and the landlord laid his estate out again in large farms. It was stated that the race of small farmers with small capital, who might be considered half farmers and half labourers, were least disposed, both from want of means and information, to adopt any improvements; they were always compelled both to buy and sell at a disadvantage; that in every period of agricultural pressure they were invariably the first to suffer; and it very frequently happened that themselves and their families, if they were not employed as labourers by the large farmers who succeeded them, were at last reduced to the union house. Such cases had repeatedly occurred under the old poor law. In the earlier part of the discussion it seemed to be generally imagined that the small farmers gave a larger amount of employment in the aggregate than the large ones, but so many instances were adduced where the reverse was the case in whole parishes, that it was ultimately the opinion that the large farmers gave the most. Even supposing, however, that three times the amount of produce was raised on a farm of 300 acres, than was raised on three farms of 100 acres each, it was still contended that it was for the benefit of the community, as well as of the farmer, that the largest possible amount of produce should be raised from a given space of land, with the smallest possible cost. It was admitted to be almost invariably the case that the small farmers only turned off their men during the winter, whilst the larger capitalists almost always found them some profitable employment. It was admitted that, from the comparative deficiency of supervision, the large farmer seldom got so much work out of his labourers as the small one, who generally also got more out of the dairy, piggery, and poultry; but it was believed that those advantages were more than compensated for by the great advantages of capital, which enabled the large farmer to adopt a uniform system, to purchase the best implements and machines, and to apply, in catching seasons, a large amount of force to any given operation. The following resolution was ultimately agreed to:—"Resolved, That it appears to the members of this Club, that in this district it is most beneficial to the community at large that arable farms should not exceed 500 acres in extent, nor be less than 250 acres."

Darlington.—At the monthly meeting of this Club, held on Monday last, the subject under discussion was, The best Method of Making and Securing Hay; also The best Season of the Year for applying Manure to Grass Land. Henry Chapman, Esq., the chairman, introduced the subjects, and read an interesting paper thereon from the pen of Mr. Davidson, a regular correspondent of the Club. During the discussion which ensued, it seemed to be the general opinion of the members present that, in fine sunny weather, experience has already taught us nearly all that is requisite to be done in making and securing Hay to advantage; but that, under all circumstances, even in the finest weather, it is desirable to keep the Hay in such a state of security that, should a change of weather take place, no considerable injury may be sustained; it is also an important matter to economise labour as much as possible, for which purpose the Hay-making machine may be used to great advantage in dry weather. In a wet season it was considered best not to have too great a quantity of Grass cut at one time, and to allow the Grass when cut to remain in swathe for some days, should the weather continue wet, occasionally turning the swathes; but when the Grass has been spread, it is desirable to have it put up into small cocks, or lap-cocks, as soon as possible, opening the cocks out during the dry part of the succeeding days, but never opening out more in one day than can be put up again in the same day, or before rain comes on, and increasing the size of the cocks as the Hay dries. The Hay-machine should be sparingly used in damp weather, as it beats out the seeds of the Hay too much; it was also believed to have an injurious tendency by the wheels running over the Hay, and pressing it upon the damp ground. When Hay has got a good deal of weather in the harvesting, it was recommended to mix about a peck of salt with each ton of Hay in the stacking, providing the Hay be tolerably dry when stacked, salt being known to improve the flavour and quality of Hay very materially that has suffered from the weather. In discussing the best season of the year for applying manure to Grass lands, there were some members present of opinion that there was no need to manure Grass land at all, and that, by pasturing it frequently, it might be kept in condition, and the manure more profitably employed upon the tillage land of a farm; yet the majority were decidedly in favour of applying manure to Grass land, believing that, by judicious management, it might occasionally be quite as profitably applied to Grass land as to tillage; and the unanimous opinion was, that the best season for applying the manure is immediately after the Hay is taken off the land, as the manure at that time gets free access to the roots of the Grass; besides, Grass newly cut generally grows rapidly, by which means the manure is soon grown over, and the roots of the Grass receive the full benefit thereof; and at this season there is no danger of any part being washed off by the rains of winter. In cases where it is inconvenient to apply manure to Grass at this season, the next best time was considered to be in the spring, just when the Grass is expected to begin growing; and, in this climate, probably the beginning or middle of March might be suitable.

Miscellaneous.

Lucerne.—Select a dry piece of land, either rather light or good mixed soil, but not stony, strong, or clayey, certainly not the least inclined to be wet or springy, with either a sand or chalk subsoil—the latter is preferable; let it be made perfectly clean, especially from Couch-grass, and deeply ploughed; but if on a small scale I would have it dug by spade, or four-pronged carrot-fork (prongs 16 inches long and a little flattened), digging in plenty of good rotten farm-yard manure. When the ground is ready for the seed, open drills with a hoe 17 or 18 inches apart, and not more than 1½ or 2 inches deep; then put the seed in a glass wine-bottle with one or two quills stuck in with the cork (which is cut on the sides to admit the quills); this will deposit the seed more regularly than by hand into the drills, which are then raked over; about 24 lbs. of seed per acre is sufficient, which can be procured of any respectable seed-merchant, at 11*d.* or 1*s.* per lb. I consider May the best time for sowing, but if the ground is not too dry for the seed to vegetate, any time before the middle of August will do; but if the land is not perfectly clean, let the sowing be put off till the spring, and without a crop of Corn. It is fit to cut for a first crop of Hay generally from the 20th to the 28th of May, the year after sowing (this year it was a fortnight earlier), and for a second crop when it comes into blossom; it takes a longer time making into Hay than Grass, as it is better only turned, not shaken out, otherwise much leaf is lost. The crop must be well manured every year in January, February, or beginning of March, and the ground between the drills kept perfectly free from weeds by hoeing in dry weather, and picking the Grass out of the drills where the hoe would cut off many of the plants. The grand secret in growing Lucerne, I am persuaded, is in keeping it clean, and, when kept so, no green crop can bear any comparison in value; it is very far superior to Tares. I have now a third crop fit to cut, 26 inches high, on the same ground I cut for Hay only five weeks since. No lime must be used for manure. I am inclined to think guano mixed with farm-yard manure would answer well. If the quantity to be laid down be more than one acre, the plough and drill must be used, in which case it should be put in not more than two inches deep.—*Correspondent of Mark Lane Express.*

Burning Clay.—"Let sods be cut of a convenient size to handle—say a foot wide and 18 inches in length; with these form a parallelogram, or 'long square;' let the walls be a couple of feet thick, and trampled or beaten firmly together, and raised at least three feet high; the kiln should be so situated that the wind may blow against one of its sides; the kiln may be from four to six yards long by three yards wide, and an aperture, within one yard of each end, and others at a distance of about five feet from these, should be left in the side walls, when building, for the purpose of forming drain-like openings across the kiln; make one of these drain-like openings from end to end in the length of the kiln; these funnels

are to be built also with sods; some dry turf, such as is used for fuel, is to be put into these funnels, and over it and between the funnels well dried sods, or any other combustible materials are to be laid on to the depth of a couple of feet over these sods, partially dried, to the level of the walls of the kiln; these materials being set on fire, a powerful heat will be produced, quite capable of burning clay, without previously drying it; care, however, will be necessary, to avoid throwing it on in too great a quantity at once, until the fire is well up, when a large quantity may be thrown on. The sod walls are to be raised as the heap rises, and as soon as it is perceived by the strength of the smoke and the glow of heat that the mass is ignited in all its parts, the apertures may be closed up, and the kiln left to become charred; should appearances indicate a likelihood of being smothered, it will only be necessary to open one or more of the funnels to secure its acting. If the land on which the burned or charred clay is to be applied be deficient in calcareous matter, earth containing it, if burned, would improve it much. Excellent crops of Turnips are produced on indifferent land by the use of the clay ashes; and there can be scarcely a better preparation for Rape. There is no process in agriculture that demands the farmer's closer attention and personal superintendence, than burning clay; for if well done, there is no improvement so cheap, and at the same time so valuable; if on the other hand the burning is hurried, or the fires neglected, the consequence will be, either the clay will be burned into lumps like brick ends, that will not fall to pieces when exposed to the air, or the clay will not be charred, or burned at all; therefore the heat should always be slow and steady, never, if possible, burning the clay red, but black—although this is difficult to manage, depending much upon the wind, stopping up the apertures on the windward side, when the wind blows fresh, and opening the opposite aperture, and particularly attending to this. The whole time the heaps are burning will take from two to three months, the time depending much on the weather; from 60 to 100 yards may be burned in a heap; and if there be not sufficient sod, coarse turf, bushes, &c., on the spot to keep up a sufficient body of fire at the commencement, wood of any kind, or small coal must be used."—*Third Report of the Monmouth Farmers' Club.*

Naturalisation of the Alpaca in Scotland.—The Alpacas arrived the latter end of August. When the weather became cold, and the nights were getting long, a wooden shed was erected for them in the park. At first they hardly ever went into it; but when winter commenced, I made the keeper (whom they follow like a dog) put up a small rack in their shed, in which was placed some Rye-grass Hay. The weather was fine, and they ate very little of it; but by and by, as winter advanced, they relished it better. I then ordered them to get a few yellow Turnips, which at first they seemed to like, but, tiring of them, I desired a little corn to be given, which they partook of pretty freely; but one day the keeper told me they would not eat their corn, especially when the day was good. Having some excellent Beans, I ordered the man to try them with a few. No sooner did the Alpacas hear the Beans rattling in the dish than they showed an eager desire to have them, and during several months, preferred them to every other sort of grain; indeed, so much so, that upon some Oats being intermixed with the Beans, the latter were picked out and the former neglected. What is extremely satisfactory is the hardiness of these animals compared to our sheep, and their indefatigable perseverance in searching for food, when sheep would to a certainty starve. I may state that this winter, 1843-4, has proved a most severe one. The park in which the Alpaca and sheep were confined, was covered for nearly three weeks with snow; and during that time there was not a vestige of herbage to be seen, with the exception of some little green tufts under the trees. The sheep required to be regularly fed with Turnips and Hay. Not so the Alpacas; they were seen in the most stormy days under the trees for hours, constantly eating the Grass, and never minding either the cold or snow. They have never had a day's illness, have never attempted to leap a fence, and are far easier to keep within an inclosure than the common sheep.—*Mr. Stirling, in the Transactions of the Highland Society.*

Notices to Correspondents.

ANALYSIS OF ONION, &c.—*J. Jackson.*—We know of none which gives the mineral component parts, which is almost the only useful part of an analysis to the farmer or gardener.

BOOKS.—*R. W. L.*—"The Farmer—Knight's Guide to Trade;" "Essay on the Improvement of Small Farms," by W. Blake, Esq.; Martin Doyle's "Flower Garden." There neither is, nor can be, any general work on Gardening, of such a price as you mention. Apply to the booksellers: we do not give prices.

CABBAGES.—*Subscriber.*—Sow Early York and Imperial in seed-beds now, to transplant before winter and to be ripe in May. Sow the Drum-head Cabbage in March for consumption about August. The first are small early varieties; the last is a large Cabbage.

FEAT IN PLOUGHING.—*M. Saul.*—Thank you for your account received some weeks ago. It was not thought of sufficient *general* interest for insertion.

GAS-LIME.—*F. C.*—You had better mix your pond and ditch mud with *gas* lime, turning it frequently before applying to the land; this you can do before Wheat-sowing; get old gas-lime if you can.

GRASS.—*Peel.*—Your Grass is a Lolium, or Rye-Grass, the seed of which may be usefully saved.

GREEN MANURE.—*E. B.*—The practice of ploughing green crops in as manure can rarely be characterised as economical. If your land require manuring for Wheat—if it be a stiff soil, you should have sown Vetches and eaten them off by sheep on the land. Sow one and a half bushel of Buck Wheat, broadcast, on a light soil, in the middle of May. Sow Lupines as you would Peas—plough them down when in flower. Mustard should be sown in May, 4 or 5 lbs. per acre, in rows—say 12 inches apart—or broadcast, and ploughed in just before flowering.

GUANO, &c.—*Peel.*—This manure, especially the African, is frequentlydelivered very damp; whether naturally or artificially so, is another question. We have known it to contain 20 per cent. of water. The value of marl depends altogether upon its composition, and frequently upon some of its smallest ingredients (see Sprengel on the subject in late Nos. of this Paper). The proper way to apply it is before winter, as fine as possible; when spring comes it is in a state to be spread evenly and buried. It may form a useful ingredient in a compost, especially if ultimately used on a light soil. Thanks for your paper on Rooks.—*J. C.* asks if any of our correspondents will favour him with their experience of African, Peruvian, and Bolivian guanos, also of rapedust and soaper's ashes, as manures? With reference to the last, see Sprengel in this and next Papers.

INSECTS.—*A. B.*—I am glad you sent the insects, for they are one of the best friends you have, being the larvæ of the Lady-birds, which feed entirely upon the plant-lice that are infesting your Swedes. *Vide* the "Royal Agricultural Journal," Vol. iii. p. 56, and pl. c. f. 13-17.—*J. W. L.*—Your Turnip-leaves are covered with Aphides, and the larger insects accused of cutting off the heads of the young Turnips are the larvæ of the Lady-birds, as you imagined, which live entirely on plant-lice, and must not be destroyed. We will make this the subject of a paper as soon as possible. *R.*—*A Leicestershire Farmer.*—The flies you sent are the Aphis rapæ, whose history you will find in the "Royal Agricultural Journal," Vol. iii, p. 53.—*A Subscriber, Waterford.*—Your last supply enables us to state that your Turnips are suffering from the Aphides, a vast portion of which are punctured by parasitic flies. You will be interested with the history of these insects given in the "Royal Agricultural Journal," vol. iii. p. 49. *R.*

LINSEED AS FOOD.—*J. C.*—We had hoped to have been able, before this, to have published on this subject. We shall do so shortly. Wheat straw, *ad. lib.*, cut into chaff and steamed with 2 or 3 lbs. of Barley meal a day, would probably answer your purpose, though in this we do not speak from experience.

LUCERNE.—*Subscriber.*—Sow 12 lbs. of seed in rows about 1 foot apart, on well and deeply-tilled ground, before the middle of April. You will be able to cut it once in the autumn of that year, and four or five times next year. (See *Miscellaneous*, No. 32 *Agricultural Gazette.*

MANURE.—*G.*—If the analysis you give is correct, lime will benefit your soil; you may safely put 150 to 200 bushels per acre on it. As to the probability of muriate of soda benefiting you, this will be better indicated by your distance from the seashore, than by your analysis, which does not enter sufficiently into detail. If you are inland, apply common salt, 1 cwt. per acre.

PEAS.—*Subscriber.*—The Nimble Pea and the Early Warwick, are early Peas, much in favour with market-gardeners.

REARING CALVES, &c.—*W. C.*—The following is the way in which the best Gloucestershire dairy-farmers manage:—The calf is removed from the cow at six or eight days old, provided the dam be a cow and not a heifer; if a heifer, the calf is allowed to remain about a fortnight, because a heifer is more difficult to be milked, and the calf assists the milker. No difference is made whether the calf be heifer, steer, or bull; they are all reared exactly in the same way. At about a week old calves are allowed each two quarts of best milk twice per day: this is everything given till about two months old, except Hay, which they generally eat well at a very early age—say three weeks. After two months old they consume a good quantity of Hay, and then we reduce the two quarts of milk to one, and add two quarts of water, which makes a mixture of three quarts, as of course they require more to drink, as they consume more Hay. At about ten weeks old they are turned to Grass, and all the milk is discontinued by degrees. The longer a calf remains with its mother the more will it feel the loss when taken away. The age of sixteen months is the correct time to put the heifer to the bull, so that she may calve at two years old, or thereabouts. This, undoubtedly is the best time for a dairy; but, should the chief object be symmetry and size, without much regard as to profit, by allowing them to remain until three years old before they calve, you gain your object. No difference is made in selecting calves, whether they are from heifers or cows; a heifer's first calf is equally good with the second. The objection to weaning the first calf generally arises from the heifer calving later in the season than cows, which is generally the case. It is not at all desirable that the heifer should suckle her first calf, except for the limited period before mentioned. The heifer should be made quiet for milking as soon as possible, which object is defeated by allowing the calf to suck.—*E. H.*

REARING YOUNG CATTLE.—*A Teifi-side Subscriber.*—See answer to similar question above. Also see Paper on this subject in No. 1, *Agricultural Gazette*, by Mr. Wilson, extracted from "Quarterly Journal of Agriculture."

SKINLESS OAT.—*Paddy.*—We do not know if the skinless Oat, introduced some years ago from China, is the same as that found in County Galway and other parts of Ireland.

VETCHES AND ITALIAN RYE-GRASS.—*A. Huxtable.*—We doubt the propriety of sowing the two together. In the only case in which we have done so on a large scale, the Rye-Grass had perished before the Vetches were cut.

WEED.—*R. T. C. J.*—Your weed is, apparently, some species of Lolium or Rye-Grass. The proper remedy is to take two fallow crops in succession—say Potato and Swedes, and clean the land well in both cases before taking a grain crop.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, Aug. 5.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	8	to 4s	0	Best Downs & Half-breds	3s	8 to 4s 0
Best Short Horns	3	6		3 10	Best Long-wools	3	6 3 10
Second quality Beasts	3	0		3 6	Ewes and second quality	3	2 3 6
Calves				3 8	4 4 Lambs	4	0 4 8
Pigs				3 4	4 0		

Beasts, 3302; Sheep and Lambs, 33,970; Calves, 197; Pigs, 810.

Our supply of Beef to-day is very large, but a great many of them are of very inferior quality; some of the best Scots, &c., are still making 4s, but this price for anything is more difficult to be obtained than on last Monday; and 3s 10d is quite an extreme price for the best Short-horns. Second quality Beasts are a very heavy sale, a great many making very little over 3s per 8 lbs; several of this description remain unsold. The supply of Mutton, although considerably shorter than on last Monday, is still adequate to the demand, which rules heavy, and the advance in prices which was obtained on Friday is not supported to-day. The Lamb-trade is declining very fast—a great many of the larger sort only make Mutton price; in some few instances 4s 8d is obtained for very nice quality, but this is a rare price. Veal is rather lower than on Friday—a very nice Calf is, however, still worth 4s 4d. Pork is about the same.

FRIDAY, Aug. 9.

The supply of fresh Beasts to-day is not very great, but with what were left over from Monday, there are too many for the demand. Trade is very heavy, at barely Monday's prices—indeed, we cannot quote the best Scots, &c., at more than 3s 10d, and Short-horns 3s 8d per 8 lbs. Mutton-trade is very heavy at hardly so good price as on Monday, but scarcely a quotable difference. Lamb is going out, and for the most part is making very little more than Mutton; prices range from 4s to 4s 6d. Veal is a little lower, it being difficult to make 4s 4d of the very best; many very good Calves are sold at very little over 4s per 8 lbs. Pork, 3s 4d to 4s.

Beasts, 782; Sheep and Lambs, 11,240; Calves, 336; Pigs, 290.

41, West Smithfield.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, Aug. 8.

Prime Upland Hay	95s to 105s	Clover	100s to 115s	Straw	25s to 28s
Inferior ,,	— —	,, New	— —		
New Hay ,,	80 90

CUMBERLAND MARKET, Aug. 8.

Superior Old Hay	100s to 110s	Superior Clover	114s to 120s	Straw	28s to 38s
Inferior	90 96	Inferior ,,	100 110		
New Hay	90 100	New Clover	95 108		

JOSHUA BAKER, Hay Salesman.

WHITECHAPEL, Aug. 9.

Fine Old Hay	90s to 98s	Old Clover	126s 130s	Straw	24s to 30
New Hay	75 88	New Clover	95 110		

COVENT GARDEN, AUG. 10.—The late fine weather has caused a good supply of orchard fruit to be brought into the market. The quantity of Vegetables, generally speaking, is also amply sufficient to meet the demand. Pine-apples are very plentiful; among them we noticed some fine specimens of Providences and Queens; they are not altered in price since our last report. Large quantities of the foreign Pines formerly alluded to are in the market, and, although still much inferior to English-grown varieties, they are somewhat improved in quality; they bring from 1s. to 5s. each. Black Hamburgh and Muscat Grapes, of good quality, are abundant. Foreign Melons continue to be pretty well supplied, but those of home growth are becoming less numerous. Peaches and Nectarines are sufficient for the demand; a few from the open walls have been supplied during the week. Apricots, Green Gages, and several kinds of Plum are now offered in considerable quantities. Cherries are becoming scarce, and Gooseberries and Currants are also less plentiful. Apples chiefly consist of the Juneating, Red Astrachan, and Hawthorndean. Among Pears Jargonelles are most prevalent. Filberts have just made their appearance. A few Strawberries are still to be met with. Of Vegetables the supply of Peas is becoming somewhat limited, and they are considerably advanced in price. Artichokes are good. A few Tomatoes have been offered at about 1s. 6d. per punnet. The best Mushrooms are selling at about 2s. per pottle. Cabbages are good and plentiful. Cauliflowers, although still sufficient for the demand, are getting scarcer. Carrots are good and plentiful; but Turnips are very scarce. Salading and Herbs of every kind are abundant. Cut Flowers chiefly consist of Bignonia venusta, Ceanothus azureus, Alstrœmeria pelegrina, Fuchsias, Heaths, Pelargoniums, Carnations, Picotees, Verbenas, Gardenias, and Roses.

FRUITS.

Pine Apple, per lb.,	4s to 6s	Plums, per half-sieve,	1s 6d to 5s
Hothouse Grapes, per lb.,	2s to 6s	Strawberries, per gallon,	1s 6d to 2s
Melons, each,	2s to 5s	Gooseberries, per hf.-sieve,	1s 6d to 4s
Peaches, per dozen,	5s to 10s	Walnuts, pickl., per bsh.,	4s 6d to 5s 6d
Apples, Dess., per bush.,	2s 6d to 4s 6d	Oranges, per dozen,	1s to 2s

JAMES PERRIN, Wool Broker.

HOPS, FRIDAY, Aug. 9.

The accounts from the plantations have continued to come worse daily during the week; the duty has fallen to 130,000*l*, and prices have advanced 8s to 10s per cwt.

PATTENDEN & SMITH, Hop-Factors.

MARK-LANE, MONDAY, Aug. 5.

WITH a short supply of Wheat from Essex, Kent, and Suffolk, the market was rather better than on Monday last, and fully equal to Friday; but there is no inclination to pay any advance. In Foreign there was a fair retail sale for consumption, and its value may be considered the same as last week.—Flour has declined 3s. per sack.—Barley, both English and Foreign, is 1s. lower, and Peas have receded 1s. to 2s. per qr.—In Beans there is no alteration.—Oats are a very slow sale at late rates.

BRITISH, PER IMPERIAL QUARTER.	s.	s.		s.	s.

—— Pigeon, Heligoland . 33 to 35 Winds.	—	—	Longpod	—	—
Peas, White . . . . 32 to 36 Maple	28	32	Grey	21	29

FRIDAY, Aug. 9.

The weather has continued unsettled from Monday last, but we have had scarcely any rain since Wednesday; on that day there was a fair demand for Foreign Wheat, which in some instances brought an advance of fully 1s. per qr., but to-day there is less doing; Factors, nevertheless, are unwilling to accept the rates of our last quotations. We have had but little English fresh up during the week, and observe no alteration in its value.—Barley remains as last quoted, but grinding qualities are rather more inquired after.—Beans and Peas are unaltered. Oats are more in demand, at 6*d.* advance.

TO FLORISTS AND ADMIRERS OF FLOWERS.

BRAIN'S CONCENTRATED LIQUID GUANO, for the Garden, Shrubbery, Hothouse, and Conservatory.

This preparation is peculiarly adapted for the development of Flowers, furnishing them with the materials (in a soluble form) out of which they weave their delicate tissues and elaborate their beauteous colouring. It has no unpleasant smell, is easily applied, and thus recommends itself, either for the Garden or Drawing-room.—Price 1*s.* 9*d.* per quart Bottle, and may be had of most respectable Druggists and Seedsmen, with full directions for use inclosed.—Works, Thomas-st., Stamford-st., Blackfriars-road.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, Aug. 8, 1844:—

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London

---

GYPSUM, &c.—Pure Gypsum (Sulphate of Lime) for Compost Heaps, Urine Tanks, Stables, &c.; also Sulphuric Acid, Guano (foreign and Potter's), Rape Cake and Rape Dust, and all other Manures, may be had of the Undersigned.

Synopsis of Prices, and mode of use, on application.

MARK FOTHERGILL, 40, Upper Thames-street.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 12*s.* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay-making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil-Cake Crushers	Threshing Machines for the
Double action Turnip-cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch Street, London.

DRAINING OF LAND.

THE A LEVEL, designed for the Use of Workmen, in preserving a uniform fall in Drains and Water-courses. In consequence of the approval expressed and the demand made for these Levels at the recent Southampton Show, Mr. BAILEY DENTON has arranged with an eminent London Mathematical Instrument Maker to make them in any number required. Price 30*s.*

This Level is as accurate as a spirit-level, and so simple, that the workman unable to read can use it with facility. When closed it forms a 5 feet staff.

Orders addressed to Mr. DENTON, Land Agent, 9, Gray's Inn-square, will insure a perfect instrument.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

ASPHALTE.—BROWN OIL VARNISH, BLACK VARNISH PAINT.—Asphalte in a pure state, without grit, 5*s.* per cwt., in casks 2 cwt. each, for forming or improving garden walks, terraces, court yards, stables, ground-floors, roofs, or for applying to damp walls. Brown Oil Varnish for varnishing gates, outhouses, fences, &c., 8*d.* per gallon—it dries very quick. Black Varnish Paint for outhouses, fences, &c., 8*d.* per gallon.—R. RICHARDSON, Net and Tent maker, 21, Tonbridge-place, corner of Judd-street, New Road, London.—Pitch 5*s.* per cwt. Stockholm Tar, &c.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

TANNER'S VITREOUS FLUID and CLOTH, a Substitute for Glass for Horticultural Purposes.—The Vitreous Cloth proves its superiority over Glass, by producing the light most suitable to vegetation, superseding the necessity of any shading, preserving a healthy moisture on the plant, retaining its bloom to a more lengthened period, less expensive, and not requiring so much attention. The above (retaining heat) is preferable to Glass for Hothouses, &c., the temperature of which is maintained with less fuel. It is equally applicable as a covering for Fruit-trees, preserving them from frost, blight, and excessive heat. The Vitreous Cloth, made by machinery, is much superior to any prepared in a different manner. By the use of the Vitreous fluid, the Cloth (after lengthened service) may be renewed.

The Fluid sold in bottles 2*s.* 6*d.* and 4*s.* 6*d.* The Cloth 2*s.* 6*d.* and 3*s.* per yard. Manufactured by N. W. TANNER, Chemist, Exeter. Agents for Exeter and vicinity, Messrs. LUCOMBE, PINCE, & Co., Exeter Nursery. Liverpool: Mr. CUNNINGHAM, Nurseryman, Paradise-street.

N.B. The Vitreous Cloth (if fixed in the manner recommended by the Proprietor) will stand *a much greater pressure* of air than glass.

To Mr. N. W. Tanner—Sir, we have used your prepared Cloth, and have pleasure in informing you that whilst the light admitted through it is very suitable to vegetation, there has been no necessity to have recourse to any extra shading during the very clear, bright weather which we have so long experienced; this we consider an important point. Yours, &c.

(Signed) LUCOMBE, PINCE, & Co., Exeter Nursery.
June 21, 1844. *** Respectable Agents required.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

EXTRACT FROM OLD MOORE'S ALMANAC for 1844.—"AUGUST.—CARE OF HEALTH.—This is generally the hottest month in the year; languor and inability for active mental and bodily exertion is experienced by all, but more especially by ladies and those of delicate constitution. Recourse should be had to that excellent medicine, Parr's Life Pills, which will quite re-invigorate the whole system, and render the heat of this month, which is otherwise so oppressive, as delightful as any month in the year."

PARR'S LIFE PILLS are sold by all respectable Medicine Venders.

See the words "PARR'S LIFE PILLS," in White Letters on a Red Ground on the Government Stamp.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Galley Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5*s.*, 10*s.*, 20*s.*, 50*s.*, and 100*s.* each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1*l.* to 5*l.* per annum; mansions and estates from 10*l.* and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

GARDEN NETS, FISHING NETS, RABBIT NETS, SHEEP NETS, &c.—New Garden Net, 1 inch mesh, 1½*d.* per yard; ½ inch mesh, 2½*d.* per yard. Old Fishing Nets, mended up, ¾*d.* per yard. Fine-mesh Net, to effectually exclude wasps and flies, and allow sufficient sun and air to the Fruit, 7½*d.* per yard. Much-approved Fishing Nets, viz—Flue Nets, of silk and thread; Drag Nets; Casting Nets; Hoop Nets; and all kinds of Nets for Sea, River, and Pool Fishing. Rabbit Nets, on cords from 50 to 100 yards long each. Net for fencing out Rabbits, 2*d.* per yard. Net to inclose Fowls and Pheasants, 2*d.* per yard. Sheep Nets, made of strong cord, 4½*d.* per yard; nearly 4 feet high. Nets of all kinds made to order.—ROBERT RICHARDSON, Net and Tent Maker, No. 21, Tonbridge Place, New Road, corner of Judd-street, London.

TARPAULIN CAPES, COATS, and WAGGON-COVERS.—Above 2000 London Policemen's Capes, for Gardeners, Labourers, and Farm-servants, lined, 2*s.* and 2*s.* 6*d.* each; large Tarpaulin Capes, for Gamekeepers and Watchers, 7*s.* each; Do., rather smaller, 6*s.*; Tarpaulin Coats, 8*s.* 6*d.* each: Waggon and Cart-covers of Tarpaulin, 2*s* 3*d.* per square yard; Hay Cart-covers; Patent India-rubber Tarpaulin Waggon and Cart covers, 3*s.* per square yard; several hundred Tarpaulin Frame-covers, second-hand, but perfect, quite the size of the largest mats, 3*s.* 6*d.* each, will last several years, and keep in twice the heat of mats; new Tarpaulin do., 5*s.* each; Tarpaulin Pit and Frame covers, Coach and Dog-cart Aprons, Horses' Loin Cloths; Woollen Horse Clothing and Blankets, largest and heaviest made, 12*s.*; Do., same size, lighter, 10*s.*, made to order any pattern.—ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, corner of Judd-street, New Road, London. Tents, Marquees, and Tarpaulins on hire. Roofing Canvas, 1¼*d.* per foot.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, LAMBETH POTTERY, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed

---

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

FIDDLE and PRINCE ALBERT'S PATTERN PLATE.—A. B. SAVORY and SONS, Manufacturing Silversmiths, No. 14, Cornhill, opposite the Bank of England.—The best wrought SILVER SPOONS and FORKS, fiddle-pattern, 7*s.* 2*d.* per ounce; the Prince Albert's pattern, 7*s.* 6*d.* per ounce. The articles may be had, lighter or heavier, at the same price per ounce:—

INTERESTING TO LADIES. — To MESSRS. ROWLAND & SON, 20, Hatton Garden, London.—"Percy Place, Landport, Portsmouth, April 4, 1844. GENTLEMEN,—I think it but an act of justice to inform you of the benefit I have derived from the use of your admirable Macassar Oil. About six months ago I found my hair getting daily more weak and thin, and much discoloured from a practice I had adopted of wetting it continually; fearing that I should lose it entirely, and hearing of the efficacy of your Macassar Oil, I have for some time past constantly used it, and the result is, that my hair is now perfectly restored and much improved in appearance and colour, having become thick, dark and glossy; it also curls freely without the use of paper, which it never did before. To all my friends I have warmly recommended your Macassar Oil as an excellent restorative and preservative for the Hair. As I have an objection to see my name in print, I beg you will not publish it; but you are at liberty to show this letter, or make any other use you please of it, and refer applicants to me if necessary, in proof of the efficacy of your Macassar Oil. Your Obt. Servant *"

ROWLAND'S MACASSAR OIL preserves and reproduces the Hair; prevents it from falling off or turning Gray; changes Gray Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

*** Ask for "ROWLAND'S MACASSAR OIL." All others are Fraudulent Counterfeits.

REALLY WATERPROOF.

BERDOE'S SUPERIOR WATERPROOF FROCKS, SHOOTING-JACKETS, GARMENTS for the SEA-SIDE, &c.—An extensive variety of the above, in NEW and greatly improved materials always ready, guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid the disappointment and vexation consequent upon purchasing articles made by slopsellers, and sold by parties not Tailors.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

MR. HOARE'S NEW WORK ON THE VINE.
This Day is published, 12mo. 5s. cloth,
A DESCRIPTIVE ACCOUNT OF A NEW METHOD of PLANTING and MANAGING the ROOTS of GRAPE VINES. By CLEMENT HOARE, Author of "A Treatise on the Cultivation of the Grape Vine on Open Walls."
London: LONGMAN, BROWN, GREEN, and LONGMANS.

IMPORTANT AGRICULTURAL WORKS, published by JAMES RIDGWAY, Piccadilly; and to be had of all Country Booksellers in every Market Town.

1. PERUVIAN AND BOLIVIAN GUANO, with Practical Instructions for its use, and testimonials of its results, price 1s.

2. A Fourth Edition, enlarged, of MORTON on SOILS and the RENT and PROFITS of AGRICULTURE. Price 10s.

3. On MANURES, by CUTHBERT W. JOHNSON, Esq., F.R.S.; a New Edition greatly enlarged. Price 16s., bound in cloth.

4. SINCLAIR on GRASSES and the WEEDS of AGRICULTURE. A New Edition, with numerous coloured Plates. 30s. cloth.

5. JOHNSON'S TRACTS for AGRICULTURAL SCHOOLS. Price 1s. each:—
THE COTTAGE-FARMER'S ASSISTANT—CALENDAR for YOUNG FARMERS—and AGRICULTURAL CHEMISTRY for YOUNG FARMERS.

In the Press, VON THAER'S PRINCIPLES of AGRICULTURE. Translated by W. SHAW, Esq., in 2 vols. Price 25s. cloth.

CONTENTS of the NUMBER for SATURDAY last, AUGUST 3, OF
THE ATHENÆUM,
JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND THE FINE ARTS.
Twenty-four Large Quarto Pages, PRICE FOURPENCE,
Or Stamped, to go free by post, 5d.
Reviews OF, WITH EXTRACTS FROM—
Richard the Third as Duke of Gloster and King of England, by Caroline A. Halsted
One-and-twenty Sheets from Switzerland, edited by George Herwegh (Einundzwanzig)
Historic Fancies, by the Hon. G. Sydney Smythe, M.P.
The Antigone, as acted
Poems, by Mrs. Butler
What does Hamlet mean? By T. Wade
WITH SHORTER NOTICES OF THE FOLLOWING:—
Evenings of a Working Man, by John Overs, with a Preface by Charles Dickens, Esq.
Art of Land Surveying, by Mr. Quested
The Seven Penitential Psalms in Verse, by Mr. Montague
Historical Essay, on the Early Progress of Life Contingencies, by Mr. Farren
A Course of English Reading, by the Rev. J. Pycroft
Thoughts on Habit and Discipline
Our Weekly Gossip.—Conclusion of the Stoddart and Conolly expedition—New Exeter 'Change—Committee on Decoration Art—Xanthian Marbles—Southey's Monument at Bristol—Mr. Landor's Letter—Mr. Bailey's Statue of the Duke of Sussex—Westminster Bridge—College of Chemistry—Mr. Webster and the Haymarket Theatre—Austrian Intolerance—French Illuminations.
Societies.—ASIATIC: Professor Royle on the Hyssop of Scripture.
Fine Arts.—Mr. Galley Knight's Mediæval Architecture of Italy—Mrs. Jameson's Companion to the Private Picture Galleries of Art.
Music and the Drama.—Her Majesty's Theatre — Sadler's Wells.
Miscellanea.—Mr. George Stephenson—Civil List Pensions—Market Weston Church.
Order The Athenæum of any Bookseller or Newsman.

Price Sixpence, free by post.
The Railway Chronicle
Of SATURDAY last, AUGUST 3, contains
PAST, PRESENT, and FUTURE—SIXTH REPORT of the SELECT COMMITTEE—VALUE of NEW and OLD MIDLAND STOCK—A RAILWAY SECRETARY and a CONTRACTOR DIRECTOR.
REPORTS OF MEETINGS—Grand Junction, with Report of the Directors—Chester and Birkenhead, with Report of the Directors—Manchester, Bolton, and Bury, with Report of the Directors—Midland Railway, Accounts of the Amalgamated Lines—London and York Railway—Eastern Union, with Report of Directors—Portsmouth and Chichester—Churnet Valley—North British—Hereford and Gloucester—Preston and Wyre Branch to Blackpool—Whitehaven, Workington, and Cockermouth—Dublin and Cashel.
FRENCH CHAMBERS, Proceedings in.
PARLIAMENTARY AND LEGAL PROCEEDINGS.
VALUE OF SHARES—Returns from London, Liverpool, Manchester, Leeds, York, Hull, Glasgow, and Paris, with comments on the respective Markets.
NEW SKETCHES OF OLD RAILWAYS—London and South Western.
RECORDS OF RAILWAY PRACTICE—Accommodation Bridge *(with an Engraving.)*
CORRESPONDENCE—Wooden Railways, by Mr. Bridges—Holden's Carriage Lamp *(with Engraving)*—Comparative Cost of Passenger Conveyance—Terms of Croydon and Greenwich Arrangement.

CONTRACTS, CALLS, DIVIDENDS, TRAFFIC TABLES, &c., &c.
Order The Railway Chronicle of any Newsvender.

Just published, the Thirteenth Edition, price 2s. 6d.; free by post, 3s. 6d.,
THE SILENT FRIEND on NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho; Wilson, 338, Oxford-st. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11s. and 33s. PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2s. 9d., 4s. 6d., and 11s., by all Medicine Venders.
Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

PRINTED FOR
TAYLOR AND WALTON,
BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,
UPPER GOWER-STREET.

DARLEY'S
SCIENTIFIC LIBRARY.
FOR THE USE OF
SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.
A NEW EDITION (being the fifth) *is now ready*,
A SYSTEM
OF
POPULAR GEOMETRY;
Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.
BY GEORGE DARLEY, A.B.
Price 4s. 6d., cloth.

II.
NEW EDITION (just published),
COMPANION
TO THE
POPULAR GEOMETRY;
In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.
BY GEORGE DARLEY, A.B.
Price 4s. 6d., cloth.

III.
THIRD EDITION,
A SYSTEM
OF
POPULAR ALGEBRA;
WITH
A Section on PROPORTIONS and PROGRESSIONS.
BY GEORGE DARLEY, A.B.
Price 4s. 6d.
"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."
—*Library of Useful Knowledge, article "Mechanics."*

IV.
SECOND EDITION,
A SYSTEM
OF
POPULAR TRIGONOMETRY,
Both Plane and Spherical.
With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.
BY GEORGE DARLEY, A.B.
Price 8s. 6d., cloth.

V.
FAMILIAR ASTRONOMY.
BY GEORGE DARLEY, A.B.
WITH ENGRAVINGS.—12mo, 5s., cloth lettered.
"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

KNIGHT'S WEEKLY VOLUME.
This day,
TALES FROM SHAKSPERE. By CHARLES LAMB and MISS LAMB. To which are now added, Scenes illustrating each Tale. Vol. II.
London: CHARLES KNIGHT & Co., 22, Ludgate-street.

NEW EDITION OF COL. HAWKER ON SHOOTING.
Published this day, 8vo., 21s., cloth, the NINTH EDITION of
INSTRUCTIONS to YOUNG SPORTSMEN in all that relates to GUNS and SHOOTING. By Lieut.-Col. P. HAWKER. Corrected, enlarged, and improved, with Eighty-five Plates and Woodcuts by Adlard and Branston, from Drawings by C. Varley, Dickes, &c.
"The very best book we have on the subject."—*Blackwood.*
"Colonel Hawker expounds the whole *rationale* of shooting with clearness, fulness, and vivacity."—*Edinb. Rev.*
London: LONGMAN, BROWN, GREEN, AND LONGMANS.

Published the 30th July, Second Edition, Demy 8vo, Price 2s.; if sent by Post, 2s. 6d.
EVIL!—REMARKS thereon by LUKE JAMES HANSARD;—being an ADDRESS to MAN for the BEST PROTECTION OF THE YOUNG,—seeking the Diminution and Cessation of Seduction and Prostitution, and having reference to The Bill, "Brothels Suppression," withdrawn (on the 9th July instant) on its being proposed for Third Reading in the House of Lords.
Printed and Published by James and Luke James Hansard, 6, Great Turnstile, Lincoln's-Inn Fields, London.

J. HAMILTON begs to inform all past and future Purchasers of his "TREATISE on the PINE-APPLE, &c." that on receiving a note, with address, and a stamp inclosed, he will answer any inquiries, also return a written document, purporting some improvement respecting turning out, &c. Price 6s.
Published by J. MASTERS, 33, Aldersgate-street, London; and may be had of T. WILD, 3, Tavern-street, Ipswich; or of the Author, Thornfield; and all other Booksellers.

Just published, price 1s. 6d.,
OBSERVATIONS on the CULTIVATION of ROSES in POTS, including Forcing, Propagation, &c., with a List of Varieties best suited for Pot Culture. By W. PAUL, of the Nurseries, Cheshunt, Herts.
SHERWOOD, GILBERT, and PIPER, Paternoster-row; or post free from the Author, Cheshunt, Herts, on the receipt of 22 postage stamps.

In 8vo, boards, with very numerous woodcuts, price 10s. 6d.,
LINDLEY'S ELEMENTS OF BOTANY:
STRUCTURAL, PHYSIOLOGICAL, SYSTEMATICAL, AND MEDICAL.
Being a Fourth Edition of the "Outline of the First Principles of Botany."
Contents of the Work—I. STRUCTURAL and PHYSIOLOGICAL BOTANY:—1, Elementary Organs; 2, Compound Organs; 3, Root; 4, Stem; 5, Leaf-buds; 6, Leaves; 7, Food and Secretions; 8, Flower-buds; 9, Inflorescence; 10, Floral Envelopes; 11, Male Organs; 12, Disk; 13, Female Organs; 14, Ovule; 15, Impregnation; 16, Fruit; 17, Seed; 18, Acrogens, or Flowerless Plants.
II. SYSTEMATICAL BOTANY:—1, Linnean Sexual System; 2, Analytical Method; 3, Natural System; 4, Natural System of De Candolle (*this Part illustrated with Numerous Figures of the details of the more important Natural Orders*); 5, the Alliances of Plants; 6, Sketch of a New Distribution of the Vegetable Kingdom.
III. MEDICAL BOTANY; consisting of a Classified List of the Principal Medical Plants that are known in a living state in Europe; with an Explanation of the Purposes to which they are applied Medicinally.
TAYLOR and WALTON, and all Booksellers.

VICTORIA LIFE ASSURANCE COMPANY.—

Trustees.

Sir Jas. Duke, Ald., M P., Chairman.

Benjamin Hawes, Esq., Deputy Chairman.

Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

JONES'S PHILOSOPHICAL REMEDY.—Quite a New Discovery for the immediate Relief and ultimate CURE of CORNS and BUNIONS. This remedy is peculiarly applicable to Corns between the Toes, and will immediately enable the greatest sufferer to walk with the most perfect ease and comfort. Sold by all Patent Medicine Venders, or sent free by post, on receipt of 15 postage stamps, addressed to Messrs. JONES and Co., Light House, 201, Strand.

News of the Week.

THE birth of another PRINCE of the House of Brunswick will, doubtless, excite a feeling of universal sympathy throughout the empire. It strengthens the stability of the Crown by providing another pledge for its continuance in the direct succession, and awakens the more homely sympathies of all classes of the people in the domestic character of their Sovereign. The auspicious event is both personally and politically a subject of congratulation, and we trust that the new-born Prince may contribute to the happiness of Her Majesty's private life and fulfil the expectations of her subjects, by worthily occupying the high station which he may hereafter be called upon to fill.—The proceedings of Parliament during the week, though mostly of a routine character, have presented several topics of interest. In the Lords on Monday, Lord Minto's motion on the state of the Navy was met by a declaration from Ministers that the country possesses overwhelming means of available defence in the event of a war, and that our dockyards are busily occupied in the building of additional vessels and in adding to the strength of our steam marine. In connection with this subject the Duke of Wellington adverted to the affair of Tahiti, but only to state that the "eccentricities" of the French authorities were acts for which they would be required to render an account. A great outrage, he said, had been committed, for which he had no doubt that satisfaction would be given, and he considered that this course was more desirable than that the British force at Tahiti should have brought on a collision at the time by attempting to prevent what had occurred. On Tuesday, on the motion for going into committee on the Poor-law Amendment Bill, the Bishop of Exeter moved an amendment that it be committed that day six months. The Duke of Wellington said that the object of the Bishop was to repeal the existing law which had been devised to correct the enormous mischiefs of the old system, and on a division the amendment was rejected by 17 to 1. On Thursday Lord Normanby brought the Tahiti question again before the House, and elicited an announcement from Lord Aberdeen that it made little difference whether or not Mr. Pritchard was recognised as British Consul at the time of his arrest, for as a British subject Government were bound to protect him. He thought, however, that a just, conciliatory, and moderate tone would prevent any disastrous results.—In the Commons on Monday the Bill to repeal the obsolete penal acts against the Roman Catholics was read a third time and passed, after a declaration from Sir R. Peel that in repealing such laws the Legislature was not so much conferring a favour on the Catholics as relieving its own statute-book from a disgrace. So far, he said, from being bulwarks of the Church, these laws were outworks which might be used by reason and ridicule against her; and if there were any law enforcing any penalties on Dissenters on account of conscientious objections, he would pledge himself to support its repeal. On Wednesday, Lord Palmerston raised a debate on the foreign policy of the Government. He designated their system as one of "resistance at home, and of unlimited concession abroad," and contended, in reference to Tahiti, that there should be no concession which would lead to the dishonour of the country. Sir R. Peel declined to enter into the Tahiti question, as it was still the subject of negotiation with France, but maintained that the name and honour of the British Government never stood higher than at this time. The business of the Session was virtually closed last night, when Sir R. Peel moved that the House, at its rising, adjourn to the 5th of September.

In France the questions of Tahiti and Morocco exclusively engage the attention of all classes. Accounts from the French residents at Tahiti have been received in Paris, which tend rather to strengthen the case of Mr. Pritchard, than to lessen the effect of the previous advices, and they announce the additional fact that the removal of that gentleman was the precursor of a general revolt of the natives against the French authorities. A collision had taken place, in which the French were manifestly the losers, and their position had become so perilous that their expulsion from the islands was not improbable. The French Chambers were closed on Monday by royal ordinance, but before they separated, the leading Members of both Chambers adverted with considerable warmth to the affairs of Tahiti, and to the demand of England for reparation. M. Guizot, however, declined to enter on a discussion, but assured the Chambers that throughout the negotiations he would defend the rights of the navy and uphold the honour of its officers.—The accounts from Morocco are so confused, that even the French naval and military commanders appear for some days to have been unable to understand its present position. The Emperor is evidently wavering and undecided; but the last accounts from Marshal Bugeaud state that he is willing to give satisfaction. The Prince de Joinville had removed the French consul from Tangiers and given a further delay of eight days, in ignorance of these advices from the Marshal, who appears to have previously suggested an immediate demonstration on the coast. It remains, therefore, to be seen whether the Emperor is sincere in his professions, and in the meantime it is not likely that any extreme measures will be adopted.

Home News.

HER MAJESTY'S ACCOUCHEMENT.—On Tuesday morning the Queen was safely delivered of a Prince, and we rejoice to add that both her Majesty and the infant Prince are doing perfectly well. Her Majesty was taken ill about 5 A.M., at which time the medical attendants were summoned. A special messenger was also despatched to the residence of Mr. Brown, surgeon to the Household at Windsor, to be in attendance at the Castle with Sir James Clark and Doctors Locock and Ferguson. On the previous evening, at 9 o'clock, a special messenger from the Lord Chancellor reached Windsor Castle with the commission which it was necessary for her Majesty to sign, in order that the Royal assent might be given on Tuesday to the various Bills which were only waiting that stage to become law. At 5 o'clock, her Majesty being sensible of her approaching accouchement, sent for the commission, and affixed the sign manual to the seven sheets of parchment of which it was composed, with all the boldness and firmness which usually characterise her Majesty's handwriting. At 10 minutes to 8 the young Prince was born. Shortly after 6 a messenger was despatched from the Castle, to the superintendent at the Slough station, with instructions to communicate, by means of the electro-magnetic telegraph, to the person in attendance at the telegraph office at Paddington, that the letters, which had been waiting there for several days past, addressed to the Cabinet Ministers and the great Officers of State, were to be delivered at the residences of the respective parties without a moment's delay. The messenger reached the Slough station within 8 minutes of his departure from the Castle, then 10 minutes past 6 o'clock, and within 3 minutes of the instructions reaching the Slough station, the telegraph was not only at work, but the communication was despatched to Paddington, and an acknowledgment of its receipt returned to Slough, and this was all effected within 11 minutes of the special messenger's departure from the Castle. The first special train which reached Slough from Paddington arrived at the station at 23 minutes past 8 o'clock, having performed the 18¼ miles in exactly 18 minutes, being at the rate of more than 60 miles an hour. In this train were the Duke of Buccleuch, Earl of Delawarr, Earl of Jersey, Lord Lyndhurst, and Sir James Graham. The second special train from Paddington, which brought down Sir R. Peel and Lord Stanley, reached Slough at 40 minutes past 8. The whole of the Ministers proceeded to the Castle at full speed, in the Royal carriages and four, which were in waiting at Slough. The Duke of Wellington arrived in a third special train, shortly afterwards, alone, performing the distance from Paddington to Slough in 17 minutes and a half. The Duke immediately proceeded to the Castle in a carriage and four, and reached there in 11 minutes after his arrival at the station, and within less than half an hour from the period of his leaving Paddington! The Earl of Liverpool and Lord Wharncliffe left town by the regular 9 o'clock train. The whole of the Cabinet Ministers and great officers of State, after remaining at the Castle upwards of an hour, and partaking of a *dejeûner*, left again for the Slough station shortly before 10 o'clock. Their journey, from Slough to the Paddington terminus, was performed by a special train, in 15 minutes and 10 seconds; being at the rate of upwards of seventy miles an hour. The Bishop of London reached Slough by the day mail train, which left Paddington at a quarter past 10, but upon alighting from the train at Slough, his lordship met the Ministers at the station, by whom he was informed that the auspicious event had taken place some three hours previously, and that Her Majesty and the Royal infant were doing well. The Bishop then returned to the metropolis without proceeding to Windsor, in company with the Ministers. The birth of the Prince was subsequently communicated to the public in the usual official form, by means of a Gazette Extraordinary, dated Windsor Castle, August 6, and stating that "this morning, at 10 minutes before 8, the Queen was happily delivered of a Prince. His Royal Highness Prince Albert, several Lords of Her Majesty's Most Hon. Privy Council, and the Ladies of Her Majesty's Bedchamber being present." It is clear, however, from the above account of the arrival of the Great Officers of State, that no Privy Councillor had arrived at Windsor when the Queen was brought to bed. Even the Duchess of Kent did not reach the Castle until after the birth of the Prince. The bulletin announcing the event to the inhabitants of Windsor was sent to the mayor, and posted at the Town-hall within half an hour after it had taken place. The bells of St. George and the parish church were instantly manned, and merry peals were rung for upwards of an hour. At ten o'clock a Royal salute was fired from the Corporation ordnance, in the Bachelor's Acre. A Royal salute was also fired from the Belvidere Battery, near Virginia Water; and in the evening the town was illuminated. Long before noon the intelligence of the Queen's accouchement was known all over the metropolis, and the usual demonstrations of loyalty were evinced in the several parishes in honour of the occasion, flags in abundance floating from the church-steeples, and their bells sending forth their peals during the day. The shipping in the river were dressed in their colours, and salutes were fired from all the public establishments on the river, and at Chatham and Sheerness. In the afternoon the Privy Council assembled at Whitehall, and it was ordered that a form of thanksgiving be prepared by the Archbishop of Canterbury, to be used in all churches and chapels on Sunday, the 11th August. The following is the bulletin issued yesterday by Her Majesty's physicians:—"The Queen has had another good night. Her Majesty and the infant Prince are doing well."

THE KING OF SAXONY.—His Majesty reached Inverness on Saturday on his return southward from Staffa and Iona, and took up his quarters at the Caledonian Hotel. At an early hour on Sunday morning his Majesty proceeded to Craig Phadric, to see the famous vitrified fort by which the hill is crowned. After his Majesty had attended mass at the Roman Catholic Chapel, he proceeded to visit Culloden-moor, the memorable spot where the Highland army, under Prince Charles Stuart, met with its final defeat. Thence the King went to Kilravoch Castle, and Cawdor Castle, the old feudal fortress of the Campbells of Cawdor. His Majesty left on Monday for Dunkeld, travelling by Kincraig, Bridge of Spey, Blair Atholl, and Dowally Kirle, to Dunkeld. The King was highly gratified with this part of the excursion, more especially with the wild scenery from Inverness to Blair Atholl. His Majesty remained the night at Dunkeld, having journeyed nearly 100 miles that day. On Tuesday morning the King inspected the beautiful grounds of Dunkeld Abbey, the seat of Lord Glenlyon, and the romantic scenery of that district. About midday the King left Dunkeld for Taymouth Castle, to visit the Marquess and Marchioness of Breadalbane. The route to Kenmore afforded his Majesty considerable pleasure—"the birks of Aberfeldy" being seen to advantage at this season of the year, and the beautiful falls of Moness were of course visited on the way. His Majesty was received with genuine Highland hospitality at Taymouth Castle. On Wednesday morning the King left Taymouth for Perth, and afterwards visited Stirling, Falkirk, and the palace at Linlithgow. On Thursday his Majesty arrived at Dalmahoy Castle on a visit to the Earl and Countess of Morton, and after an excursion to Hopetown House returned to Dalmahoy to dine. On Friday, the King visited Edinburgh, and inspected the Parliament House, Calton Hill, Holyrood Palace, and Arthur's seat, and then returned to Dalmahoy. His Majesty embarked on board Her Majesty's steamer Lightning on Sunday afternoon, and quitted our shores to return to his own dominions, *viâ* Hamburgh.

Arrival of Count Nesselrode.—This distinguished diplomatist, who has been daily expected for some time, arrived on Monday from Rotterdam. He was received on landing by Baron Brunnow and Chevalier Benkhausen, and took up his residence at the Russian Embassy. On Tuesday his Excellency visited the Earl of Aberdeen, Sir R. Peel, the Duke of Wellington, the Marquess of Clanricarde, and Lord Palmerston; and afterwards visited the Zoological Gardens. On Wednesday the Count drove round the environs of town, and afterwards visited successively the Pantheon, the Polytechnic Institution, the Chinese Exhibition, the Pantechnicon, and the House of Commons, and in the evening dined at the Travellers' Club. Count Nesselrode, as the Foreign Minister of Russia, has long held a very high rank among European diplomatists; and it is scarcely necessary to add, that Count Nesselrode, the Duke of Wellington, and Prince Metternich, are among the few remaining individuals who witnessed all the great events of 1813, 1814, and 1815. The principal object of the Count's visit to this country is to enjoy the benefit of sea-bathing; and it is reported that he will leave town for Brighton next week.

Parliamentary Movements.—Lord Villiers was returned for Cirencester on Friday without opposition, and has since taken his seat.—The election for Dudley has terminated in the return of Mr. Benbow, the Conservative candidate. The numbers were, for Mr. Benbow, 388; for Mr. Rawson, the League candidate, 175; majority, 213.

The Army.—Col. Dundas, who was deprived some

time since of the colonelcy of the 83d, and of his appointment as equerry to Her Majesty, in consequence of disrespectful language at a private dinner party, in reference to Her Majesty, has been recommended by the Duke of Wellington to the favourable consideration of the Queen, and has been restored by Her Majesty to active service.

Post Office Communications.—The arrangements made for extending the communications with India and China, alluded to by the Chancellor of the Exchequer on Friday, are understood to be as follows:—There is to be a communication with Bombay as at present. The Company's steamers are to leave Bombay on the 1st of every month, with mails, &c., for Suez, and Government is to provide steamers to convey them from Alexandria to Marseilles. This portion of the mails will arrive in London about the 3d or 4th of every month. Another line of communication is to be performed by the steamers of the Oriental Company under contract with the Admiralty. This line will leave Calcutta about the 10th of every month for Suez, calling at Madras and Point de Galle, in Ceylon, and will arrive at Suez in about 25 days after leaving Calcutta. From Suez the mails will be carried to Alexandria, where they will be embarked in the Oriental Company's steamers, Oriental and Great Liverpool, for Southampton, where they will arrive about the 21st of every month. There will thus be a communication twice a month with India, one *viâ* Bombay, and the other to Calcutta direct. With the Calcutta line a monthly communication with China is to be connected. A line of steamers is also to be provided by the Oriental Company to run between Ceylon and Hong-Kong, and to touch at Penang and Singapore. These will take from and deliver to the Calcutta steamers at Ceylon the China mails. By this arrangement the correspondence will be transmitted between London and Calcutta in 40 or 42 days, and between London and Hong-Kong in 48 days. The Calcutta service is to commence in January next. In connexion with this subject it may be mentioned that there is a report of a convention with Mehemet Ali for the safe transit of the mails being speedily settled.—An arrangement has just been made between Government and the Royal Steam-packet Company, by which mails and passengers will be conveyed on the 17th of this and each succeeding month *by steam-vessels throughout*, from Southampton to Santa Martha, Carthagena, Chagres, and St. Juan de Nicaragua. Five days will elapse between the arrival of the outward, and the departure of the homeward packet at Chagres, which will afford ample time for passengers proceeding to Europe to cross the Isthmus from Panama; and, as sailing packets ply regularly between that place and Callao, persons proceeding from Europe to Peru and Chili may now escape all the delay and danger of the voyage round Cape Horn, without being under the necessity of remaining a single day at Chagres.—The Belgian Government in connection with the Dover Company have made arrangements by which letters from all parts of Germany arrive in town 24 hours sooner than by the old arrangement. The London morning papers are now read in Brussels on the day of publication, and in a short time travellers will make the journey from London to Brussels in a single day with perfect ease. By the new convention between the British and Belgian Post-offices, the postage of letters between England and Belgium is reduced to 1*s.* for the whole distance, of which sum Belgium will take 5*d.* and England *7d.* This is a reduction of more than half of the present rate. The pre-payment will be optional. The journals, of whatever size, will be charged and continued.

Foreign.

FRANCE.—The affairs of Tahiti and Morocco occupy the Paris papers to the exclusion of all other topics. The Tahiti question is, however, that on which they bestow most attention, founding their observations on the correspondence of a republican paper of Toulon, on the intelligence published in the English papers last week, and on the debate which took place on Wednesday week in the House of Commons. This debate, and especially Sir R. Peel's unreserved announcement that reparation would be demanded, appears to have imparted fresh vivacity and violence to the articles of the papers of all parties. The *National* is, according to all appearances, not mistaken in affirming that throughout France there will not be two opinions on the affair, and that everywhere the conduct of the French authorities in the Society Islands will be unanimously applauded. The affair was noticed in the Chamber of Peers on Friday, when the Bill lately voted by the Deputies for granting an extraordinary credit of 8,000,000 francs to the Navy department came under discussion. The Marquis de Boissy expressed his regret that neither the Minister of Marine nor the Minister of Foreign Affairs were present to afford information respecting the "very serious event" which had taken place at Tahiti, and which had exasperated the "war party in England." Baron Charles Dupin, the reporter of the committee on the Bill, rose next, and elicited reiterated and universal applause whilst expressing himself as follows:—

"The Peer who has just addressed you has said a great deal about war. I am not one of those whom the prospect of an approaching war would very enormously alarm—we should certainly be able to carry it on. Intelligence arrived yesterday, from England, and it has been spread by our papers. Translations of official documents have been published. I fear not to say that those documents do not injure the honour of the officer so violently attacked beyond the Straits. Those documents prove that that officer is a man of spirit—a man who has conformed to the views of the Government. Being ordered to manage the administration of Tahiti, he has done his duty. He has encountered obstacles on the part of a man who has abused, not the character of an Ambassador, but that of a Consul, or, rather, a commercial agent, in order to foment intrigues, and kindle the hatred of the natives against France. I say that the Government of Tahiti could not hesitate to lay its hand on a man thus caught in the very act. Add to it, that the Governor has ordered a man, who had placed himself beyond the law, to be treated with respect, and that, after a brief detention, he has made him embark in an English vessel. I care little for the Parliament of England noticing this fact. There are, in the majority of both Houses of that Parliament, just men, who will acknowledge that the Governor of Tahiti was in the right. This is what I maintain to be the truth, and if the officer in question were accused in this hall, I should defend him, from whatever quarter the accusation might come."

On Saturday, on the reassembling of the Chamber, a large number of persons were attracted by the expectation of questions being put to the Minister of Foreign Affairs relative to the language held by Sir R. Peel as to the Tahiti affair. Soon after the commencement of the sitting, M. de Mareuil and M. de Boissy put the expected questions, and M. Guizot replied, that he would not do for M. de Boissy what he had denied the Prince de la Moskowa a day or two before.

"There are doors," said the Foreign Secretary, "which must not be opened every time they are knocked at; so long as the proper time shall not have arrived, I shall not enter into explanations calculated to injure the general interests of the country. I am of opinion that all the assertions put forth by newspapers ought not to be noticed at this tribune. When the facts shall be known and cleared up, I shall be ready to accept a debate on all that the Government may have done."

The Prince de la Moskowa said that, after what Sir R. Peel had stated in the House of Commons, he seconded most cordially M. de Boissy's question, and that there must be explanations afforded as to the course the Government intended to pursue. M. Guizot again declined giving any information. M. de Montalembert reminded the Chamber of the attacks made by the English press on the French navy and the Prince de Joinville, and complained of eminent men in the British Parliament re-echoing such attacks on France. Once more M. Guizot said that he could not consider as facts that which had just been asserted, and he engaged faithfully to report all that the Cabinet should do on so delicate a question. MM. de Boissy and de Mareuil then demanded that the questions be adjourned to Monday, which was rejected by a large majority. MM. Dubouchage, de Boissy, and de la Moskowa continued to insist that a reparation was due to the French naval officers who had been insulted. Count Molé rose also, and expressed his regret that the Cabinet, while observing a prudent reserve, did not afford some words of encouragement to the officers of the French navy.

"It has been said," he continued, "in full Parliament, that an agent of England had sustained a gross outrage, accompanied with indignity, and that a reparation would be necessary. Nobody can be surprised at the emotion which such words have excited among us. All who are as convinced as I am of the importance of maintaining a friendly intercourse between two great nations—all who consider such intercourse as the guarantee of the peace of the world—must be alarmed at the vehemence and promptitude of such language. I regret that the Minister of Foreign Affairs, whilst observing a forbearance which I respect, and a circumspection which is imposed upon him, should not think it possible to utter, on the eve of the closing of the Chambers, a few words which I deem indispensable in order to diminish an emotion and anxiety which he himself must consider well founded."

To this M. Guizot replied:—

"If I had thought that some words of mine would produce the effect Count Molé has just mentioned, I should not have waited until he demanded them. It is because I am convinced that, before we speak upon this question, it must be settled between the two Governments that I have hitherto been silent. Such is my sole motive. I am persuaded that if I consented to answer questions here, and said here what I am about to do elsewhere, instead of attaining the object you aim at, I should but increase resentments which I wish to appease. I have at heart, as much as any of you, the honour of our navy and the defence of the rights of our officers. I must and will uphold that honour and those rights, and it is precisely because I have at this moment to uphold them in another quarter that I cannot consent to a discussion in this House."

This answer met with general approbation; Count Molé exclaimed that he asked for nothing more, and the conversation then dropped.—The session of the Legislature for 1844 was closed by Royal ordinance on Monday. In the Chamber of Deputies M. de la Roche-jacquelin, having ascended the tribune, said that it was impossible the assembly could separate without replying to the insulting language used in Parliament by a Minister of Great Britain in speaking of the naval officers of France. He knew that the Cabinet was in a delicate position, but he thought that if it had acted with more firmness, England would not have dared to ask for reparation, when it was the French authority that had been so grossly insulted at Tahiti by the British Consul. M. Guizot, in reply, observed that the question at issue should be left to the decision of the two Governments; that he would attend to it carefully, and that the Chamber might rest convinced that he would do everything in his power to uphold the honour and rights of the French navy. M. Billault and M. Berryer spoke next, and after a new assurance from M. Guizot that he would throughout the negotiation defend the rights of nations and the interests of the country, the Royal ordinance was read by the Minister of Public Instruction, and the Chamber separated amidst cries of "*Vive le Roi.*"—The accounts of the Tahiti affair published in the Toulon Republican paper are of great importance. Although of course written in a spirit of hostility to Mr. Pritchard, whom they call "the principal instigator of these troubles," they allege no overt act against him, but on the contrary state that the "troubles" broke out on the 3d of March, that is, the day after Mr. Pritchard had been either in confinement or on board the Basilisk. In fact his removal seems to have been the precursor of a general revolt of the natives against the French authorities, who were attacked by the insurgents, and with such loss that their position is evidently one of considerable danger; and unless the Home Government send out reinforcements the French may be driven out of Tahiti altogether by the native population. The Paris papers state that on Friday the British Ambassador officially delivered the demand of reparation, requiring 1, the dismissal of M. D'Aubigny, the author of the measures adopted against the ex-Consul Pritchard; 2, the recal of Captain Bruat, who, on his return, has sanctioned the measures adopted by the *ad interim* Government; 3, the destruction of all the fortifications raised in the island whilst it has been placed under the *de facto* sovereignty of France; 4, the establishment of an English station of equal force to that of France, in order that, in no case, her Britannic Majesty's subjects may want sufficient protection." Whether these details be correct or not it is at present impossible to say, but it is certain that great uneasiness prevails in Paris, the price of Stocks has fallen, several English families have left Paris, and a general feeling prevails that with all the efforts that will be made by Republicans and Terrorists, by the friends of M. Thiers, and by those of Henry V., to embroil the existing Government with that of England, and for accomplishing which this affair will furnish them with abundant materials, it will be almost a miracle if the present Ministry maintain itself and terminate this matter pacifically.—The affairs of Morocco still maintain a most uncertain aspect. The Emperor had refused to accept the mediation of Great Britain, and had retired into the interior to escape the visit of Mr. Drummond Hay, who had however followed him at great personal risk. The Prince de Joinville had sent another ultimatum, an answer to which was expected on the 2d, failing which the Prince was to commence operations along the coast of Morocco. H.R.H. in the meantime had appeared off Tangiers, and brought away, with some difficulty, the French Consul and about 20 other French subjects. The Consul required the greatest precautions to embark, but the Moorish authorities detained the Chancellor of the Consulate and a large proportion of his countrymen. It was generally believed that the fresh delay of eight days granted to the Emperor in order that he might explain his intentions with respect to Abd-el-Kader would yield no pacific result, and that the bombardment of Tangiers would be the next step; but the advices received yesterday from Paris state that the Emperor is willing to give satisfaction, and that Marshal Bugeaud has suggested a further delay before hostilities are commenced. The *Journal des Débats* announces the departure from Paris for Toulon of Captain Bouet, Governor of Senegal, on his way to join the squadron of the Prince de Joinville. M. Bouet has been stationed a long time on the western coast of Africa, of which he has made a special study.—In the well-known case of the Marquess of Hertford and Suisse, the Paris Court of Appeal have decided against the latter, who will consequently have to refund 800,000 f.

SPAIN.—We have accounts from Madrid of the 30th ult., when that capital was tranquil, and the precautions of the authorities had subsided. The journals continue to dwell on the alleged recent conspiracy, which the Government prints now represent as a vast one, extending to several towns or provinces. The *Tiempo* states it to have been organised by the *Ayacuchos*, with the view of again proclaiming Espartero regent, or perhaps even king of Spain. According to the *Castellano*, the plot was to have broken out at the same time that Espartero landed on the coast of Galicia, and the discovery of the plan is due to the precipitation of his partisans, who were anxious that the revolution be accomplished by the 10th October. About 40 persons have been arrested, nearly all of whom are of the better classes, being principally proprietors and officers in the army. Among them are two colonels, a lieutenant-colonel, and several captains and lieutenants. It appears that the whole are to be handed over to a military commission.—Accounts from Barcelona announce that the Queen would leave for Madrid on the 10th inst., and return through Valencia.

GERMANY.—The late attempt on the life of the King of Prussia has excited the liveliest indignation in all parts of Germany, and his Majesty's danger was much more serious than was at first supposed. It appears that the assassin drew forth a double-barrelled pistol, and discharged both barrels in rapid succession at the King. Both balls grazed the stomach; but were, most providentially, turned aside by the folds of his Majesty's travelling-cloak and sword-belt. The first of the balls passed through the carriage window, and must have killed the Queen, were it not that the latter was at the instant engaged reading a petition, which had been presented to her a moment before by a poor woman, and was consequently in a bent posture. The presenting of petitions on such occasions is strictly forbidden; but in the present case it has been the means of preserving the life of one of the most amiable women that ever graced a throne. It was at first asserted that the petitioner was the daughter of the assassin, and that she was leagued with him in the plot; but this is not the case, the poor woman being the wife of a merchant in a distant province, who is sentenced to imprisonment. On the evening before their Majesties' departure, she stood at the palace-gate and presented to the King a petition for a mitigation of her husband's punishment. The King had spoken very graciously to her, and on the same evening had the matter discussed, with other things, and gave an order in compliance with the petition. The woman, fearing the King's departure might delay the fulfilment of her request, went to the palace gate on the following morning, and presented a similar petition to the Queen, just as her Majesty was stepping into the car-

riage. Her Majesty received it kindly, and gave it to the King, who, recognising the woman, told her to make herself easy, that her request was granted, and the necessary orders already given. The woman, relating the preceding particulars, says, that being deeply affected she was going to kneel, and express her wish that Providence would grant him a happy journey, when the individual fired a shot at her benefactor. This statement is signed by Baron von Arnem, Minister of the Interior. A more providential escape has seldom been witnessed. Never has such a thing been attempted before, nor has such an event ever occurred in Prussian history. The King and Queen arrived on the 26th ult. at Frankfort-on-the-Oder, in perfect health. After a short stay, their Majesties went on by Krossen to Christianstadt, where they slept, intending to proceed the next day to Erdmansdorf.—A letter from Cologne, of the 27th ult., states that the Government is about to erect a double bridge at that city across the Rhine, which will be unique of its kind. The two structures will be placed one over the other, the height of the upper one being 144 feet above the river. The lower bridge will be traversed by the railroad from Berlin to Cologne; the upper one will be for horses, carriages, and foot-passengers. In the vacant space between the bridges will be placed some Paixhans' guns for the purpose of breaking the ice in the river when necessary, and of defending the city of Cologne in case of siege. Baron Christian de Hartman, the engineer, will be intrusted with the erection of this work.

ITALY.—Letters from Florence, of the 30th, mention the death of Joseph Bonaparte, at one time King of Naples, and afterwards of Spain. He died on the 28th ult., after a long illness. His brothers, Louis and Jerome, were with him in his last moments. Prince Louis is now the head of the family, but his health is also very bad, and his successor is Prince Louis-Napoleon, the prisoner at Ham. Romagna is stated to be still in a very disturbed state. It is said, too, that the Pope is dangerously ill.

GREECE.—Letters from Athens of the 22d ult. state, that perfect tranquillity continues to prevail throughout the country, although a few election riots which were but momentary have been magnified, for party purposes, into serious disturbances. The elections are now nearly over, and there is no doubt that Mavrocordato's Government will have a decided majority. The rebel, General Grivas, whom the French Minister refused to deliver up to the Greek authorities, on his arrival from Lepanto on board the French steamer Papin, but caused him to be conveyed to Syria by a French vessel of war, has been unanimously elected Deputy for Vonitza. Accounts from Egypt complete the history of this transaction, and inform us that the General arrived at Alexandria on the 10th ult. The Pacha of Beyrout would not allow him and his followers to land at that port, because he dreaded their influence on the malcontents of Syria. He made no objection to Grivas proceeding by land to Egypt, but he would not allow those who accompanied him to retain their arms. The General is at this time under the protection of the French Consul-General at Alexandria. The heat in all parts of Greece has been, and continues excessive. The thermometer has stood at Athens at 36 degrees of Reaumer in the shade. In the plains of Bœotia several reapers have dropped down dead from the burning heat.

Parliament.

HOUSE OF LORDS.

Friday.—After the conversation, noticed in our last, on the affair of the Maltese executed for murder at Tunis, the report of the Secret Committee on the Post Office was presented by Lord COLBORNE, and ordered to be printed.—On the motion for the third reading of the Railways Bill, the Bishop of LONDON moved an amendment, confining the interference of Government in railway travelling to week-days only, exclusive of Christmas day and Good Friday. The effect of the amendment would be, not to prevent travelling on a Sunday, but to avoid the promotion and compulsion of Sunday travelling by a legislative Act, and under the inspection of the Government.—Lords BROUGHAM and MONTEAGLE opposed the amendment on the ground that it would leave the poorer classes at the mercy of the railway directors on the only day they had for their recreation or private affairs.—The Earl of WICKLOW supported the amendment.—The Duke of WELLINGTON moved an adjournment of the debate, as he did not think the provisions of the Bill were well understood. The debate was accordingly adjourned.—On the motion for the third reading of the Unlawful Oaths Ireland) Bill, the Marquis of CLANRICARDE reviewed the present condition of Ireland, contrasting it with what it was under the late Government, dwelling on the grievances of the Irish people, pointing out the remedies for them, and the policy which would prove conciliatory, and contending that the repeal agitation was now as rampant and as dangerous as ever. He pressed on Government the necessity of adopting measures large enough to alleviate physical destitution, mitigate political discontent, and insure the peace and tranquillity of the country.—Lord WHARNCLIFFE recounted the measures adopted by Government during the present session, the increased grant for education, and the announcement respecting Maynooth, as evidence of the anxiety of the Government to treat Ireland as an integral portion of the empire—to govern it not by means of a party, but on equal and impartial principles.—Lord MONTEAGLE urged that beneficial laws placed on the statute-book would be the best answer to those who demanded the repeal of the union.—The Earl of WICKLOW replied that no legislation of the Imperial Parliament would satisfy the repeal party. He believed that the Government were sincerely desirous of ameliorating the condition of the Irish people.—Lord CAMPBELL regretted the crippled state in which they engaged in this discussion; they were precluded from referring to the state trials, and a review of the condition of Ireland without reference to Mr. O'Connell, was like the play of HAMLET with the part of *Hamlet* omitted for that evening "by particular desire." He would rather see the constitution suspended than the law perverted; no good would be done until they treated the Catholics of Ireland as their fellow-subjects.—Lord WHARNCLIFFE made a few observations in reply, and the Bill was read a third time and passed.

Monday.—The Earl of RADNOR laid on the table a Bill to amend the Post Offices Acts Consolidation Act. In doing so he said that the report of the Secret Committee was a most milk-and-water meagre document; but still it appeared from it that the letters of a refugee foreigner had been opened, and that not with a view to the safety of this realm or of Her Majesty's person. Likewise it stated that it had been the practice for the foreign correspondence of foreign Ministers to be sent from the Post Office to the Foreign Office, but that as the Postmaster-General found that he was not authorised to do so, the practice had now been discontinued altogether.—The Marquis of CLANRICARDE, in presenting a petition from leaseholders of church property in Nottinghamshire, censured the conduct of the Ecclesiastical Commission in refusing the renewal of leases, and intimated his intention of moving for a searching inquiry into the subject during next session.—The Bishop of LONDON defended the commission, which was acting on what was its duty, that of rendering Church property available, to its full and fair value, for the purpose of extending the means of the Establishment in providing for the spiritual destitution of the population.—The Duke of RICHMOND considered that the commission was the worst possible body that could be constituted for managing Church property, and hoped that inquiry would be made into its proceedings.—On the third reading of the Railways Bill, the Bishop of LONDON moved the amendment of which he had given notice, substituting for the words "every day" "every week day, with the exception of Christmas Day and Good Friday." This amendment was agreed to.—Lord WHARNCLIFFE then moved a proviso, to the effect that when railway trains travelled on Sundays for the conveyance of passengers, there should be at least one train of third class carriages, and that this train should stop at as least as great a number of stations as any other train.—As an amendment to this, Lord MONTEAGLE moved that the third class carriages should be "with seats and protected from the weather." On this amendment their lordships divided—Contents, 30; Non-contents, 35: Majority, 5.—Lord MONTEAGLE's amendment was lost, and Lord WHARNCLIFFE's proviso agreed to.—The Bill was then read a third time and passed.—The Earl of MINTO called attention to the present state of our naval establishment, which, he contended, was wholly insufficient, looking to the present posture of public affairs, and the possibility of the peace of the world being disturbed. We had but nine ships of the line in commission; the Mediterranean fleet consisted of only one, and we had but two to protect the coast of England, should any emergency arise; and if war were to occur, there was nothing to prevent an enemy from sweeping the Channel and the West Indies. The noble earl also adverted to the recent occurrences at Tahiti, blaming the Government for leaving our interests neglected and unprotected in that part of the world, and moved for a return exhibiting our actual naval force.—The Earl of HADDINGTON censured the Earl of Minto with making an inconvenient speech, without having a parliamentary case to justify it. This country had overwhelming means of defence available, should war arise; though our present number of ships of the line in commission was small, they were well manned; and our dockyards were busily occupied in the building of additional vessels, and in adding to the strength of our steam marine. He alleged that the Government had done its duty in watching British interests in the Pacific, but he abstained from present comment on the recent occurrences at Tahiti.—The Duke of WELLINGTON, to whom Lord MINTO had referred as having, when out of office, repeatedly enforced the necessity of a considerable naval force, explained that he had done so only because the country was at the time engaged in actual war, which the Government of the day was endeavouring to carry on with a peace establishment. He believed that the present force was amply sufficient to afford protection to British subjects in every part of the world; but he declined to advert to the "eccentricities" of the French authorities at Tahiti, otherwise than as acts for which they would be required to render an account. A great outrage had been committed, for which he had no doubt that satisfaction would be given; and this was much better than that there should have been an attempt by the naval officer in command, to prevent by force what had occurred.—The Marquis of CLANRICARDE thought that even the weakness of the navy was not equal to the weakness of the defence that had been set up for the Government. He ridiculed the affectation of treating such subjects as that of the late outrage at Tahiti as too delicate for discussion, and maintained that our naval force was not now adequate to the due protection of our commerce. He did not fear war, but the best mode of preventing it was to be prepared for it.—Lord HARDWICKE supported Lord HADDINGTON; and Lord MINTO having replied, his motion was lost without a division.—Lord WHARNCLIFFE moved the committal of the Poor-law Amendment Bill.—The Duke of RICHMOND went through its provisions, and stated that, as a whole, he approved of the Bill as an amendment of the law, hoping, nevertheless, that a further amendment will be hereafter made in it.—Earl FORTESCUE, Earl of HARDWICKE, Lord LYTTELTON, Lord STRADBROKE, Earl of RADNOR, the Marquis of NORMANBY, and other Peers discussed the Bill at considerable length. They chiefly objected to the late period of the session at which the Bill was brought before them.—The Bishop of EXETER moved the adjournment of the debate.—Lord WHARNCLIFFE declared that rather than throw over the consideration of this Bill to another session he would prolong the sitting of Parliament.—The Bishop of EXETER did not divide on the question of adjournment, and their lordships went into committee *pro formâ* on the Bill.—The Merchant Seamen's Registration Bill was read a second time, and some routine Bills were forwarded a stage.

Tuesday.—The Royal assent was given by commission to the Three-and-a-Half per Cent. Dissentients Bill, Ecclesiastical Jurisdiction Bill, Debtors and Creditors Bill, Militia Pay Bill, Alien Act Amendment Bill, Clerks of Crown in Chancery Bill, Privy Council Bill, New South Wales Administration of Justice Bill, Trafalgar-square Bill, Detached Parts of Counties Bill, Land-tax Commissioners Bill, Farm Buildings Bill, Licences Bill, Duchy of Cornwall Bill, Criminal Justice (Middlesex) Bill, New South Wales Customs Bill, Books and Engravings Bill, Transfer of Property Bill, Unlawful Oaths (Ireland) Bill, Party Processions (Ireland) Bill, Dublin and Cashel Railway Bill, Wishaw and Coltness Railway Bill, North Wales Railway Bill, London and Croydon Railway Bill, Ayr Bridge Bill, Swansea Improvement Bill, Hull Docks and Harbour Bill, Rochdale Improvement Bill, Isle of Wight Improvement Bill, Warwick Improvement Bill, and several Estate and Divorce Bills.—The Duke of WELLINGTON moved, and Lord MELBOURNE seconded, an address of congratulation to Her Majesty on the birth of a Prince, which was carried unanimously.—Lord BEAUMONT having drawn attention to the affairs of Servia, the Earl of ABERDEEN professed himself unacquainted with, and sceptical as to, the facts which related to Russian interference.—The Earl of MINTO inquired if the court-martial on Lieutenant Gray had been demanded by any foreign power.—The Earl of HADDINGTON replied that France had complained of a violation of the right of search, and the English Government of its own accord had directed the court-martial.—The Marquis of NORMANBY called attention to the state of public business before the House. No less than 10 Bills had that day been disposed of, respecting which their Lordships had heard only the titles and the preambles; but there were two others, that for amending the Poor-law, and that upon Metropolitan improvements, which especially required the laborious consideration which at this period of the session it was impossible to afford them. No excuse for the delay in bringing up the Bills was suggested by any activity in legislation upon other subjects, for but two acts of importance had been achieved in the last five months. Of the measures recommended in the royal speech, the Bank Charter Bill had certainly been carried, but that for the better registration of Irish electors had been ignominiously withdrawn, although the question had been for four years under deliberation. The Irish Land Commission he looked on as an instrument of delay rather than of inquiry, and that purpose it appeared likely to answer. It might be said that business had been as much in arrear under the Ministry of which he had been a member, but they had had to struggle with an adverse majority in one House, and possessed but a very scanty one in the other; while the present Government had an overwhelming preponderance in both branches of the Legislature—an advantage which, if not grossly mismanaged, should have prevented the necessity of deferring the whole business of legislation to the last week of the session.—The Duke of WELLINGTON vindicated the Government from any charge of inattention to their duties, and contended generally that the business of the House had been efficiently conducted. Some of their measures had indeed met with only indifferent success, but for this no Minister could be responsible.—The Marquess of LANSDOWNE reiterated the complaint that Bills were brought up from the House of Commons in such numbers, and at so late a period, as necessarily to preclude discussion.—Lord WHARNCLIFFE cited several important measures which had been passed, and which would, he thought, prove that the session had not been unfruitful.—After a few observations from the Marquess of CLANRICARDE and Lord WILTON, the Marquess of NORMANBY replied, and his motion which was for certain returns relative to the transaction of the public business in the House, was agreed to.—On the question for going into committee on the Poor-law Amendment Bill, the Bishop of EXETER urged that there was no time for the consideration of so important a measure, and thought it better to drop the measure, and take it up early in the next session of Parliament. He entered at great length on the general question of the Poor-law, arraigning the Malthusian doctrines on population, pleading the rights of the poor, scripturally and constitutionally, condemning the present Poor-law system, and concluded by moving the commitment of the Bill that day six months.—The Duke of WELLINGTON did not consider that the period of the evening was too late, the Members present too few, or the session too far advanced, to consider a measure recommended by the deliberate sanction of the House of Commons, which had been contemplated for several years, and the purport of which was to remove evils found to exist in the present Poor law. The object of the Bishop of Exeter was the repeal of the existing law, which had been devised to correct the enormous mischiefs of the old system. If he were in earnest, let him bring in his measure either of repeal or of amelioration, and submit it to the consideration of Parliament, instead of attempting to stop the present Bill.—The Marquess of NORMANBY criticised the speech of the Bishop of Exeter, and defended the administration of the law by the Poor-law Commission.—Lord WROTTESLEY was fearful that the clauses in the Bill amending the law relating to bastardy would lead to the revival of the evils of the old system.—A division was called for, when the amendment of the Bishop of Exeter was rejected by 17 to 1.—The Bill then passed through committee.

Wednesday.—The Merchant Seamen's Bill was read a third time. The Commons' amendments to the Charitable Donations (Ireland) Bill were agreed to. The Fisheries, and the Arms (Ireland) Bills passed through committee. The report of the Poor-law Amendment Bill was received.

Thursday.—The Marquis of NORMANBY presented a petition from the Missionary Society of Leeds, respecting the recent occurrences at Tahiti, and expressed his opinion that Mr. Pritchard had in no respect forfeited that protection which he derived from the commission of his sovereign. To this the Duke of WELLINGTON, with other Peers, exclaimed, "Hear, hear!"—The Earl of ABERDEEN replied, that when the French established themselves in Tahiti, the necessary guarantees were given that the interests of British subjects would not be interfered with. As to Mr. Pritchard, it made little difference whether or not he were recognised as British consul at the time of his arrest. He was a British subject, and as such entitled to protection. He should not desire peace at the expense of the honour of this country; but looking to the existence of a "war" party in France, he thought it wise and expedient that in all our negotiations with that country we should be cautious to preserve strict moderation and justice. He used the word "justice," lest "moderation" might be misconstrued. He had no doubt that a just, conciliatory, and moderate tone would prevent any disastrous results arising from occurrences which had taken place without the participation of either Government.—In reply to the MARQUIS OF CLANRICARDE, the Earl of ABERDEEN said he was not in a position to give the Spanish bondholders assurance of any materially better prospect of realising the financial operation expected from the scheme entered into in the year 1834 by Count Toreno. He could, however, say that the present Finance Minister of Spain was a man more likely to be influenced by large, liberal, and just views of what was due to the honour and interests of his country than any person who had filled that situation for some years past.—The Poor-law Amendment Bill was read a third time and passed.—The Commons' amendments to the Insolvent Debtors Bill were agreed to, and the Bill passed.—The Commons' amendments to the County Coroners' Bill were rejected, on a division, the numbers being equal, but the non-contents prevailing, according to custom.—A great many Bills were passed through a stage, and several conferences held with the Commons.

Friday.—The Royal Assent was given by Commission to the Consolidated Fund Appropriation Bill, Church Endowment Bill, Poor-law Amendment Bill, Counties and Boroughs Bill, Duchy of Cornwall Assessionable Manors Bill, Roman Catholics Penal Acts Repeal Bill, Metropolitan Buildings Bill, Piccadilly Improvement Bill, Insolvent Debtors Bill, Railways Bill, Turnpike Trusts (South Wales) Bill, Controverted Elections Bill, Woods and Forests Bill, County Coroners Bill, South Sea Company's Bill, Savings Banks Bill, Slaughtering of Horses Bill, Clerks to Attorneys Bill, Tralee Harbour Bill, Marriages (Scotland) Bill, Salmon Fisheries (Scotland) Bill, Marriages (Scotland) Bill, Spirit Licences Bill, Grand Canal (Ireland) Bill, Arms (Ireland) Bill, Registration Bill, Protection of Purchasers (Ireland) Bill, Charitable Donations and Bequests (Ireland) Bill, Grand Jury Presentment (Dublin) Bill, Middle Level Drainage Bill, and several other private Bills.—The amendments of the Commons to the Irish Common Law Courts Bill, which give the appointment of certain law officers to the Lord Lieutenant, and not to the Judges, were opposed by the Lord CHANCELLOR, but carried on a division by 22 to 13.—[Left sitting.]

HOUSE OF COMMONS.

Friday.—After the Insolvent Debtors Bill had gone through committee, the CHANCELLOR of the EXCHEQUER said that he had for some time past been in communication with the India Board, for the purpose of establishing a fortnightly communication with India and China, and from the information he had received that day, he believed this increased communication would commence in January next.—The Art Unions Bill was read a third time and passed.—The Charitable Donations and Bequests (Ireland) Bill was re-committed, and Sir J. GRAHAM introduced two new clauses to meet the objections of gentlemen opposite. One of these, he said, was for the purpose of avoiding the difficulties started as to the probable interference of the commissioners with matters relating to the doctrines, discipline, and constitution of the Churches of England and Rome, instead of which words he intended to substitute words which would confine their authority to all matters of charitable donations and bequests, respecting which any question arose concerning the usages and discipline of the Church of Rome and of England. The next alteration he proposed was in the leasing clause. At present the priest, upon whom any building was bestowed as an endowment, would be compelled personally to reside in it, but the new clause gave him the power of leasing, only taking security against waste and subletting in fines.—Mr. WYSE and Mr. M. J. O'CONNELL returned their acknowledgments to the Home Secretary for the deference paid by him to their wishes, and the clauses were added to the Bill.—The Debtor and Creditor Bill, the Transfer of Property Bill, and the Arms (Ireland) Bill passed through committee.—Mr. HUME moved resolutions relating to Savings Banks, with a view to the House pledging

itself to take the subject into consideration in the next session.—The CHANCELLOR of the EXCHEQUER objected, and the resolutions were negatived.

Saturday.—The House sat for 20 minutes, during which time they read a third time and passed the Marriages (Ireland), the Debtors and Creditors, and the Arms (Ireland) Bills—passed through committee the Insolvent Debtors' Compensation Bill—and received the reports of the Charitable Donations and Bequests (Ireland), and the Transfer of Property Bills—besides advancing some private Bills.

Monday.—Lord VILLIERS took his seat for Cirencester.—The Leeds Vicarage Bill was read a third time and passed, and a great many other Bills were advanced a stage.—Sir R. PEEL moved the second reading of the Bill sent down from the House of Lords to repeal the obsolete penal acts against the Roman Catholics. No security provided by the act of 1829 was touched by this measure, the effect of which was to place all Roman Catholics, taking the Roman Catholic oath, on the same footing with Protestants in respect of franchises and civil rights, and to repeal some acts which had become a dead letter. One of these made it a crime to maintain the spiritual supremacy of the Pope; another made it punishable to neglect attendance at divine service on the 5th of November; and another prohibited a Roman Catholic from having a horse worth more than 5*l.* Really, in repealing such laws the Legislature was not so much conferring a favour on the Catholics as relieving its own Statute-book from a disgrace. So far from being bulwarks to the Church, these laws were outworks which might be used by reason and ridicule against her. The Establishment in these days must be maintained, not by defences of that kind, but by sound argument and the affectionate attachment of the people.—Mr. HAWES asked whether it was intended also to repeal the obsolete laws affecting Protestant Dissenters?—Sir R. PEEL, without pledging himself on a subject not then before the House, was ready to declare that if there were any law imposing heavy penalties on Dissenters for absenting themselves from divine service on account of conscientious objections, he would support the repeal of that law.—On the order of the day for the third reading of the Irish Charitable Donations Bill, Mr. D. BROWNE expressed a hope that it would be postponed. The Roman Catholic hierarchy of Ireland were opposed to it, and Mr. Wyse's approval of it was no reason why it should pass, for that gentleman did not possess the confidence of the Roman Catholic clergy. He believed it, indeed, to have been proposed in a spirit of conciliation; but still that was not with him a sufficient inducement to support it. He moved that it should be read a third time this day six months.—This amendment found no seconder.—Mr. M. J. O'CONNELL said, that after the best consideration he had felt it his duty to abstain from joining the opposition to this Bill. He liked its spirit, which he thought of more importance than its words. It had no compulsory operation, and it affected a great good by raising the worldly condition of the Roman Catholic clergy without diminishing their influence over their flocks.—The Bill was read a third time and passed.—In reply to CAPT. PECHELL, Mr. S. HERBERT said that no foreign Government had anything to do with the holding of the Court-Martial on Lieut. Gray, and that as soon as the circumstances had come to the knowledge of the Admiralty the holding of the Court-Martial had been ordered.—In committee on the Insolvent Debtors Bill, Mr. M. PHILIPS objected to the clause abolishing imprisonment for debts below 20*l.* It would prevent a poor man from obtaining credit.—Sir J. GRAHAM said that the Bill had been so framed as to give to the creditor every facility of proceeding against the goods of the debtor. But as the abolition of imprisonment was the very essence of the measure, he thought it would be best to postpone this clause now, and take the discussion of it upon the third reading.—The committee then proceeded with the remaining clauses.—The House adjourned after some other business, to five o'clock in the afternoon, when Mr. GLADSTONE obtained leave to bring in three Bills for the consolidation of the various acts relating to public companies and the construction of railways, in order that they may be printed and circulated during the recess. He also, in committee of the whole House, obtained leave for a like purpose, to bring in a Bill to amend the laws relating to the support and relief, in certain cases, of merchant seamen, their widows, and children.

Tuesday.—The Penal Acts Repeal Bill passed through committee, and the CHANCELLOR of the EXCHEQUER gave notice that Government would, next session, introduce a Bill to include all Irish Roman Catholic Penal Acts in the present measure.—The Lords' Amendments to the Railways Bill were agreed to, and one proviso was added, to the effect that the prices charged for conveyance on Sundays should not exceed those charged on week days.—Sir R. PEEL moved an address of congratulation to her Majesty on the birth of a Prince, which was seconded by Lord M. HILL, and agreed to unanimously.—Sir R. PEEL said that the report that the Members taken from Sudbury are to be given to Middlesex, was premature.—In answer to Mr. T. DUNCOMBE, Sir R. PEEL stated that the prorogation of Parliament could not take place until the House of Lords had given their decision on the O'Connell writ of error. No decision, he said, could be given until the Judges came to town, and when they did so he understood they were anxious to have a conference.—Several conferences with the House of Lords were held, touching Bills upon which amendments have been made.—Capt. BERNAL, adverting to the instructions avowed by Sir R. Peel to have been given to Lord De Grey in 1841, with respect to the disposal of Church patronage in Ireland, contrasted them with the appointments actually made, the majority selected being individuals all violently opposed to the national system of education, for which the House had given an additional grant of 25,000*l.* If the Government were sincere in carrying it out, there would be no difficulty in finding proper persons for elevation to ecclesiastical dignities; those members of the House who roared like lions in the Rotunda at Dublin, were meek as lambs when increased grants for Irish education were voted, and the due disposal of Church patronage would quickly tame rampant ecclesiastics. He moved for a copy of the instructions issued to Lord Heytesbury on the subject of the future disposal of that patronage.—Sir R. PEEL contended that Lord de Grey had faithfully fulfilled the implied conditions on which he undertook the government of Ireland, which was to dispense Church patronage with a view to professional merit and private character. He adduced figures, showing the progressive increase in the number of schools and children connected with the national system of education, which he vindicated from the imputation of prohibiting the reading of the Scriptures. The refusal of Government to accede to the request for a separate Parliamentary educational system for the children of members of the Establishment in Ireland was a proof of their sincere and anxious desire to promote united education, without distinction or exclusion. In personal communication with Lord Heytesbury, the views of Government had been explained; but no stipulation had been made with him that ecclesiastical promotion should be dependent on the sole condition of approval of the national system. This would be holding out an unworthy inducement, which would not only be degrading to Government, but unwise and impolitic, inasmuch as it would defeat the end they had in view, that of conciliation and union.—Mr. WYSE pointed out the beneficial effects which the national system was producing.—Lord EBRINGTON and Mr. DARBY made some observations, and Mr. SHEIL complained that the "rule" of Sir R. Peel was counteracted by the practice. Between the disposal of Church patronage and the policy of the national system the Church was set in array against the people. They were sincere in their intentions; but the Lord Lieutenant defeated the Home Office by the promotion of ecclesiastics whose opposition to the national system had been stigmatised by Lord Eliot as "factious," in a speech made about two years ago.—Lord ELIOT disclaimed having applied the word "factious" to the clergy of the Establishment, though he admitted that at the time he had attributed the comparative failure of the national system to their opposition. It was, however, abating. He claimed for Lord de Grey the credit of looking to professional merit in the disposal of his Church patronage.—Mr. M. J. O'CONNELL criticised the elevation of Dr. Daly to the episcopal bench, his literary claims resting on his editorship of the "Christian Examiner," and his professional merits being tested by the fact that, as rector of Powerscourt, he had advised the refusal of a site for a chapel to his Roman Catholic parishioners, and drove them to worship in a miserable barn.—Capt. BERNAL withdrew his motion. He, however, did not regret the discussion which had been raised by it.

Wednesday.—In reply to a question by Lord EBRINGTON, Sir R. PEEL stated that a memorial from the chiefs of the Gaboon River, West Africa, and also from some merchants trading to that coast, had been received, complaining of certain acts done by the French authorities there, which were alleged to be prejudicial to the commerce of this country. The memorial of the merchants was, however, drawn up on a misapprehension of facts, for it assumed the settlement of the Gaboon River to be British, whereas no authorised flag of ours had ever been hoisted there. The Premier added that he could give no assurance that any proceedings would be taken by the Government on this memorial, but could promise that the facts would be inquired into.—Lord PALMERSTON then called the attention of the House to the foreign policy of the Government. He commenced by denouncing altogether the system adopted by Ministers, which he denominated "a system of resistance at home, and of unlimited concession abroad." They had begun, he said, by making a great concession to the United States, and were repaid by the United States by a demand for still greater ones. They had conceded to French intrigues in Spain, and the consequence was that Espartero had fallen, and the moral power and the interests of this country were lowered in the Peninsula. In Otaheite they acquiesced in French aggression, and the result was that still greater aggressions were perpetrated. This was the carrying out of their original principle of concession, begun in 1830, when they acquiesced in the French occupation of Algiers; and the consequence of this principle was, that when questions arose between the two countries, when the British Government wished that something should be done, or something refrained from, all that the French Government had to do in order to avoid compliance with the demand, was to get the so-called war-party or the Opposition newspapers to abuse them, and to call for their expulsion from office. Neither by hope held out to smaller states, nor by fear impressed on greater countries, was the influence of Great Britain maintained by the present Government. The noble Lord then turned to the late transactions in Otaheite. He contended that Mr. Pritchard, at the period of his imprisonment, although ceasing to exercise his functions, was invested with the character of his commission as Consul, and that his position was then similar to that of an Ambassador who has given up communication upon a disagreement with the Government to which he was accredited. His Lordship concluded by saying he had not spoken with the intention of adding to the difficulties of Ministers. He was perfectly aware of the serious nature of those difficulties, but would they not be lessened by placing the ground work of the case upon a fair and just footing? If they were willing to deal with the matter more lightly than they were disposed to look upon it at first, let it be upon ground that would not lead hereafter to dangerous consequences, but on those of honour and justice, otherwise it would be vain for them to expect to give satisfaction to the nation. There might be a departure from the tone and temper in which the news was first received, but there ought to be no concession which would tend to the dishonour of this country.—Sir R. PEEL denied that any unworthy concession had been made. He vindicated the conduct of Ministers with respect to the United States, to Africa, and to Spain; and maintained that the name and honour of the British Government never stood higher than at this time.—The Bill for repealing the Roman Catholic Penal Acts was reported.—On the motion for the third reading of the Insolvent Debtors Bill, a motion was made by Mr. M. MILNES, and carried on a division, for giving compensation to Mr. Warburton, who had acted as Deputy-Registrar to the Court of Bankruptcy. Mr. SPOONER moved an amendment, which would have the effect of postponing the operation of the Bill to the 25th March next. After a discussion the amendment was negatived without a division, and the Bill was read a third time and passed.—Sir J. GRAHAM moved for leave to bring in a Bill for the regulation of the medical practice throughout the United Kingdom. The Right Hon. Baronet at considerable length explained the principles and leading features of his plan. He proposed to establish a Council of Health and of medical education, in direct connection with the Executive Government. This council is to sit periodically in London, and to be composed of eleven *ex officio* members, and six members to be chosen by the Crown. Under the directions of the council a registry is to be kept of all the physicians, surgeons, and licentiate apothecaries duly qualified to practise, and after the expiration of one year this list, and this list alone, is to be regarded as the proper legal authority of the practitioner. He did not propose to put down quacks by means of penalties, because "the pleasure was as great in being cheated as to cheat," but he proposed to confine the civil and military public medical appointments to such persons as should be registered under this Bill. He proposed to repeal the Apothecaries Act, and to do away with the necessity of apprenticeships, and he intended to abolish all exclusive or local privileges, and admit the practitioners of England, Ireland, and Scotland to practise indiscriminately in all parts of the United Kingdom. The power of the existing 17 licensing bodies is to be retained so far as the granting of letters testimonial, which are to be received by the council of health as sufficient to warrant the registry of the party applying without any examination. This Bill, he said, is brought in with the design of being circulated during the recess.—Mr. MACAULAY seconded the motion, and cordially approved the general principle of the Bill.—Mr. WARBURTON concurred.—Mr. G. KNIGHT was afraid that the medical profession would scarcely approve the constitution of the Council of Health, which they would probably desire to see elective.—Mr. WARLEY took the same objection. He admitted that the welfare of the public ought to be the first consideration; but he feared that the Right Hon. Baronet had been deceived by wilful and interested persons. It was impossible that the 30,000 medical men of this country would suffer such a Bill to pass. This Bill went not to inflict any penalty on persons practising medicine without a licence; and yet the law forbade an unlicensed attorney from practising law; so much more careful was the Legislature to protect the property than the lives and limbs of men. There were other subjects which were not dealt with in this Bill, but which ought to be included in any measure professing to be complete. In his judgment, no man ought to be admissible as a practitioner in any department of the medical profession who had not passed a public examination.—Mr. HAWES was inclined to approve the general outline of the measure.—Sir J. GRAHAM gave some explanations in reply; and leave was given to introduce the Bill.

Thursday.—The early business consisted of conferences with the Lords on the subject of conflicting amendments on various Bills, which were however ultimately agreed to.—Mr. T. DUNCOMBE called the attention of the House to a breach of privilege, committed by the Rev. Mr. Dobree, in writing him a letter of a menacing character, on the subject of the statements which he had made in that House about Mr. Dobree's conduct and character, in connexion with the recent affairs of Guernsey.—Sir J. GRAHAM thought that Mr. Duncombe, considering the sort of expressions he had used respecting Mr. Dobree, was hardly entitled in fairness to make this complaint.—Mr. BROTHERTON wished to know whether Government contemplated any further measures tending toward the abolition of capital punishment. He referred to the late accident at Nottingham, where 12 or 13 persons were trampled to death in a crowd assembled to view an execution for murder.—Sir J. GRAHAM said that Government had no such intention. The calamity which had been mentioned might equally have occurred at a race, a show, or any other meeting where large numbers of people were assembled.—The CHANCELLOR of the EXCHEQUER intimated that, in consequence of numerous frauds, the returns of newspaper stamps will be made up hereafter in the gross, exhibiting the entire amount, instead of in detail for each paper.—Sir J. GRAHAM moved for leave to bring in a Bill to alter the law of settlement. By it he proposed to leave undisturbed settlements already ascertained, and to make birth the ground of settlement for the future. He proposes likewise to create a class between the settled and unsettled, viz., of paupers unsettled but not removable; and that all parties shall be relieved where they are found, irrespective of the question of settlement. He proposes that the justices should form rules in their respective districts for the removal of paupers, and provides an appeal to the sessions against any removal. The Bill is to be circulated during the recess. It was brought in and read a first time.—Sir J. GRAHAM also obtained leave to bring in a Bill—"the last Bill he said which it was his duty to lay before the House"—for regulating the duties and fees of clerks of magistrates, clerks of the peace, and clerks of assize.—Sir J. GRAHAM then explained the amendments introduced by the Lords into the Poor Law Bill, and moved that the House agree to them.—Captain PECHELL took the opportunity to advert to the Gilbert Unions; after which, the Lords' amendments were agreed to.

Friday.—Sir R. PEEL moved that the House, at its rising, do adjourn until Thursday the 5th September.—Mr. SHEIL said, that he supposed that this long adjournment had reference to the imprisonment of Mr. O'Connell and the other traversers. He appealed most earnestly to Ministers to anticipate the decision of the Judges and at once unbar the prison doors.—Mr. WYSE also implored the Government to act on this suggestion as a measure of mercy and justice.—Lord J. RUSSELL followed, advising Mr. O'Connell's release, and then taking a general review of the state of the country. In some respects he said there was cause for congratulation, but he should feel it his duty early next session, if Government did not bring forward some measure for the relief of the lower classes, to move for a committee of the whole House to inquire into the cause of distress, and consider whether a fair day's wages might be obtained for a fair day's work. He thought a favourable change had been made in the currency, but he wished to see a more equal mode of taxation; at present he did not think taxation was equal, it pressed more heavily on the poor than the rich.—Sir R. PEEL rose to reply, and was left speaking.

CITY.

Money Market, Friday. — Consols for account closed at 99 $\frac{1}{8}$ for money, and 99 $\frac{1}{8}$ $\frac{1}{4}$ for the account, Three per Cent. Reduced 100, Three-and-half per per Cent. Red. 102$\frac{3}{8}$, New Three-and-half 101$\frac{1}{2}$, Exchequer Bills 75 77, and Bank Stock 200$\frac{1}{2}$.

GAZETTE OF THE WEEK.—BANKRUPTS.—G. C. SMITH, Kensington, Middlesex, builder—E. MANLEY, Chapel-street, and 70, Strutton-ground, Westminster, boot-maker—T. TURNER, Sheffield, grocer—H. J. E. SAFFRAN, Huddersfield, Yorkshire, cloth-merchant — W. WYRILL, Bradford, Yorkshire, ironmonger—R. JACKSON and R. YALE, Leeds, machine-makers—J. TREVITT, Wheaten Aston, Staffordshire, butcher—T. CARTER, jun., Waltham, Leicestershire, butcher—A. OGDEN, Lancashire, sizer—R. EDWARDS, Aberdovey, Merionethshire, draper—J. W. and E. YEARDLEY, Ecclesfield, Yorkshire, flax-spinners—H. J. and J. DIXON, Kidderminster and Aldermanbury, carpet-manufacturers — J. INNES, Cheltenham, ironmonger—J. ELSE and W. DIXON, Kingston-upon-Hull, millers.

SCOTCH SEQUESTRATIONS. — J. RAMSON, Perth, glass-merchant—S. HAY, Glasgow, farmer—R. JOHNSTON, Glasgow, rag-merchant.

Metropolis and its Vicinity.

The House of Commons.—Immediately after the adjournment of Parliament, Bellamy's-rooms, the Vote-office, and a considerable portion of the lobby are to be pulled down, to afford room for the improvements about to be commenced for the approach to St. Stephen's Hall. The ancient crypt of St. Stephen's Chapel is to be cleared and entirely restored, that part of the former Houses of Parliament not having received any considerable injury when those Houses were destroyed by fire some years back. The cloisters, remarkable for what remains of their original architecture, as well as the crypt, are intended to be restored to their primitive state.

River Steamers.—A committee of Aldermen was held on Saturday at Guildhall, for the purpose of hearing any objections which parties interested in the steam navigation of the river might have to the draft rules suggested to the Court of Aldermen for the regulation of steam-vessels. The Town-Clerk read several regulations relating to the number of persons to be allowed to be taken on board, and to the speed of the vessels. They ruled that no steam-vessel, whose voyage was within the limits, should be licensed to carry more than one passenger for every four square feet of deck; and that the speed should not exceed six miles an hour with the tide, nor four miles an hour against the tide. By the second of these regulations, the dangers hitherto so imminent in the pool would be averted, and by the first the inconvenience as well as danger to passengers would be obviated. In explanation of the rule on the subject of carrying passengers, it was objected that the steam-vessels which were now notorious for carrying 1000 or 1100 passengers, would, according to the calculation made, be permitted to carry no more than about 635. It was also stated that in order to prevent a greater number from going on board than would be admissible by the regulation, it would be absolutely necessary to have the police in constant attendance at the places of embarkation. The Lord Mayor said that the proprietors of steam-boats were under no necessity of troubling their heads upon that subject, as the necessary preparations should be made. It was objected that the steam-vessels might, with safety, be allowed to carry at the rate of four passengers per ton, and that the speed might be permitted to be eight miles an hour with tide and six miles against tide. The committee stated that the objections should be taken into consideration with all possible expedition, so that the public may rely on an early decision.

Passengers to Gravesend.—It appears from a return of passengers landed and embarked at the Terrace and Town Piers, Gravesend, in the month of July, that the Terrace Pier, with nine boats, had 224,635, and the Town Pier, with eleven boats, 167,072 passengers; the

gross number of passengers being 391,707, of whom there were to and from Blackwall, 253,474; and to and from Hungerford-market, Waterloo-bridge, London-bridge, and other places through the pool, 138,233.

Metropolitan Improvements.—On Monday a communication was opened for foot passengers from Oxford-street to Charlotte-street, Bloomsbury, on the south side of the new thoroughfare that is to connect Oxford-street with Holborn, by which the circuitous *route* in front of St. Giles's Church may be avoided. The passage is across the cellars which have been built for the new houses on that side of the street. On the north side of the way the whole of the ground is nearly excavated for the vaults, which will be completed in a short time. In digging the ground about the spot where stood the hospitals for lepers, some deep wells were found, in which were pumps that had evidently been there several hundred years, as they were formed of hollow trees sunk in the wells.—In the course of making the new street from Farringdon-street to Clerkenwell, two houses in West-street, Smithfield, have been brought into notice, and have attracted so much curiosity, that among numerous other persons the Duke of Cambridge and some members of the Cabinet have paid them a visit. The houses (Nos. 2 & 3) communicate with each other, and are at the west side of Fleet-ditch. The latter house, said to have been the residence of Jonathan Wild, was kept as a chandler's shop by way of lulling suspicion: immediately behind the counter were the trap-doors, one of which was used as a means of escape, the other opened into secret drawers, or depositories for stolen articles. Passing down the larger trap the pursued could elude the police by getting through a window and crossing Fleet-ditch over a plank which was kept at hand, and afterwards drawn into the opposite house. The pursued might then pass into Black Boy-alley, and thereby get into Cow-cross, and the numerous courts and alleys in that neighbourhood. Immediately under the basement there is a capacious dark cellar, evidently constructed for the purposes of concealment. A skull and some human bones were found here, and given over to the police. The top of a butcher's steel has also been discovered, which has studded in silver letters the following upon it:—"Benjamin Turtell, July 19, 1787." At the western extremity of the cellars is a parting wall, which, on being searched, left no doubt that there is another secret chamber beyond this portion of the premises, but owing to some legal difficulties, this part of the houses has not hitherto been explored. Upon the first floor of the buildings are several hiding-places ingeniously contrived. Numerous traps are made in the floorings, and leave a direct communication with the cellar on the back of Fleet-ditch; and a spout running the entire length of the house is so constructed that stolen property could be removed with the greatest despatch, and the offenders escape over the roofs of the houses, which are connected by means of a drawbridge. A private still had been fixed in the basement story, and there is no doubt that some curious discoveries will be made on a closer examination of the premises. Up to the last Middlesex sessions the houses were inhabited by persons of dishonest and abandoned habits, but by the active measures of the Commissioners appointed to carry out the intended improvements in this neighbourhood, possession was obtained of the property on compensating the freeholders.

New Zealand Company.—A special general meeting of this company was held last week at the New Zealand House, for the purpose of considering the state of their affairs. The chair was taken by Joseph Somes, Esq., the governor, supported by Mr. Aglionby, M.P., Sir R. Howard, Bart, M.P., Mr. Majoribanks, M.P., Lord Ingestre, M.P., Mr. Hutt, M.P., Alderman Thompson, M.P., Sir John Pirie, Bart., Mr. Gibbon Wakefield, and other proprietors. The Secretary read the report of the directors, which commenced by quoting at length the report of the select committee of the House of Commons appointed to inquire into the state of New Zealand, and the proceedings of the company, a document of considerable length. The report of the directors then proceeded to say, amongst other matters: "Of the fifteen members composing the committee, only one, Mr. Aglionby, is in any way connected with the company; and ten, or two-thirds of the whole, are general supporters of the present Government. It is obvious, therefore, that whilst her Majesty's Government deliberately referred these questions of policy and right to a select committee of the House of Commons, that tribunal was so composed as to preclude the possibility of an award favourable to you on any other ground than the manifest justice of your case. Concerning what may be the immediate result of this verdict in your favour, we cannot afford you any information at present; but, whilst we entertain the hope that Lord Stanley will be generously disposed to forget the unhappy differences with his lordship's department, which have been so fatal to the settlers in New Zealand, and to your usefulness as a colonising body, and to place the company on a footing of relations with the Colonial Office and the local government, which would enable us to carry out with immediate effect the objects of your incorporation, we feel it to be a duty which we owe to you, and still more to the suffering colonists, to act on the result of this inquiry by the House of Commons, so far as may be in our power; to banish all thought of allowing the company to be broken up by the adverse circumstances in which it has been placed; to resume, as far as your resources will allow, the colonising operations of the company; and to rely for complete success, sooner or later, on that support from public opinion which was constantly extended to you whilst our difficulties were not concealed from you, and which in this free country is the best dependence of a just cause." The directors, in conclusion, recommended the adjournment of the meeting for a fortnight. The Report was then unanimously adopted, and the adjournment was agreed to.

South Sea Company.—A meeting of the proprietors of South Sea Stock was held last week, and numerously attended, and the proposition of the Chancellor of the Exchequer for the completion of the Guarantee Fund received with almost unanimous consent. There was evidently, however, an inclination to listen to the question of dissolution, both on account of the convenience of the public and the benefit of holders of South Sea Stock, since the presumption was, that, notwithstanding the interest on the Guarantee Fund, now it is completed, would yield 18,000*l.* a year, which was stated to be amply sufficient to pay the dividend of 3½ per cent. and all expenses, still the loss to the proprietors by the maintenance of the establishment would, nevertheless, be 6000*l.*, or the difference between the 3000*l.* received from Government and the 9000*l.* payable in salaries, &c.—a loss the proprietors seem little disposed to encounter. It is reported that the matter will not end here, but that a body of the proprietors intend memorialising the Government for the dissolution of the Company.

The Custom-house Frauds.—Considerable excitement prevailed at the Custom-house on Monday, and amongst the numerous merchants and agents in the neighbourhood, in consequence of a rumour that a firm in the city, who have transacted business as Custom-house agents for many years, and have hitherto been considered of irreproachable character and probity, have decamped, in consequence of the searching investigation at present taking place into the official books at the Custom-house for several years past.

The Ioway Indians.—A numerous "delegation" from a tribe of Indians that hunt over a tract of land near the Upper Missouri, bordering on the Rocky Mountains, have arrived in this country, and are exhibiting at the Egyptian Hall their native costumes, games, and dances, under the superintendence of Mr. Catlin. These Indians are fourteen in number, their head is the principal chief of the tribe, "White Cloud," and the youngest is only six months old.

Caledonian Asylum.—A special general meeting of the subscribers to this Asylum was held on Monday, the Duke of Buccleuch in the chair. A long discussion arose on a question raised by Mr. P. M. Stewart, M.P., and the seceders, whether the schoolmaster of the Institution should belong to the Established Church of Scotland, or to the Free Church. After a boisterous discussion on the rejection of certain reports of a committee on the subject, Mr. Stewart moved that in that portion of the report which spoke of the schoolmaster, that these words should be introduced—"That the schoolmaster shall be an orthodox Presbyterian, ready to subscribe to the Westminster Confession of Faith." The Marquis of Bute said that the object was clear, and not to be misunderstood. When they talked of an orthodox Presbyterian who subscribed the Westminster Confession of Faith, they talked of what was entirely unknown to the constitution of this country and to the people of Scotland. Mr. Dallas, The Chisholm, and other gentlemen opposed the Free Church party, and on a division Mr. Stewart's motion was defeated by 25 to 19.

University College.—The result of the late Botanical Examination of University College was as follows:—SENIOR Class, 1843-44, *Gold Medal*, Mr. John Owen Evans; *Silver Medal*, Mr. George H. Bailey. *Certificates of Honour*: 3d. Mr. E. P. Watkins; 4th. Mr. W. Clap, and Mr. James Morris, equal; 5th. Mr. George Annis; 6th. Mr. John Rowe; 7th. Mr. W. Filliter; 8th. Mr. C. W. Randell; 9th. Mr. F. J. Gant.

Anti-Corn-law League.—On Wednesday night the 24th and last meeting of the League for the present session took place in Covent Garden Theatre, which was crowded in all parts. The chairman, Mr. Wilson, presided, and addressed the meeting on the events of the past session: after which the meeting was addressed by Mr. M. Gibson, Mr. Cobden, and Mr. W. J. Fox.

Wandsworth.—On Monday week, a woman about 26 years of age, named Amelia Alfred, left her home at the water-side, Wandsworth, with her two children, a girl and boy, aged six and four years, and proceeded to Wandsworth-common, where she wandered about for nearly an hour, and then approached a large and deep pond called the "Black Sea." It would appear that whilst standing on the margin of the pond she tied the two children to her waist, and then precipitated herself into the water. The bank was shelving, and the water was shallow at that point, but she was so determined upon making away with herself and her offspring, that she afterwards threw herself on her back, so that the water covered both the children and herself. At this critical period, the brother of the unfortunate woman, a lad not more than 14 years of age, ran up to the spot, jumped into the water, and tried to rescue the children. Finding that he could not release them, he held their heads above water, and holloed for assistance. Mr. Alexander and his lady were walking on their lawn, which is adjoining the pond, and hearing the boy's screams, Mr. Alexander instantly surmised that some one was in the water, and taking his gardener with him, ran to the pond. The lad was still keeping the children's heads above water, but appeared ready to drop from exhaustion. The gardener jumped into the water, and with his knife severed the handkerchief, and released the children from their perilous situation. They were not seriously injured, and were kindly taken charge of by Mrs. Alexander, and conveyed by that lady to her residence. The unfortunate woman when taken out of the water was to all appearance dead; she was conveyed, however, to the Wandsworth Union, and has since recovered so far as to undergo an examination before the magistrate, who has committed her for trial. There is little doubt that the woman is insane, and that insanity has been brought on by the ill-usage of a man called Henry French, a journeyman carpenter and cabinet-maker, the father of her children.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending August 3rd.—West Districts, 147; Northern, 202; Central, 220; Eastern, 204; Southern 241; Total, 1014. Weekly average for the last five years, 946.

Provincial News.

The Late Hurricane.—Information has been received at Lloyd's, and the various maritime insurance offices in the city, of a dreadful hurricane having visited the different ports on Saturday and Sunday last, which was attended with a frightful sacrifice of human life, as well as a great loss of property. It appears to have been extremely violent on the coast of Wales, along the coasts of Devon and Cornwall, and on both sides of the English Channel. Several vessels were lost, and in many instances their crews were drowned. At several other places a great deal of wreck has been washed ashore, leaving no doubt that we shall hear of many more disasters occasioned by the storm.

Cambridge.—The *Cambridge Independent* states that on Wednesday week a horse belonging to Mr. Uppinden, farmer, of Haddenham, strayed from his yard into the garden of Mrs. Cox, adjoining, where he kicked down a hive of bees, which instantly attacked him with great fierceness. The horse kicked and plunged violently, and a man named Blunt, a shepherd, who happened to be in Mrs. Cox's house, went to its rescue. He succeeded in getting hold of the horse, but had scarcely done so when the bees attacked him, covering his head, face, and every exposed part of his body. It was in vain he strove to beat them off. Wet clothes were flung over him, and other appliances resorted to, but it was a long time before the bees left him. The unfortunate man was conveyed to his home, but died on his way thither, within ten minutes of the attack, and the horse died the next evening.

Exeter.—On Friday, the extensive tallow-stores of Mr. Tuckett in this city, and 20 adjoining houses, were destroyed by fire; the loss of property is said to be at least 10,000*l.* The proprietor was insured.—On Wednesday week a destructive fire broke out at Colyton, near this city, which totally burnt down one of the most antique structures in that part of the country, called Blamphayne House, the seat of Sir E. M. Elton, tenanted at the time of its loss by a gentleman named Parry. Within an hour after the discovery of the fire the building was reduced to ruins. The loss is very considerable, and it is understood that the house was not insured.

Gravesend.—Another extensive fire occurred in this neighbourhood on Wednesday afternoon. It broke out in a labourer's cottage at Lower Shorne, and after destroying several adjoining houses, the flames spread to the extensive farm of Mr. Solomon, and burnt down his granaries, barns, and other buildings. The adjacent crops of corn were saved with great difficulty. The damage will probably amount to 15,000*l.*, the burden of which will fall upon the Norwich Union.

Ipswich.—On Sunday night, the 28th ult., James M'Faddon, a constable belonging to the rural police, stationed at Kessingland, when going round his beat, observed some men approaching the farmyard of Mrs. Button, which adjoins the road. From the silence of the party the constable was induced to watch their movements, and having seen them enter the barn he advanced for the purpose of securing one of the party, a man named Howell, when the robber shot him. He lingered till the next day, when he died, and the man Howell has been committed for trial on the charge of wilful murder.

Jersey.—On Tuesday afternoon the cutter Laurel, belonging to Mr. Edward Le Vesconte, and commanded by Capt. Pallot, left Gorey about noon on a (so called) wrecking party, but, in reality, one of pleasure and merry-making, and consisting altogether of 20 persons. Upon rounding that dreadful bed of rocks, the Banc du Violet, whether by the violence of the sea and wind, which had both begun to rage tremendously, or by either the unwariness or recklessness of the captain, who was at the helm, the boat was driven against the Ponchière rock, and immediately became a wreck. By means of 3 wrecking boats, which were at hand, 12 of the party were placed upon the rock, and two others clung to the wreck. In a few moments the 12 on the rock were swept off by the waves, and before any assistance could be rendered the two others who clung to the wreck, one of whom was a lady, Mrs. Le Boutillier, sank from exhaustion and perished. The six others had been picked up by the wrecking-boats and drifted out to sea, but were eventually brought safely to land.

Liskeard.—The Bishop of Exeter last week gave judgment in a proceeding instituted under the Church Discipline Act by Mr. B. Hart Lyne of this town, against the Rev. J. F. Todd, Vicar of the parish, for having, in the burial of Mr. Lyne's brother, omitted from one of the prayers the words "as our hope in this our brother doth." The Vicar defended the omission on the ground that deceased died in a state of intoxication, but having found that this was not the case he expressed his sorrow and submitted himself to the Bishop. In consequence of his submission, the Bishop said he should pass

a lenient sentence, which was that Mr. Todd be suspended from all clerical duty in the diocese for 14 days after this judgment had been publicly read in the parish Church of Liskeard, and be also condemned in the costs of the suit.

Lincoln.—On Friday morning Eliza Joice suffered the extreme penalty of the law for the wilful murder of her two children, Eliza and Ann Joice, at Boston, in this county, by administering laudanum. It being market-day there were upwards of 5000 spectators.

Manchester.—Another calamity by fire occurred here on Monday night, whereby a large new pile of warehouses and their valuable contents have been entirely destroyed. The property in question, known as the Irwell Buildings, comprised the warehouses of Messrs. Charlton and Sons, calenderers and packers, Mr. Rostron, merchant, Mr. Garsen, Mr. Jacquet, Mr. Ralli, Mr. Fiescher, Mr. Helsted, and Mendel, foreign merchants. The warehouses were six stories in height, had been but recently built, and like all those of modern construction in this town, contained a great quantity of wood. After burning for some hours the principal portions of the warehouses fell in, by which one man was killed and another seriously injured.

Plymouth.—A court-martial, ordered in consequence of representations from the French Government, was held at this port last week on Lieut. Gray, of the Bonetta brigantine, for his alleged misconduct in boarding and searching the French vessel Luiz d'Albuquerque, on the coast of Africa. That officer chased a vessel which bore every appearance of being—and was—a slaver. He had sufficient reason to mistrust the colours which she hoisted, and sent an officer on board, as he asserts, to ascertain their truth. "I ordered," he says, "in the usual way, the second in command to go on board the French vessel, and examine her papers strictly." The second in command—Lieut. Bullock, says, "I took the cutter under Lieut. Gray's directions, with a crew of eight men, three officers, and myself, to board and search the vessel." This evidence was considered to connect Lieut. Gray with the illegal act of instituting an unauthorised search, and although the evidence of the other witnesses proved that the vessel was a known slaver, and that Lieut. Gray did not receive the Admiralty warrant until four months after the occurrence, the court decided that the accusation of "disobedience to orders," in detaining and searching the Luiz d'Albuquerque, had been substantiated, and as guilty of this and (in part) of the third charge, sentenced Lieut. Gray to be severely reprimanded, and cautioned him to be more particular in giving orders for the future. This result is said by the daily papers to have astonished all who heard the evidence.—On Tuesday, the Commander-in-Chief, Sir D. Milne, proceeded on board the St. Vincent, and having ordered all hands to be turned up, read her Majesty's reprieve for the convict Noble, who had been condemned to death by a court-martial, for stabbing Mr. Protheroe, a midshipman of the Madagascar. The sentence has been commuted to transportation for life.

Rochester.—The local magistrates on Monday, after a long and painful examination, committed Richard Dadd for trial for the murder of his father in Cobham Park. The young man was removed to Maidstone gaol, but it was said that the bench were quite convinced of his insanity, and there is little doubt that the last public scene in this melancholy tragedy has closed, and that the unhappy maniac will be transferred to a lunatic asylum, without being put on his trial.

St. David's.—The Dean and Chapter of St. David's have ordered the pews in the nave of the Cathedral to be removed, and the whole nave to be thrown open, and benches of oak substituted.

Wakefield. — Some time since an advertisement appeared in the *Manchester Guardian*, setting forth that the advertiser was in want of a wife. A gentleman of Wakefield, conceiving that the announcement emanated from some fortune-hunter, took upon himself to write to the specified address, pretending to be a lady of fortune, who had never been able to meet with a being whom she could "promise to love, honour, and obey," averring that the man who would be able to gain her heart, must be able to discourse eloquently on literature, science, &c. The bait took, and a few posts brought a letter, bearing the Liverpool postmark, and addressed "Miss Sophia B., Post-office, Wakefield." A correspondence ensued, carried on by the assumed lady in an apparently *bonâ fide* spirit, and by the wife-hunter in a bombastic style. The result was that an interview was appointed to take place on Friday week, at Wakefield, and the gentleman promised to appear in his usual dress—a suit of black—or, that he might bear a more distinguishing sign, he would wear a light vest, have either a rose in his breast or a book in his hand, and be accompanied by an old friend in the shape of a stick. True to his appointment, the gentleman presented himself, and paraded the churchyard for about 20 minutes, to the great amusement of a number of parties in the secret, who had posted themselves in the windows of the neighbouring shops and hotels. As the lady did not appear, he then, in accordance with the arrangement previously made, went to the post-office, found a letter excusing and accounting for her absence, and declaring that on the following morning she would meet him at all risks. Although the whole correspondence appeared on that morning in the *Wakefield Journal*, he again kept the appointment, and, after having been followed by a crowd, who enjoyed the joke, he found out the trick, much to his discomfiture. The gentleman is a resident of Liverpool.

Worcester.—On Monday evening 12 of the navigators employed in the Severn improvement were drowned while crossing the water at the works, a mile below this city. They rushed into a flat-bottomed boat for the purpose of crossing the river, and when in the middle of the stream the boat upset. There were 15 in the party when they entered the boat, and 12 of them were drowned.

York.—The local committee have issued circulars from the "Museum, York," to announce the forthcoming meeting of the British Association, to be held in that city, commencing on the 26th September, which is six weeks later than the time appointed for last year's meeting at Cork.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3372*l.*; Bristol and Gloucester, 1015*l.*; Eastern Counties, 5044*l.*; Edinburgh and Glasgow, 2458*l.*; Grand Junction, 9165*l.*; Glasgow, Paisley, and Ayr, 1620*l.*; Great North of England, 1955*l.*; London and Birmingham, 20,740*l.*; South Western, 13,505*l.*; Blackwall, 1701*l.*; Greenwich, 875*l.*; Brighton, 5276*l.*; Croydon, 620*l.*; Liverpool and Manchester, 6533*l.*; Manchester, Leeds, and Hull, associated, 8313*l.*; Midland, 11,376*l.*; Manchester and Birmingham, 3511*l.*; Newcastle and Carlisle, 1960*l.*; Newcastle and Darlington, 863*l.*; South-Eastern and Dover, 5743*l.*; Sheffield and Manchester, 757*l.*; York and North Midland, with Leeds and Selby, 3001*l.*—A meeting of the inhabitants of Peterborough was held last week for the purpose of discussing the merits of the London and York line of railway. Earl Fitzwilliam, who presided, observed that, looking at this measure as a public man, he felt convinced that it was one which would at once be advantageous to that neighbourhood and to the nation at large. Not less than 90,000 fat sheep and 6000 bullocks passed annually through Peterborough on their way to Smithfield, and the carrying of such an immense quantity of food to the metropolis of itself proved that this was a national undertaking, and for that reason he should support it. A general resolution in favour of a direct line of railway between London and the North was then moved, and carried unanimously. Mr. Denison, M.P., next addressed the meeting, and alluded especially to the facilities which the line would afford for the conveyance of agricultural produce from Lincolnshire, and to the benefit which would result. A resolution pledging the meeting to support the London and York Railway was then unanimously agreed to. A similar meeting in favour of the line was held on Friday at Huntingdon.—The general meeting of the Eastern Counties Company was held on Thursday. The report showed an increase in the receipts, and proposed a dividend of 4*s.* per share on the new shares, and 3*s.* per share on the old shares. The chief business of the meeting was to consider a modification of two plans authorised at former meetings. The original schemes were to extend the Cambridge line northward to Lincoln, and the Hertford branch to Hitchin and Bedford. Now however (according to the report), arrangements have been made with the London and Birmingham and Great Midland Railways, by which the traffic north of Doncaster will be transferred to the Cambridge line, and also a portion of the general northern traffic from places beyond Doncaster. For this purpose a line is to be made by the Great Midland Company by way of Doncaster, Lincoln, Boston, and Spalding, to March, at which latter place it is to join the Ely and Peterborough line of the Eastern Counties. A deviation of the Parliamentary line between Ely and Peterborough to March will be necessary for the purpose. The London and Birmingham Company having undertaken to construct a branch from Bletchley to Bedford it had been agreed on the part of the Eastern Counties that the proposed branch from Hertford should not proceed so far as Bedford. These modifications were submitted to the proprietary, and unanimously adopted.—On the same day the Northern and Eastern Company held their meeting. The report stated that the agreement with the Eastern Counties, for the amalgamation of the interest of the two companies had received the sanction of Parliament, and that the arrangements were progressing to completion. The substance of the agreement was, that the shareholders of the Northern and Eastern should receive five per cent. in perpetuity on their paid-up capital, with certain prospective advantages. The traffic for the half-year amounted to 43,264*l.* 4*s.* 3*d.*, being an increase on the corresponding half-year of 21¾ per cent.; thus confirming the estimate upon which the agreement with the Eastern Counties was based. The cost of the line, the directors were satisfied, would not exceed the maximum of 970,000*l*, and in order to close the account as soon as possible, it would be requisite that the 1068 shares in the hands of the company should be disposed of, and the directors proposed that they should be sold by tender to the highest bidder. The report was unanimously adopted.—At a private meeting of landowners and others, held at Theale on Friday, to consider the proposed branch for the Great Western to Newbury, the landowners stated that if a line could be selected from Newbury to Reading, instead of Pangbourne, their objections might be waived. The whole meeting appeared to coincide with this view; and it was stated by the representatives of the Great Western, that they would endeavour to obtain a bill for a branch diverging a little to the west of the Reading station, crossing the Oxford and Bath roads, thence through the Southcot estate, and proceeding towards the Kennet, whence a junction with the South Western at Basingstoke is to be surveyed; the Newbury branch to continue as close to the Kennet as possible all the way to Newbury, thus avoiding the ornamental property of the numerous seats on both sides of the Bath road. It was further suggested that there should be stations at Theale, Aldermaston, and between that village and Newbury. The Basingstoke branch is to leave Burghfield hill on the right, and proceed by way of Strathfieldsaye.—A meeting of the supporters of a railroad to Falmouth, in connection with the South Devon, was held on the 6th inst. at Truro, at which the Earl of Falmouth presided, supported by Sir C. Lemon, M.P., Mr. Pendarves, M.P., Mr. Turner, M.P., and many other gentlemen of the county. The report of the provisional committee was read, which gave a summary of its proceedings since the time of its appointment in Jan. last, and embraced Capt. Moorsom's report of his survey, and Mr. Bond's report on the the traffic to be expected, which was founded on actual observations during 14 successive days and nights, at 23 stations between Plymouth and Falmouth. In calculating the amount of traffic deduced therefrom he had the assistance of Mr. Fisher, who was employed by the Great Western Company to ascertain the traffic on the South Devon line. These investigations make it appear that the undertaking will yield a handsome per centage on the capital required; and the meeting authorised the committee to take the needful steps to insure the construction of the railway at the earliest possible period. The meeting separated under the persuasion that the bill will be applied for in the next session of Parliament.

IRELAND.

Dublin.—The Lord-Lieutenant has recovered from his recent indisposition, and was well enough to attend Divine Service at the Chapel Royal on Sunday. The provost, fellows, scholars, and a number of the students of Trinity College, presented an address on Monday to the Lord-Lieutenant. His Excellency received them standing before the throne, accompanied by his aides-de-camp and private secretary. The Rev. Dr. Moore then read the address, which was written in Latin, and to which his Excellency replied in English. After stating the pleasure he felt at receiving an address from a university whose fame was known throughout Europe, he expressed his determination to use his best efforts for the promotion of religion, and for diffusing the blessings of education among all classes of Her Majesty's subjects in this country. The answer concluded by stating that it was his Excellency's desire to carry out Her Majesty's intentions by promoting peace and good-will among all classes.—It is rumoured in Dublin that the Duke of Devonshire is about to sell his Irish estates, and that his Grace's visit to that country is connected with this object.—The Earl of Devon and others of the land commissioners have been cruising on the western coast, and have visited Achil Island and other curiosities of the west in the course of their voyage.—The weekly meeting of the Repeal Association took place on Monday in Conciliation Hall, Alderman Arabin, Lord Mayor elect, in the chair. The proceedings presented few topics of general interest. The principal contributions were from America. Mr. D. O'Connell, Jun., said his father was never in better health, and exhorted the people to patience and tranquillity, assuring them of ultimate success. Tahiti and Morocco were matters in their favour; the time might soon come when England would want the aid of Ireland, and then was Ireland's opportunity—then the stalwart arm and brave heart of Ireland would be wanting—and then the time for agitation will have arrived. After a long speech from Mr. Grattan, the rent for the week was announced to be within a fraction of 1,400*l.*

Galway.—Peter Larkin, an aged pensioner from the 87th Regiment, was tried at the recent Assizes in this city, for the murder of two of his children, and acquitted on the ground of insanity.

SCOTLAND.

Edinburgh.—On Wednesday the Presbytery of Edinburgh appointed the 15th inst. as the day for the induction of Mr. Smith, of Penpont, to the Tolbooth Church in Edinburgh. The Presbytery of Penpont agreed unanimously to the translation or "transportation," as the legal phrase is in Scotland, and this case, which threatened another quarrel in the kirk, is now in a fair way of being settled.

Ayr.—Tuesday being the day fixed for the celebration in honour of the memory of Robert Burns, and to welcome his sons to the Banks of Doon, great preparations were made for the occasion. Multitudes flocked into Ayr from the surrounding districts and remoter quarters of Scotland—many strangers from England and Ireland joining in the demonstration. The masonic and other bodies marshalled on the green, and at eleven o'clock the procession, extending to several miles, with music and banners, moved towards Burns's monument, about three miles distant from Ayr. Here they filed before Lord Eglinton, Professor Wilson, and other members of the committee, three sons of the poet being present. The spectacle was animated and impressive in the highest degree, and was witnessed by the immense concourse of spectators amidst every demonstration of enthusiasm. At two o'clock, about 1800 ladies and gentlemen assembled in the pavilion erected for the occasion, in a large field opposite the monument, and in the very midst of the scenery so beautifully described in the poetry of Burns. Lord Eglinton took the chair, supported by Mr. Robert Burns, the poet's eldest son, Col. Burns, and Major Burns, the other sons of the poet. After the usual loyal toasts, the Chairman proposed the memory of Burns in an appropriate address, which called forth reiterated bursts of applause. Mr. Robert Burns returned thanks briefly but feelingly for the honour done to the memory of his deceased father. Professor Wilson, in a speech which occupied nearly an hour in the delivery, entered into an elaborate expo-

matter of the character and genius of Burns, and concluded by proposing a welcome home to the sons of Caledonia. The toast was drunk with great applause. Mr. Peers, The toast was drunk with great applause. Mr. Peers, The toast was acknowledged the toast in appropriate terms, and the meeting was afterwards addressed by Sir J. M'Neill, Mr. Ahson, Mr. Aytoun, Col. Mure, the Lord Justice General, &c. The company broke up about six o'clock. The weather up to five o'clock, although broken and showery, was sufficiently propitious for giving full effect to the demonstration. At that hour, however, the rain began to fall heavily, and continued to do so till the whole multitude had dispersed.

Miscellaneous.

Post Office Espionage.—The Reports from the Secret Committees of both Houses of Parliament have been published this week. The Report of the Lords is very short. It states that the investigation of the Committee was confined to the general practice of the Post-office until 1822, and that the power of opening letters was given by statute in the reign of Queen Anne, and recognised in subsequent reigns; and that since 1822, 182 warrants have been issued, averaging about eight per annum. These were generally for the purposes of justice. But "a second class of warrants" have been issued at periods when the circumstances of the country have seemed to threaten public tranquillity. The warrants for detention of letters of this class have scarcely, upon an average of 21 years, exceeded two annually in Great Britain; and though under some of the warrants not a single letter has been opened, under others many have been detained and examined. The Report says—"It does not appear that from any one of these letters specific knowledge of great importance has been obtained," but "it is the concurrent opinion of witnesses who have held high office, and who may be most competent to form a sound judgment, that they should reluctantly see this power abolished." The power of issuing warrants, which was first granted by the Irish Act, 23 and 24 Geo. 3, to the Lord Lieutenant or other Chief Governor or Governors of Ireland, has been very sparingly used, and the number issued does not average more than two annually, and these have been principally for the detection of suspected criminals. The committee state that they have examined into the case of the petitioner whose petition has been referred to them. "It is true that Mr. Mazzini's letters were for about four months stopped and opened, under the warrant of the Secretary of State for the Home Department, and inspected by the Secretary of State for Foreign Affairs, upon an apprehension that he was engaged in a correspondence having for its object designs which might be injurious to the tranquillity of Europe. Certain parts of the information thus obtained were communicated to a foreign government, in so far as such a communication appeared to be warranted, but without the names or details that might expose any individual then residing in the foreign country to which the information was transmitted to danger." In conclusion, they add that "it appears to have for a long period of time, and under many successive administrations, been an established practice, that the foreign correspondence of foreign ministers, passing through the General Post-office should be sent to a department of the Foreign-office before the forwarding of such correspondence according to its address. The Postmaster-General, having had his attention called to the fact that there was no sufficient authority for this practice, has since June discontinued it altogether." The report of the Commons is very much fuller than the report of the Peers. The Commons committee give a succinct and curious history of the origin of the British Post-office, and trace the rise and progressive exercise of the power of opening letters on official authority and statutory power. Indeed the report, in this respect, is a valuable historical paper; and the facts disentombed from the public records have hitherto been unknown. The Rolls, the Privy Council, and the State Paper offices have furnished these valuable materials of the Commons' report, which, in its ample and critical details, is a remarkable contrast to the report of the Lords. The Commons' committee further supply all the data and details of the general statements in the Lords' report. Tables are given of the number of warrants annually signed, and also a list of the different Secreraries of State who, in successive Administrations, have signed warrants. These tables, in the relative numbers of each year, indicate the particular occasion which caused any excess of average—such years, for instance, as the social disturbances in Lancashire during the last quarter of a century, and the more recent outbreak at Newport. The number of warrants issued from 1799 to 1844 was 372, being an average of little more than 8 warrants a year, and about two persons on an average for each warrant. In 1839 there were 16 warrants issued by Lord J. Russell and Lord Normanby; in 1840, 7 by Lord Palmerston; in 1841, 18 by Lord Normanby and Sir J. Graham; in 1842, 20 by Sir J. Graham; in 1843, 8 by Sir J. Graham; and in 1844, 7 by Sir J. Graham and Lord Aberdeen. With regard to Mr. Mazzini, the report states that a representation had been made to the British Government, from high sources, that plots, of which Mr. Mazzini was the centre, were carrying on upon British territory to excite an insurrection in Italy, and that such insurrection, should it assume a formidable aspect, would, from peculiar political circumstances, disturb the peace of Europe. The British Government considering the extent to which British interests were involved in the maintenance of that peace, issued on their own judgment, but not at the suggestion of any foreign power, a warrant to open and detain Mr. Mazzini's letters. Such information deduced from those letters as appeared to the British Government calculated to frustrate this attempt was communicated to a foreign power; but the information so communicated was not of a nature to compromise, and did not compromise, the safety of any individual within the reach of that foreign power; nor was it made known to that power by what means, or from what source that information had been obtained." The committee in conclusion suggest that the authority for opening letters is now comparatively useless, as there are many other means of rapidly communicating intelligence besides the Post-office, and they leave it to Parliament to decide on the proper measures to be pursued, either for governing its use, or abolishing it altogether.

Law.

COURT OF CHANCERY.—*In re Dyce Sombre—Lunacy.*—This petition to supersede the commission of lunacy issued against *Mr. Sombre* was argued for eight days, and then allowed to stand over in order that his Lordship might have an opportunity of personally examining that gentleman in connection with the physicians. On Thursday his Lordship gave judgment. He began by observing that the case had been argued at very great length, and a great quantity of evidence, consisting of affidavits and documents, was laid before the Court in support of the allegations on one side and the other. He had read and considered them with that attention which the importance of the subject appeared to demand. It was a question with respect to which he had felt much interest and anxiety, not merely on account of its relation to the interests of the individual whose soundness of mind was the subject in question, but also because it was supposed that the decision of that Court, or rather the verdict of the jury on the commission issued, and on the authority of the Court, was at variance with the opinion expressed by medical persons of great skill and science, who, under the authority of the Prefect of Police in Paris, made a report with respect to the state of Mr. Sombre's mind in the month of December last. Two questions, main questions, had been argued. The first, whether Mr. Sombre ever was of unsound mind; whether the finding of the jury could, in fact, on the evidence be supported? and, in the next place, whether, supposing him to have been of unsound mind at that period, he had now recovered his self possession, and was at that moment of sound mind, and in a fit state to be intrusted with the management of his affairs, and with the care of his own person? These questions his Lordship entered into at great length, and after a clear and comprehensive review of all the evidence on both sides, concluded by saying that he could not supersede the commission unless Mr Sombre's recovery were clear and decided; but, adverting to Mr. Lawrence's opinion that such was the condition of Mr. Sombre's mind that he might, if confined, become hopelessly insane, his Lordship said, before he made any final order, he wished to suggest to Mr. Sombre's counsel, that if he was willing to go to Paris or the Continent, in company with any gentleman in whom the Court had confidence, no material impediment would arise to his doing so, and no objection would be made. He would make no order for a day or two, in order that these matters might be arranged, and also that some other person might be associated with the wife as committee of the person. The delivery of the judgment occupied three hours and a half.

SUMMER ASSIZES.—NORFOLK CIRCUIT, NORWICH.—*James Frost*, aged 35, was charged with the wilful murder of his three children on the 8th April last. When called on to plead to the indictment, he said guilty enough in the eyes of the world, but not of God. In early life the prisoner became attached to the Primitive Methodists, and before he had attained to manhood, and before he could read or write, was distinguished among that sect by the zeal and energy of his religious tone and feelings. In the course of a short time he took a decided lead among the congregation, and was esteemed a "powerful preacher." He was esteemed by all who knew him and thought with him. Some of his fellow-workmen devised a scheme to shame him. On one unlucky evening they seduced him into a debauch, and drugging his beer, succeeded in making him completely drunk. The scandal which this affair entailed on his religious pursuits resulted in his dismissal from the pulpit, and he was no longer allowed to preach. This circumstance weighed on his mind and spirits, and deeply oppressed him. He became moody, sullen, and reserved. Soon after this he married, but fell sick of typhus fever, and for seven weeks he was out of his mind. His love for his young wife changed to loathing. He subsequently, however, became more himself, and in this state of things the prisoner's family, consisting of three little girls, grew up around him, and about ten weeks before the 8th April, his wife bore him a fourth. Notwithstanding his delusions, he was a fond and affectionate husband. On the day in question, his wife found him sitting moodily by the fire. A policeman coming in soon after, discovered a bloody hammer in the pantry, with which the desperate man had literally smashed the skulls of his three eldest children. When his master came in, he said to him, when asked whether he had thus butchered his innocent children under an idea that he would get them to heaven, that "he hoped so," and admitted that he had accomplished their death with the hammer. On this he was taken to a neighbouring public house, whence, after the inquest, which terminated in verdicts of wilful murder, he was removed to Norwich Castle. When parting with his friends, who were all in tears, he assumed a look and attitude of joy, and sung "Glory be to God." The evidence of these facts left no doubt of the insanity of the prisoner, who was acquitted on that ground.—*Joseph Paul*, a middle aged man, and of very respectable appearance, was charged with feloniously attempting to administer arsenic to Mrs. Meek and to her household, within the city of Norwich. The prosecutrix is an old lady near 80 years of age, and the prisoner, though nominally her godson, is reputed to be her illegitimate son. Be that as it may, Mr. Paul was always a welcome guest at the house of his connection, which was situated in the precincts of the cathedral, and to all appearances the strongest affection and regard existed between them, and seemed to warrant the conclusion to which the public had long since arrived as to the real situation of the parties. On the 19th of April, Mr. Paul came as usual to pay a visit to his relative, and the cook saw him pass the kitchen window, soon after which she heard the safe-door unlocked and locked. Deeming it an odd circumstance, the cook went into the pantry where she saw the safe-door open, and the prisoner walking from the safe to the kitchen door. An unimportant conversation took place between them, and he quitted the room, but not before she had remarked that his trousers were smeared with a white powder near the pocket. As soon as he had gone away she saw him and the prosecutrix walking arm in arm in the garden, apparently on their usual affectionate footing. Repairing to the safe, the girl found a loin of mutton swinging, as if it had been recently touched by some one, while under it was sprinkled some white powder. Alarmed at this, she examined the meat, and, after a close investigation, satisfied herself that a hole had been made in the joint under the fat, and a quantity of the same powder inserted into it. This discovery she first communicated to her fellow servant, and then to her mistress, but not before she had locked up the meat in the safe. On that evening prisoner came back and took tea with Mrs. Meek, but on the following day the mutton being handed over to chemical analysis and examination, such tests were applied to the powder discovered in it that no doubt whatever remained that it was arsenic, and in great quantity; whereupon, the prisoner was apprehended on the present charge. The jury, after the summing up of the learned judge, who said the question was one of identity, acquitted the prisoner, who, throughout the proceedings, had manifested a wonderful composure and ease of deportment.

NORTHERN CIRCUIT, NEWCASTLE.—*Mark Sherwood*, a gray-haired man above the middle age, and whose face bore traces of habitual indulgence in spirituous liquors, was indicted for the wilful murder of his wife, Ann Sherwood, on the 14th of March last, by cutting her throat. Prisoner had not been living latterly with his wife, who resided at Gateshead, but he returned in the day in question, and a scuffle is supposed to have arisen between him and his wife, which ended in her death. The Lord Chief Baron summed up. The rule of law was that when one person was wilfully the cause of the death of another, he was *primâ facie* chargeable with murder. If, however, the death arises from a blow struck in a conflict commenced without any such intention, and where the party inflicting the blow has been the object of personal violence, in some cases it may be manslaughter. It is not, however, every amount of assault which would reduce the crime to manslaughter. An attack of a grievous character, followed by instant retaliation, producing death, would frequently be of this kind, but in every case the nature of the attack, if any, and the nature of the retaliation must be taken into consideration. The offence would still be murder, if a slight attack were resented with a murderous weapon, such as a knife probably, in the knowledge of the party using it, produce death. No mere words would be a sufficient provocation; but if there was any conflict whatever, the language accompanying it, if of a highly irritating character, and such as would naturally excite a man's anger as much as the most grievous assault, might very properly be taken into consideration. The great question which they had now to consider was, whether they were satisfied that anything occurred on that morning which would bring the present case within the scope of the principles so laid down, and reduce the offence from the higher to the lower class. His lordship then went through the evidence with great care and minuteness. The jury remained in consultation upwards of six hours, and finally returned a verdict of guilty of murder. Sentence of death was passed on the prisoner in the usual form.

WESTERN CIRCUIT, BODMIN.—*Matthew Weeks* was tried for the wilful murder of Charlotte Dymond, in the parish of Davidstowe, Cornwall. The prisoner, who is only 22 years of age, looked sullen and dogged, and on being called on to plead, answered in an almost inaudible voice, "Not Guilty." Prisoner and deceased were fellow servants at a Mrs. Peters's, at Penhall Farm, Davidstowe. Deceased was about 18 years of age, and was possessed of considerable personal attractions. She and prisoner had kept company for some time, and there was reason to believe that he was jealous of her, particularly with regard to a young man named Pront, who had called at Mrs. Peters's on the morning deceased was killed, and had made an appointment to meet her that night at chapel. It did not appear conclusively by the evidence whether the prisoner had overheard this conversation or not, but there was reason to believe that he had. In the afternoon prisoner and deceased came down stairs together, when deceased, addressing Mrs. Peters, said, that she should not be home at working time, but Matthew (the prisoner) would. They then went away together, with every appearance of the most friendly feeling. Mrs. Peters saw nothing more of them until half-past nine, when prisoner returned alone, without deceased. About a mile from Penhall Farm are the Davidstowe Moors, a wild and desolate track, seldom crossed by persons on a Sunday. A farmer named Cory, who knew deceased and prisoner perfectly well, and who had some fields out by this moor, happened to be there on Sunday afternoon in question, for the purpose of looking after some wheat. He saw prisoner and deceased proceed along the road to a place called the Higher Down Gate, which led to the moor, and they were subsequently seen together by another farmer. When the poor girl was missed the prisoner denied all knowledge of her, but on the following Wednesday her murdered body was found in the moor, and when the prisoner's clothes were examined marks of blood were found upon them in several places. The Jury, after a very short deliberation, returned a verdict of "Guilty." The Learned Judge then proceeded to pass on the prisoner the last sentence of the law—that he must die. The prisoner, on hearing his sentence, fainted away, and was so removed from the dock.

MIDLAND CIRCUIT, NOTTINGHAM.—*William Saville*, aged 29, a frame-work knitter, of New Radford, was charged with the murder of Ann Saville, his wife. There were three other indictments against the prisoner, charging him with having murdered Harriet, Mary, and Thomas Saville, his children. The prisoner was a frame-work knitter, and in May was lodging at Radford. His wife and three children had been in the workhouse, but had come out on the Monday preceding the Tuesday, the day the crimes in question were alleged to have been committed. It appeared that Saville had been paying some attentions to a young woman named Tate, and the only motive that suggested itself to the mind for the commission of these murders was, that he wished to get his wife out of the way, and rid himself of the incumbrance of his children. It appeared that when the poor woman left the workhouse with her children, she said she would go in search of her husband, and on the following morning the husband, wife, and children were seen in Nottingham together. On Tuesday evening Saville was heard to say he supposed his wife had drowned herself, and suspicion being excited, inquiry was set on foot and on the Wednesday the bodies were found by a man who went into the plantation to get something for his rabbits, where he saw three little children lying, as he thought, asleep—one had its eyes open. Looking at the girls he saw them wounded—further from them the body of the woman was discovered with her throat dreadfully cut, and a razor in her hand, but quite loose, so that it would appear to have been placed there. The body of the woman was a few yards from the children; she lay stretched, as though dragged; the children lay together. The evidence proved that the prisoner was seen near to and going in the direction of the spot in question with his wife and children on the Tuesday. Two men saw the prisoner, his wife, and children, sitting on a bank within 20 yards of where the bodies were found. The children were gathering flowers. Saw the same man, some time after, come from the plantation alone; as he passed he looked very white. A case of as strong circumstantial evidence was made out as could well be. The Learned Judge having summed up, the jury returned a verdict of "Guilty," and the prisoner was sentenced to death. The prisoner was removed from the dock, not having betrayed the least emotion of any kind during the whole proceeding, unless it was when the young woman Tate was under examination, but even then it was but momentary. He was executed on Wednesday, and the crowd on the occasion was so great that 12 persons were crushed to death, and many others severely injured.—COVENTRY.—*Susanna Jarvis*, aged 13, a girl of mild and rather prepossessing appearance, was charged with having, on the 22d of April last, murdered Emma Goldsby, aged 17 months. The facts of this case lay in a narrow compass, and have been already noticed in this Paper. The mother of the deceased kept the Wheel Tavern, in Coventry, the prisoner acting as nurse-maid. It appeared that a short time previous to the murder she had incurred her mistress's displeasure by bringing the child home covered with scratches, when she was told if she did not take care she should be sent away in a week. On the night of the murder Mrs. Goldsby had placed the baby in a cradle in the kitchen, and had gone up stairs to put another child to bed, when she heard deceased cry, and upon running down stairs she met prisoner coming out of the room. The mother went to the cradle, and taking the child in her arms, found it covered with blood. She called out "murder." She

was met by a person in the passage, who took the child from her and carried it into a room and laid it upon a table. Deceased gasped and sighed twice, and died. The person who had taken the child from the mother, looked to see if there was any nail or other matter over the cradle that might have fallen; while looking about saw a carving knife on the dresser, with fresh blood upon the top part of the blade, the knife being within a yard and a half of of the head of the cradle, so that it could have been reached, the blow struck, and the knife returned to its place without the party striking the blow removing from the cradle. Mr. Goldsby had charged the girl with having killed the baby, but she denied it, saying, "Look at my hands." Her hands were clean, but the front of the pinafore she had on bore several spots of blood upon it. The account given by the prisoner was, that after her mistress had gone up stairs, prisoner went down the yard, and while there heard the baby scream. As she was coming up to see what was the matter, she met a tall man near the end of the brewhouse, without shoes or stockings, but did not think she should know the man again if she saw him. The defence therefore was, that it was not the hand of the prisoner that struck the blow, leaving it to the Jury to infer it was the man prisoner said she had seen, and which man had been traced some distance on the turnpike-road. Mr. Justice Coltman went over the whole of the evidence very carefully, and the Jury retired to consider their verdict, and being unable to agree, they remained in their room all night. On Wednesday morning, upon coming into court, and still unable to agree, the Judge discharged them. The prisoner was remanded back to prison to take her trial at the next assizes. It was said that an uncle of the prisoner was upon the Jury, who had expressed his determination not to convict.

Oxford Circuit, Stafford.—*Wm. Beards* was indicted for the wilful murder of Ann Griffiths, on 16th March. The evidence in the case was very lengthy, and it is unnecessary to repeat it now, the details having been already reported in our Paper. The deceased was housekeeper to Mr. J. Crowther, at Wednesbury, and had been left alone on the premises in the absence of her master, who was a single man. The object of the prisoner was plunder, and having formerly been in the service of Mr. Crowther, he was well acquainted with the premises and the habits of their occupants. The evidence left no reasonable doubt of the prisoner's guilt.—Mr. Sergeant Atcherly then commenced a most careful summing up of the whole evidence. After stating the charge as set out in the indictment, his Lordship reminded the jury that the inquiry was one of great importance; important in all the interests it involved, both as regarded the prisoner and the public; but they must not be deterred by any considerations arising out of its importance from doing their duty. The case rested entirely on circumstantial evidence—no human eye had seen the deed committed. The prisoner knew whether he did or did not perpetrate that deed, but, except the person who had murdered the unfortunate woman, no eye, except that which never slumbers nor sleeps, had witnessed its commission. They could therefore not have any direct evidence upon the case; but sometimes circumstantial evidence was even more important than direct, as affording a chain of testimony, the several links being connected, which was more convincing than any direct single circumstance spoken to by one individual. When they had heard the whole case, with such remarks as he might make on the evidence, it would be for them to say whether, taken altogether, it produced such an amount of conviction as excluded all fair and reasonable doubt; it would in that case be their duty to find the prisoner guilty. Not whether it was a case of strong suspicion—not whether it was a probable case—but whether, when they delivered their verdict, the evidence appeared so strong as to shut out fair doubt, then they must find him guilty; but if it stopped short of this, the prisoner would be entitled to an acquittal.—The jury requested permission to retire, and were absent about three hours and a quarter; on their return they pronounced a verdict of Guilty, and the Judge passed sentence of death. At the close of the sentence the prisoner, who had remained apparently unmoved during its delivery, exclaimed, in a very determined tone, "My Lord, I have been found guilty, but I am as innocent as a child!" On leaving the bar, he struck his hand forcibly on the railing, and added, "I am as innocent as a child, if I was to die this moment." The prisoner was then removed by the officers of the jail. Worcester.—Mr. *John Bowen*, aged 50, was charged with having in July 1843, at the parish of Picton, defaced and injured the parish registers of Croome d'Abitot in in this county. Prisoner was formerly master of a merchant vessel, but had lately been devoted to genealogical researches, and was then engaged in inquiries to prove the title of Mr. John Wood, of Brierley Hill, as heir-at-law to Mr. James Wood, of Gloucester, whose will has given rise to so much litigation. The jury found the prisoner Guilty, and Lord Chief Justice Tindal sentenced him to transportation for seven years.

Home Circuit, Guildford.—*George Hart*, aged 17, and *David Chilton*, aged 17, were indicted for unlawfully setting fire to certain growing heath and furze, the property of Robert Munro. The present indictment was framed under a statute which makes it felony for any person to set fire wilfully to any growing crop of corn, heath, or furze, and subjects him to be transported for seven years, or for such term of imprisonment as the court may direct. Prosecutor was a gentleman residing at Godalming, and possessed a good deal of property in that neighbourhood. On the day mentioned in the indictment, the prisoners were observed by a woman to go up to the furze, and with a lucifer match set fire to it in several places. They ran off, but were pursued, and taken into custody, and on their being searched, a pistol and a quantity of gunpowder were found in the possession of one of them, and upon the other no less than 22 boxes of lucifer matches. The facts were duly proved in evidence, and the jury returned a verdict of Guilty. Mr. Baron Gurney sentenced the prisoners to be transported for 7 years.—*The Bloodstone Case. Herbert* v. *Day*.—This was an issue directed under the Interpleader Act by the Court of Queen's Bench, to try whether a certain colt which had come in the first at the last Ascot races had been foaled in 1842, and was a foal by Bubastes out of Romaike. Plaintiff was a solicitor, at Northleach, near Cheltenham, and defendant was a trainer of horses. Plaintiff was the owner of a colt called Bloodstone, whilst the defendant claimed to be the owner of another colt called Old England. These two colts had both run for the "New Stakes" at the last Ascot races, on the 6th June. Bloodstone came in first, and in the ordinary course of matters was entitled to the stakes; but the defendant, as the owner of the second horse, raised an objection as to its age. The whole interest of the case turned upon the questions of identity and age. It appeared that the mare Romaike had two colts successively, one by Beiram, the other by Bubastes. The whole of the proceedings were very suspicious, and there was strong reason to believe that Bloodstone was in reality the Beiram three-year-old colt, and not the Bubastes colt foaled in 1842. The principal witnesses for the plaintiff were deeply interested in the matter—the horse had been entered for stakes amounting to between 12,000*l.* and 13,000*l.*, and they, of course, felt a strong desire to make out their case. In this, however, they failed, for after a few witnesses had been examined for the defence, all tending to prove that Bloodstone was a three-year-old, the jury stopped the case, and said they were perfectly agreed upon finding for the defendant.—Mr. Baron Parke. I have seen, gentlemen, that you were of that opinion long ago, and I think you could come to no other conclusion.—The foreman said they were of opinion that Mr. Herbert might have been deceived.—Mr. Platt: we believe that to be the case. It is very probable that he knew nothing of the fraud alleged against the other parties.—Mr. Baron Parke expressed his opinion that the jury could come to no other conclusion than the one they had determined upon. The history of the case probably was, that it was the small miserable Beiram colt which died, and that the other was put in its place. The jury then returned a verdict for the defendant.—*The Qui Tam Action. Russell* v. *Lord G. Bentinck*.—Thursday morning having been the day appointed for the trial of the above cause, a good deal of curiosity was created, and a great number of gentlemen connected with the turf were present, and appeared to take much interest in the proceedings. The declaration stated that one John Day did, on the 31st May, 1843, by unlawfully betting on a horse-race, lose the sum of 3000*l.* to the defendant, and that he paid that sum over to him, and that he did not within the period of three months sue the said defendant for the recovery of the money which he had so lost, and that therefore the plaintiff was entitled to sue for and recover from the defendant the said sum of 3000*l.*, and treble the amount, making altogether 12,000*l.* The declaration also stated that one Henry Hill had lost the sum of 3000*l.* to the defendant, and had paid him that amount. The plea put on the record by the defendant was the general issue. Mr. Platt, in stating the case, said that in the spring of last year Day appeared to have entertained a notion that a horse named Gaper, the property of defendant, would not win the Derby, and made two bets on that event, one of 10,000*l.* to 100*l.*, and another of 10,000*l.* to 150*l.* On the morning of the race, however, it seemed that Day was alarmed, for Gaper had very much risen in the public estimation, and became anxious to what was called "hedge" the bets he had made against him. At this time Day stood to lose 20,000*l.* if Gaper had lost the race, and if he won he would only have been winner of 250*l.* Being anxious to diminish his risk, Day applied to a person named Hill, who was known as a betting agent, and eventually Hill laid him a bet of 20,000*l.* to 3000*l.* against the horse, the result being that Day was in the position of losing 2750*l.* if the horse lost, and of winning nothing if he won; and the only advantage he had gained was to diminish his chance of losing 20,000*l.* to only losing 2750*l.* It will be seen that the witnesses necessary to prove the case were Day and Hill, both of whom were interested parties, and therefore reluctant to give evidence. It appeared, however, in the course of a long trial, that Mr. Gully, who was supposed by the plaintiff to be the recognised agent of Day, was not so, but was acting on his own account. Baron Parke then said that this is the state of the case. The plaintiff in this action was to make out that it was with Day, or with Gully as the agent of Day, that defendant made this bet, but Mr. Gully states that he made the bet on his own account. The plaintiff therefore fails in establishing his case. As to the payment of the money, there is reasonable evidence for the Jury to conclude that it was paid. The jury then immediately returned a verdict for the defendant. There was a slight demonstration of approbation, which was instantly repressed.—Maidstone.—*George Plummer*, 50, was indicted for the manslaughter of his wife, by having neglected to provide for her support, and causing her to be exposed to the inclemency of the weather without proper sustenance. It will be recollected that the prisoner was indicted at the winter assizes, 1843, but from some cause or other no one attended to prosecute, and the prisoner was consequently discharged by proclamation. A bill was subsequently preferred against him, and he was brought up to take his trial. The prisoner had filled the situation of gardener to a nobleman in the neighbourhood of Sidcup, and had been separated from his wife for some time before her death, and had made her an allowance of 2*s.* 6*d.* a week. She became, however, in a most destitute and miserable condition, and was found by a policeman late at night, to whom she stated that she had no home to go to. He took her to the prisoner's house, and asked him to admit her, but with offensive language he refused to do so, and the deceased very shortly afterwards died; and from the medical testimony there could be no doubt that her death was occasioned by her state of destitution and want of nourishment. The prisoner, in his defence, said that he and deceased had mutually agreed to separate, and he allowed her half-a-crown a week, which was all he could afford. She had come to him several times in a most filthy condition, and it was impossible that he could live with her. Mr. Baron Gurney then summed up, and said there could be no doubt that in law a husband was bound to provide for and support his wife, and if by neglecting to do so he caused her death, he would subject himself to a charge of manslaughter. The present case, however, presented some peculiar features. It appeared that the parties agreed to separate, and that the prisoner undertook to make his wife an allowance of half-a crown a week, and there did not appear to be any proof that at the time the application was made to the prisoner to admit his wife into his house on the night when the exposure to the weather was said to have caused her death, that he was at all aware she was in a dying condition. The learned judge then went through the evidence, and left the case in the hands of the jury.—After a short deliberation, they returned a verdict of Not Guilty.

SPORTING.

Goodwood Races.—Friday.—*Bathyany Stakes* of 5 sovs each. Three year, 9st 12lb; four, 11st 7lb; five, 12st 2lb; six, and aged, 12st 5lb. Maidstone course. Gentlemen riders. Lord G. Bentinck's Naworth, aged (Lord Maidstone), beat Lord Maidstone's Mechanic, 4 yrs (Mr. P. Williams); Duke of Richmond's Elysium, 4 yrs (Lord Paget), and four others. The first was a dead heat, the second won by a length.—*Nassau Stakes* of 50 sovs each for three-year-old fillies, 8st 7lb each; the second to receive 100 guineas out of the stakes. New mile. (26 Subs). Lord G. Bentinck's All-round-my-Hat beat Colonel Anson's Princess (9lb extra), Colonel Peel's Zenobia, Lord Exeter's Pergularia, and Mr. Gregory's Barricade. Won by half a length.—*Match* 50*l.*, 8st 7lb each. T.Y.C. Lord G. Bentinck's Rose of Cashmere beat Lord G. Bentinck's Olive Oil. Won by ten lengths. Olive Oil was lent by Lord G. Bentinck to Lord Glasgow to make this match, which arose out of a difference of opinion as to the relative merits of the two horses.—The *Chesterfield Cup*, by subscription of 15 sovs each. Craven course. (42 Subs). Lord Chesterfield's Knight of the Whistle, 9st, beat Lord Eglinton's Pompey, 4 yrs, 8st 2lb, and 12 others. Won by a head.—*Maidstone Stakes* of 15 sovs each, with 50 added; three year-olds, 9st 9lb; four, 11st 4lb; five, 11st 13lb; six, and aged, 12st 4lb. Winner to be sold for 500 sovs. Maidstone course. Gentlemen riders, members of the Goodwood Club. Lord Eglinton's Aristides, 4 yrs (Capt. Pettat), beat Lord Chesterfield's Parthian, 4 yrs (Capt. White); Mr. W. Sadler's Idleness, 3 yrs (Mr. Dorrien); Lord Exeter's f by Gladiator (Mr. H. Johnstone); Mr. Hook's Una, 6 yrs (Capt. Peel); Mr. Bowesend, T'Auld Squire, 3 yrs (Capt. Brooke); Mr. Scott's Mosque, 6 yrs (Mr. P. Williams); Lord G. Bentinck's Croton Oil, 3 yrs (Lord A. Lennox). Won in a canter by three lengths.—*March Stakes* of 10 sovs each, h ft, (handicap) for all horses. Gentlemen riders, &c. Last three-quarters of a mile of the D.R.S.C. (8 Subs in each class, and 40 pay 5 sovs each to the winner of the challenge). *First Class.*—Lord Eglington's Quebec, 4 yrs, 11st 6lb (Capt. Pettat), beat Lord G. Bentinck's Vol-au-Vent, 3 yrs, 9st (Capt. Clerk), and four others. Won by two lengths. *Second Class.*—Capt. Harcourt's Sir Abstrupus, 4 yrs (Mr. H. Johnstone), beat Duke of Richmond's The Currier, aged (Lord Paget); Mr. Reeves's Tarquin, 4 yrs, 10st 6lb (Mr. P. Williams), and three others. *Challenge for the March Stakes.*—Lord Eglinton's Quebec, 4 yrs, 11st 12lb (Capt. Pettat), beat Capt. Harcourt's Sir Abstrupus, 12st (Mr. Johnstone); Duke of Richmond's Cornopean (Lord Maidstone), and two others. Won by a length. *Match.*—Mr. Payne's Walpole beat Lord Rosslyn's Elemi by a length.

BIRTHS.—On the 24th ult., at Thun, Switzerland, Mrs. H. L. Phillips, of a son—26th ult., the lady of T. Duffield, Esq., of a daughter—3d inst., at the College, Worcester, the lady of the Rev. J. R. Wood, Canon of Worcester, of a son—4th inst., at Maitland-place, Clapton, Mrs. F. Toulmin, of a daughter—4th inst., at Rhyl, near St. Asaph, the lady of the Rev. H. J. Wharton, of a son—4th inst., Mrs. H. Dursbury, of a son—4th inst., in Montagu-square, the lady of M. Wilson, Esq., of a daughter—4th inst., in St. Martin's-place, the lady of the Rev. R. Cattermole, of a son.

MARRIAGES.—On the 31st ult., at Trentham, by the Archbishop of York, the Lady Eliz. G. L. Gower, eldest daughter of the Duke and Duchess of Sutherland, to the Marquess of Lorn, only son of the Duke of Argyll—1st inst., at Northenden Church, Cheshire, the Rev. C. M. Turner, eldest son of Maj.-General Turner, Commanding the Southern District, Ireland, to Louisa Tatton, fourth daughter of the late T. W. Tatton, Esq., of Withenshaw Hall, Cheshire—1st inst., at Trinity Church, Exeter, J. G. Smith, Esq., of the Manor-house, Crediton, to Emma Brewin, widow of the late F. Brewin, jun., Esq., and youngest daughter of the Rev. J. Savill, late of Colchester—1st inst., at St. George's, Camberwell, John Walsh, youngest son of R. Walsh, Esq., Sydenham, to Eliza A. Stap, only daughter of T. R. Stap, Esq., of the Coast Guard Office Customs—3d inst., by special licence, at St. James's, Ratcliffe, Mr. W. Phillips, Minories, to Rachel East, eldest daughter of Mr. J. East, Commercial-road, Stepney.

DEATHS.—On the 6th inst., Mr. Thos. Rivers, late of the Nursery, Sawbridgeworth, Herts. Nothing can perhaps better exemplify the peaceful and enduring pleasures to be derived from horticultural pursuits than the life of this gentleman. For nearly 50 years his time was devoted to his business as a Nurseryman; and when he retired from active life, the culture of his flower-garden was his constant occupation, in which he took unceasing interest, even to the close of his unchequered, and it may be added, happy life—19th May, in the East Indies, Lieut. W. R. Fullerton, 46th Regiment Madras Native Infantry, eldest son of the late C. Fullerton, Esq., Madras Civil Service, aged 28—9th ult., at Port Henderson, Jamaica, Arch. Harvey, the younger son of Mr. C. Harvey, solicitor—11th ult., at Malta, Susan Holland, the wife of Lieut. Frederick Holland, R.N.—25th ult., at Barnet, Herts, Frances Thimbleby, the wife of Mr. J. Thimbleby, late of Old-street-road, Shoreditch—25th ult., the Rev. J. A. Gabb, 27 years rector of Shirenewton, a magistrate and Deputy Lieutenant of the county of Monmouth, aged 63—30th ult., at Forneth, North Britain, the residence of her sister, Mary Wailes, late of Beacon Banks, near Easingwold, daughter of G. Wailes, Esq.—31st ult., Dora M. Savage, youngest daughter of Mr. J. Savage, of 31, Essex-street, Strand—2d inst., A. Schmaeck, Esq., of Stockwell-common and Jeffreys-square, aged 61—2d inst., at Clifton, Isabella B. C. Parker, only child of the late Edward Parker, Esq., of Brownsholme-hall, Yorkshire.

WANTED, a Steady Active GARDENER.—He must perfectly understand his business in all its branches, including the cultivation of Pines, &c. &c. If a single man he will board in the house; Wages, 20*l.* a year. If married (without a family would be preferred), wages, 18*s.* a week, with a cottage to live in.—Address by letter to A. B., at Mr. May's, Butcher, Royal Hill, Greenwich.

TO MARKET FARMERS.

WANTED, a PARTNERSHIP or SUCCESSORSHIP in a Market Farm, within 10 miles of London.—Direct, with particulars, to G. M., Post-office, Guildford.

WANT PLACES.—All Letters to be post-paid.

TO NOBLEMEN AND GENTLEMEN.

AS HEAD-GARDENER.—A Single Man who perfectly understands his profession in every department; has lived in some of the first situations in the kingdom, viz., at Chiswick and Chatsworth, the seats of His Grace the Duke of Devonshire; also at the Vice-regal Gardens, Dublin, of which place he had the entire management, and has but recently left. The Advertiser would be found an acquisition to any nobleman or gentleman requiring his services; unexceptionable references can be given.—Direct to B. L., 22, Montpelier-row, Brompton, near London.

AS HEAD-GARDENER.—A respectable married Man, aged 38, who understands Pines, Vines, early forcing, all kinds of gardening, land, and stock. His wife could superintend the laundry; they have both lived in most respectable families; have two young children, and quits his present situation through his employer being about to leave England. A character of three years, and a recommendation of several years from his former situations can be given.—Direct to A. B., gardener, Chelsham Lodge, near Croydon, Surrey.

AS GARDENER.—A Married Man aged 24, without incumbrance; he can have an excellent character from his present employer, whom he is about to leave. No objection to a single-handed place.—Direct to E. H. W., at Mr. Ward's, Stationer, Denmark-place, Camberwell, Surrey.

TO GENTLEMEN GOING ABROAD, WEST INDIAN PLANTERS, AND OTHERS.

AS GARDENER, or BOTANICAL COLLECTOR.—A Married Man, aged 30, would be glad to engage with a gentleman going to any part of South America, or Southern Asia, in the above capacities, or in any responsible situation connected with Coffee or Sugar Plantations; he is well versed in the Science of Horticulture, writes a good hand, and is a good accountant: the highest testimonials can be given.—Direct to J. M'E., at Mr. Towerton's, 16, Gloucester-street, Queen-square, London.

AS GARDENER.—A respectable, industrious Married Man, without incumbrance, aged 38, who perfectly understands the Hot and Greenhouse, Kitchen and Flower Garden, early and late Forcing, and does not fear work; would not object to the management of 40 or 50 acres of Grass Land. His wife, if required, is an excellent dairymaid, and understands the management of all sorts of poultry; can with confidence refer for nine years' trustworthy character.—Direct to A. B., Post Office, City Road.

AS GARDENER.—An active and respectable Married Man, aged 40, without incumbrance (a native of Scotland), who has had great experience in all the branches of his profession, including Early Forcing; he is a first-rate Cucumber grower, and understands the management of young plantations, woods, land, &c. His wife has had the charge of large country mansions. He can be highly recommended from the family he has just left, where he had the whole management, and a reference for 20 years. Distance no object.—Direct to L. W., Mr. Garrat, Baker, 19, Harrow-road, Middlesex.

AS GARDENER, or GARDENER and BAILIFF.—A steady, middle-aged Man, who has been nine years in his present situation, and can be highly recommended by the gentleman he is about to leave. He understands Horticulture in all its branches, as well as Farming and the Rearing of Stock.—Direct to G. B., care of Mr. Kearsley, Nursery and Seedsman, Woodhouse Hill, Hunslet, Leeds.

AS GARDENER.—A respectable middle-aged Man, without incumbrance, who perfectly understands his Business in all its branches. Can have an excellent Character from the situation he has just left. Wages not so much an object as speedy employment. Understands the Management of Cows.—Direct to A.B., Mrs. Hands, Montpelier Vale, Blackheath.

8 — Climbers	4 0	Chinese Primrose, mix.	1 6
8 — Alstrœmeria	4 0	Finest mixed Cineraria	1 6
4 — Thunbergia	2 0	— Calceolaria	1 6
3 — Portulaca	1 6	— Gloxinia	1 6
Phlox Drummondii, scarlet	1 0	— Erica	2 6
Ditto, 20 var. mixed	1 0	— Gladiolus	1 6
		— Verbena	1 0
		— Thunbergia	1 0

And most other Flower Seeds contained in his General Catalogue for 1844.

**** *A comprehensive Catalogue of Dutch Bulbs will be published at the usual time.*

J. AND J. FAIRBAIRN, beg most respectfully to acquaint their friends and the public, that they have now many very interesting specimens of HEATHS in flower, which they feel assured will be found worthy of inspection. Open every day, Sundays excepted; admission gratis.—Nurseries, Clapham, near London, Aug. 15, 1844.

MR. LYNE'S NEW SEEDLING GERANIUMS.

WILLIAM E. RENDLE has much pleasure in offering to the Nobility, Amateurs, and Trade the following new varieties of GERANIUMS raised by P. E. Lyne, Esq., the entire stock of which he has succeeded in obtaining.

		£	s.
Lyne's Princess Alice	each	1	1
Lyne's White Perfection	"	1	1
Lyne's Imogene	"	1	1
Lyne's King of Saxony	"	1	1
Lyne's Redworth	"	1	1
Lyne's Confidence	"	1	1
Lyne's Sappho	"	1	1

The whole set as above for six guineas. The usual discount to the Trade.

"Princess Alice" has received two seedling prizes in London. "White Perfection," first prize at Torquay, and the Gold Medal at Plymouth. "Imogene" is described in the *Chronicle*, June 29th, 443. They all possess most desirable properties, and can be highly recommended as being first rate flowers.

W. E. R. has been induced to offer the above at prices considerably lower than usually obtained for such valuable varieties, in hopes thereby to meet with a more extensive demand. Descriptions can be obtained on application.

Orders will be executed in strict precedence. Plants will be delivered in October next. Reference or remittance required from unknown correspondents. Plants will be added to compensate for carriage.—Union Road Nursery, Plymouth, Aug. 15.

LYNDON'S PATENT SPADE.—Sold by Green and Constable, Ironmongers, 36, King William-st., London-bridge. Horticultural Tool Chests, Bright Ladies' Spades, Money's Patent Water Pots, Lord Vernon's Patent Hoes, with a general assortment of Garden Implements.

INGA PULCHERRIMA. (Figured in "Paxton's Magazine of Botany" for August, 1844.)—**Fine Plants of this extremely elegant and beautiful Exotic, with most of the other new and rare Plants of the season, may be obtained of the undersigned, at the following low prices:—**

Inga pulcherrima, 7*s*. 6*d*.
Achimenes picta, 10*s*. 6*d*.
Æschynanthus Horsfieldii, 7*s* 6*d*
Amycia zygomeris, 7*s*. 6*d*.
Clerodendron splendens, 10*s*. 6*d*
" squamatum, 5*s*.
Hindsia, or Roudeletia longiflora, 15*s*.
Epacris campanulata rosea (the finest selected from 1000 seedlings), 7*s*. 6*d*.
Habrothamnus elegans, 15*s*.
Tremandra Hugelii, 10*s*. 6*d*. to 21*s*.
Veronica speciosa, 5*s*. to 15*s*.
Erica elegans, fine and healthy, 15*s*., 24*s*., and 30*s*. per doz.
Drymonia punctata, 3*s*. 6*d*.
Phlox Van Houttei, (flowering plants), 2*s*.
Spirea Reevesiana, 5*s*.
Viburnum cotonifolium, 3*s*. 6*d*.

Also the following, in collections:

100 Cape Ericas of 100 distinct sorts, (including many fine sorts) 5*l*.
12 Epacrises of 12 distinct sorts, (including Campanulata rosea) 21*s*.
12 Azalea indica, of 12 distinct sorts, (including fulgens) 21*s*

Thomas Jackson, Kingston Nursery, Surrey, August 15.

KINGHORN'S NEW SPLENDID CALCEOLARIAS of 1844.

WILLIAM MAY, F.H.S., having been the fortunate purchaser of the entire stock of Five of the best sorts of Calceolarias raised by Mr. Kinghorn this season, and exhibited by him in May last (vide *Chronicle* and *Gazette* of May 25th,—the Editors of which pronounced them as very superior to "Lady Constable" and all others in present cultivation). The Five will be sent out in sets, of which due notice will be given. Parties wishing to possess these splendid varieties to address him at Hope Nursery, Bedale, Yorkshire.

W. M. has at present a fine stock of that beautiful new Exotic DRYMONIA PUNCTATA, which will be sent free on receipt of a Post-office order for 6*s*.; as also SEEDS of his very select varieties of PANSIES, CALCEOLARIAS, and HOLLYHOCK, in packets at 2*s*. 6*d*. and 5*s*. each, post free.

The Seeds may also be had of Mr. Watkinson, Horticultural Agent, &c., Market-place, Manchester, of whom may be ordered the Calceolarias, &c.

N.B.—W. M.'s newly published general Catalogue of Plants, with descriptions of his Calceolarias, Fuchsias, Geraniums, Pansies, Roses, Cinerarias, Camellias, &c. &c. may be had on application.

JAMES DICKSON & SONS, Nursery, Seedsmen, and Florists, in returning thanks to their Customers for many past favours, beg leave to mention that, during the course of the past season, they have opened up a direct correspondence with the principal growers on the Continent of Ornamental and Flowering Shrubs, Greenhouse and Stove Plants, more especially in *France, Switzerland, Germany*, and the Low Countries. They now can offer to their Customers and the Public the finest varieties at a much lower figure than formerly.

J. D. & Sons also beg to state, that they have already received at their Nurseries, Inverleith, a large assortment of the finest new Camellias selected on the spot while the Plants were in bloom; also a great variety of Azaleas, Kalmias, and Calceolarias, which, for their beauty and low prices, are well worthy the attention of amateurs.

32, Hanover-street, Edinburgh.

N.B.—A Large Assortment of the Newest Roses will be received in the course of a few weeks from *France*.

SPLENDID NEW SEEDLING CINERARIAS.

MICHAEL BREWER, Sen., begs to return his best thanks to his numerous friends who last season favoured him with their orders, and to apprise them that in addition to his own extensive List of varied Self and party-coloured new and truly splendid Seedlings of the present year, he made purchase of every new advertised and well-described kind, which having propagated and seeded to great extent, he is now prepared to execute orders for strong seedling plants, fit for furnishing to the Greenhouse, through the autumn and winter months, a varied, lively, and continuance of elegant bloom, comprising every shade of deep rich purple, dark and light blue, &c., at 9*s*. per doz., basket, &c. included. Also seed of the same, which he confidently recommends on account of all being grown mixed together. Mixed and collected in packets, 2*s*. 6*d*. each.

Letters, inclosing post-office orders or stamps, will be immediately attended to.—Nursery, London-road, Cambridge.

T. AND J. BACKHOUSE, Nursery & Seedsmen, York, beg to offer to the notice of the Public their following fine SEEDLING PANSIES:—

Yorkshire Eclipse.—"No. 1 is a large flower, of good form, white ground, blue purple upper petals, and broad margin of the same round the lower petals; the petals meet well above the eye; a good flower." 3*s*. 6*d*.

Beauty of Holdgate.—"No. 2 is your best flower; the eye large and intensely dark, ground light buff, belting purple, upper petals the same: a brilliant and striking flower." 3*s*. 6*d*. See *Gardeners' Chronicle*, p. 250, for 1844.

Earl of Zetland is a flower of excellent form, yellow ground, bronzy crimson upper petals, with broad belting of the same round the lower petals, which meets well above the eye; a distinct and very constant show flower. 3*s*. 6*d*.

Strong plants are now ready for sending out, postage free when three or more plants are taken. A remittance required from unknown correspondents.

THE HAMPSHIRE BROWN COS LETTUCE.—Persons desirous of possessing a very superior LETTUCE during the winter and spring will not be disappointed if they sow the above kind any time this month. Sold by J. and S. Shilling, in ½ oz. packets, at 2*s*. 6*d*. each.

Shilling's Queen Cabbage, which is highly recommended for garden purposes, should be sown immediately, for the autumn and spring planting, ½ oz. packets at 2*s*. 6*d*. each, sent free on the receipt of postage stamps or a Post-office order.

London Agent, Mr. Kernan, 4, Great Russell-street, Covent Garden.

P.S.—To purchasers of the Lettuce Seed the Advertisers take the liberty of recommending a few seeds being kept to sow in the spring, to prove it for the summer.

North Warnbro' Nurseries, Odiham, Hants.

THE NEW SUPERB SEEDLING PICOTEE,
"BURROUGHES'S DUKE OF NEWCASTLE."

YOUELL & CO. have much pleasure in announcing they will send out for the first time the above splendid light-edged purple Picotee, raised by the Rev. J. Burroughes. It is guaranteed to surpass any Purple Picotee that has yet been raised. Without commenting further upon its superiority, Y. and Co. beg to refer to the report of the *Gardeners' Chronicle* of last week, page 548, as follows:—

"The *Duke of Newcastle* is a flower of first-rate properties; it is a light-edged purple; the petals are large, and of good form and substance; even on the edge; the colour unbroken; the pod good, and with less disposition to bar than is common." It obtained the first prize, as the best seedling, at the Norfolk and Norwich Horticultural Exhibition. Price 21*s*. per pair, and will be sent out the latter part of next month. The stock being limited, to prevent disappointment early orders are respectfully requested. Y. & Co. will also be enabled to supply at the same time the following superb Picotees, raised by the same gentleman, all possessing first-rate properties, and having been exhibited and obtained first class prizes at several of the metropolitan Exhibitions of the present year. They are as follows—

			s.	d.
Burroughes's	Mrs. Benyon, R. P.		5	0
"	Lady Alice Peel, R. P.		7	6
"	Miss Jane, P. P.		7	6
"	Miss Bevan, R. P.		7	6
"	Enchantress, S. P.		5	0

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and will be ready for sending out to any part of the United Kingdom and the Continent the latter part of next month, at the following prices:—

			£	s.	d.
12 pairs extra fine and very superior first-class Show Flowers			2	10	0
25	ditto	ditto ditto	5	0	0
12	ditto	ditto Show Flowers	1	10	0
25	ditto	ditto ditto	3	0	0

The selection being left to Y. and Co.

Great Yarmouth Nursery, August 15, 1844.

VALUABLE NEW PLANTS.—The following are confidently recommended as being infinitely the most beautiful of their respective tribes, and worthy a place in all choice collections.—

Achimenes picta, 7*s* 6*d*. to 15*s*. each; Gloxinia cartoni, 5*s*. to 10*s*. 6*d*. do.; Cereus cærulescens, 3*s*. 6*d*. do. The Subscribers feel so confident of this Plant giving entire satisfaction, that they are willing to engage to return the money to all who are not pleased with them. They have also now to offer 12 Plants of choicest kinds of Geraniums, including Duke of Cornwall, Sunrise, Fair Maid of Devon, Lord Eorington, and others equally good, for 21*s*. the 12, or 2*s*. 6*d*. each. 12 most splendid new kinds of Verbena, 6*s*. 12 choicest Fuchsias in cultivation, 10*s*. 6*d*., sent free by post.—R. White and Co., Poole Nursery, Dorsetshire.

THOS. CRIPPS respectfully offers the following New FUCHSIAS at 24*s*. per dozen, reserving the selection to himself, or 30*s*. per dozen if selected by the purchaser, viz.:—Marnock's Princess Sophia, Sidmouthii, Pulien's Adonis, Pondii, Stormonth, Le Chinois, Audot, Queen, Magnet, Pawley's Prince of Wales, Kentish Bride, Duke of Wellington, Bridegroom, Transparens (Oudin's), Akbbar Khan, Sanguinea, Cylindrica superba, London Rival, Edwardsii, Victorine, Queen Adelaide (Holmes's). A splendid collection of older kinds at 12*s*. per dozen.

Also the following select plants, viz.:—Achimenes picta, 10*s*. 6*d*.; Habrothamnus fasciculatus, 3*s*. 6*d*.; Gloxinia rosea alba, 5*s*.; Thunbergia chrysops, 10*s*. 6*d*.; Brugmansia Knightii (new double white), 5*s*.; Brugmansia floribunda, 5*s*.; Statice pseudo armeria, 3*s* 6*d*.; Mimulus Moodieana (fine), 2*s*. 6*d*.; Mimulus Coleii the finest scarlet yet out, 3*s* 6*d*.; Hydrangea japonica, 2*s*. 6*d*.; Ribes albidum, 3*s*. 6*d*.; Veronica speciosa, 5*s*. A remittance or respectable reference accompanied with the order is respectfully requested.

Tunbridge Wells Nursery.

AURICULA SEED from Stage Flowers, to be had in Packets at 2*s*. 6*d*., of W. J. Nevins, Seedsman, 46, Cheapside, London.

FOR SALE.

NEW TURNIP SEED.—White Rounds at 21*s*. per bushel, for ready money; also Yellow Scotch Turnip Seed at same price and terms.—Apply to Wm. Hunt, Battle, Sussex.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND-MACHINE, for depositing all kinds of Seed on the various Soils, with the greatest accuracy and despatch.—This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of Seed intended to be planted, into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kind of Garden Seeds. 1*l*. 10*s*. each. Commission allowed to Agents.

These Dibbles may be obtained of Messrs. Cottam and Hallam, 2, Winsley-st., Oxford-st., London, through the agency of the principal Agricultural Implement Sellers in the United Kingdom; or from the Inventor, by letter, to his address, inclosing a Post-office order for the amount.—Richard Smith, Upper Hall, near Droitwich, Worcestershire.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes &c.
Garden Edging	

Edward Beck will be happy to answer any inquiries, either personally or by post.

To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*; to the owner of the second-best do., 5*l.*

Long Woolled Sheep. (Not qualified to compete as Leicesters.)—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second-best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*; to the owner of the second-best do. do., 5*l.*

Sheep best adapted to a Mountain District.—CLASS 1. To the owner of the best Ram of any age, 15*l.*; to the owner of the second-best do., 10*l.*; to the owner of the third-best do., 5*l.*—2. To the owner of the best pen of Ewes of any age, 10*l.*; to the owner of the second-best do., 5*l.*

PIGS.

CLASS 1. To the owner of the best Boar of a large breed, 10*l.*; to the owner of the second-best do. do., 5*l.*—2. To the owner of the best Boar of a small breed, 10*l.*; to the owner of the second-best do. do., 5*l.*—3. To the owner of the best breeding Sow, of a large breed, 10*l.*—4. To the owner of the best breeding Sow, of a small breed, 10*l.*—5. To the owner of the best pen of three breeding Sow-pigs, of the same litter, above four and under ten months old, 10*l.*

AGRICULTURAL IMPLEMENTS.

A sum not exceeding 300*l.*

Cheese.—To the exhibitor of the best cwt. of Cheese (of any kind) made within the district, 10*l.* To the exhibitor of the second-best do., 5*l.*

Extra Stock, Roots, and Seeds.—For Extra Stock, of any kind, not shown for any of the above Prizes, and for Roots, Seeds, &c., Prizes may be awarded and apportioned, by the Committee and Judges, to an amount not exceeding in the whole 50*l.*

Any New Implement.—For the invention of any new Agricultural Implement, such sum as the Council may think proper to award.

Seed Wheat, Barley, and Oats.—I. Fifteen Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of white Wheat, of the harvest of 1844, and grown by himself.

II. Fifteen Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of red Wheat, of the harvest of 1844, and grown by himself.

III. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of spring Wheat, of the harvest of 1844, and grown by himself.

IV. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of Barley for malting, of the harvest of 1844, and grown by himself.

V. Ten Sovereigns, or a Piece of Plate of that value, will be given to the exhibitor at the Meeting at Shrewsbury of the best 14 bushels of Oats, of the harvest of 1844, and grown by himself.

Competitors are requested to send with their Wheat, Barley, or Oats, specimens, fairly taken, of the same in the ear, with the whole of the Straw, in a sheaf not less than one foot in diameter, and with the roots attached.

[12 bushels of the Wheat, Barley, or Oats, will be sealed up by the Director or Stewards, and one of the remaining bushels of each variety will be exhibited as a sample to the public; the other being kept for comparison with the produce of the next year. At the General Meeting in December, 1846, the Prizes will be awarded.]

The two best samples of each of these classes of Wheat, Barley, or Oats, without at that time distinguishing, in any of the cases, between the comparative merits of either sample, will be selected by the Judges appointed for the Meeting at Shrewsbury; and will be sown, under the direction of the Council (the winter Wheats in the autumn of 1845, and the spring Wheat not earlier than the 1st of March, 1846), by four farmers, who will make their report, upon which the Prizes will be awarded, provided there be sufficient merit in any of the samples. 10*l.* will be given at the Meeting at Shrewsbury to each exhibitor whose Wheat has been selected for trial, and 6*l.* for the Barley or Oats.

*** No variety which has been selected for trial at any previous Show shall be qualified to compete in the same class.

ESSAYS AND REPORTS ON VARIOUS SUBJECTS.

Prizes for 1845.—PRIZE ESSAYS.

1. *Farming of Nottinghamshire.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Nottingham. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Nottinghamshire since the Report of Mr. Robert Lowe in the year 1798; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

2. *Farming of Cornwall.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Cornwall. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Cornwall since the Report of Mr. G. B. Worgan, in the year 1811; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

3. *Farming of Kent.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the Farming of the County of Kent. Competitors will be expected to describe the different varieties of soil which prevail in the county, the ordinary modes of farming and courses of cropping adopted accordingly in its various districts, and to state how far any peculiar practices in its husbandry are or are not justified by peculiarities of soil or climate. They will also be expected to state what improvements have been made in the farming of Kent since the Report of Mr. John Boys, in 1805; and especially to point out what farther improvements ought to be effected, either by better farming on land already cultivated, or by taking new land into cultivation.

4. *Heath Land.*—Twenty sovereigns, or a piece of plate of that value, will be given for an account of the best method of reclaiming heath-land. Competitors will be required to describe methods which have been successfully adopted in the reclaiming of heath-land, reference being had especially to the following points:—1. The mode of breaking up, whether by paring and burning, or by simple ploughing. 2. The application of lime. 3. The course of cropping. 4. The conversion of heath-land into pasture, where either the steepness of the land, or its elevation above the sea, does not allow the culture of corn.

5. *One-Horse Carts.*—Ten Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on the advantages of One-horse Carts. Competitors will be required to point out the saving in horse-labour, and other advantages which undoubtedly arise from substituting 1-horse carts for waggons.

6. *Catch-Meadows.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on Catch-Meadows. Competitors will be required to describe the best and cheapest method of forming water-meadows on the sides of natural slopes, as practised in Somersetshire and Devonshire; the mode of managing them, and of applying their produce; the increase of value thereby given to unproductive hill-sides; and to state how far this mode of improvement might be applied to the mountainous districts of Wales and the North of England.

7. *Fences.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on Fences. Competitors will be required to describe the best and neatest methods of maintaining hedges, whether for arable or for grazing ground; and to point out how far the present fences in various parts of England are injurious to the farmer, whether by their size, their excess in number, or the over-abundance of timber which they contain.

8. *Fattening Cattle.*—Ten Sovereigns, or a Piece of Plate of that value, will be given for an account of the best method of fattening cattle; as to the places in which they are kept, large or small yards or stalls; as well as the food, roots, hay, &c. on which they are fed during the time of fatting.

9. *Tile yards.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the cheapest and best method of establishing a Tile-yard. Competitors will be required to attend to the following points:—1. Mode of working the clay, according to its quality. 2. Machine for making the tiles. 3. Sheds for drying the tiles. 4. Construction of the kiln. 5. Cost of forming the establishment. 6. Cost of the tiles when ready for sale.

10. *Curing Butter.*—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best description of the Dutch method of salting butter; pointing out the causes of its superiority to other salted butters.

11. *Experiment in Agriculture.*—Twenty Sovereigns, or a Piece of Plate of that value, will be given for an account of the best Experiment in Agriculture.

These Essays must be sent to the Secretary, at 12, Hanover-square, London, on or before March 1st, 1845.

Rules of Competition for Prize Essays.—1. All information contained in Prize Essays shall be founded on experience or observation, and not on simple reference to books, or other sources. 2. Drawings, specimens, or models drawn or constructed to a stated scale, shall accompany writings requiring them. 3. All competitors shall inclose their names and addresses in a cover, on which only their motto, and the subject of their Essay, and the number of that subject in the Prize list of the Society, shall be written. 4. The President or Chairman of the Council for the time being, shall open the cover on which the motto designating the Essay to which the Prize has been awarded is written, and shall declare the name of the author. 5. The Chairman of the Journal Committee shall alone be empowered to open the motto paper of such Essays, not obtaining the Prize, as he may think likely to be useful for the Society's objects, with a view of consulting the writer confidentially as to his willingness to place such paper at the disposal of the Journal Committee. 6. The copyright of all Essays gaining prizes, shall belong to the Society, who shall accordingly have the power to publish the whole or any part of such Essays; and the other Essays will be returned on the application of the writers; but the Society do not make themselves responsible for their loss. 7. The Society are not bound to award a prize unless they consider one of the Essays deserving of it. 8. In all reports of experiments the expenses shall be accurately detailed. 9. The imperial weights and measures only are those by which calculations are to be made. 10. No prize shall be given for any Essay which has been already in print. 11. Prizes may be taken in money or plate, at the option of the successful candidate. 12. All Essays must be addressed to the Secretary, at the house of the Society.

(By Order of the Council) JAMES HUDSON, Secretary.

REFINED PLEASURE to LOVERS of BOTANY.—The Nobility and Gentry are respectfully informed that the splendid WARDIAN PLANT CASES, which excited so much attention and obtained a Medal at the late Chiswick Fete, are now on view at No. 33, Argyll-street, Regent-street.

The suggestions of PROFESSOR LINDLEY have been earnestly carried out by the manufacturer, Mr. POTTS, so as to elicit the entire approval of that eminent authority. The varied charms of Nature are aided by the gorgeous enrichments of Art; and the Invalid, however exalted her station, may now enjoy, at all seasons, the beauties of Flora, in a cabinet not unworthy a place in the most aristocratic mansions.—Apply to Mr. NOTTINGHAM, as above.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority, or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & C. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Pallisading, Field, and Garden Fences, Wire Work, &c. &c.

TO NOBLEMEN, GENTLEMEN, SEEDSMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from T. and C. LOCKHART, of the late Firm of T. and C. Lockhart and Duncan, in consequence of a dissolution of Partnership, to submit to public competition, by auction, on the premises at Parson's-green lane, Fulham, and at 156, Cheapside, London, about or before the 11th September next, the whole of the late partnership's Stock and Fixtures, of which further notice will be given.—This valuable Stock consists of a unique collection of BULBS and FLOWER-ROOTS of every description, which has been carefully selected, both at home and abroad, during the last 25 years, together with a quantity of the newest and most choice Flower Seeds, well worthy the attention of the trade; a newly-erected Hothouse with boiler and hot-water pipes, a capital brick-built pit, boxes, frames, handlights, six nests of seed-drawers, two desks, two bulb stages, hardy herbaceous and other plants, standard roses, a quantity of box edging, bushel and other measures, a Chubb's patent iron safe, scales, weights, bags, paper, garden-utensils, cutlery, sieves, pots, sundries, &c. &c. &c.

May be viewed one week prior to the Sale, and Catalogues had.

TO FLORICULTURISTS.

SUPERB COLLECTION OF MELOCACTI EUPHORBEA, &c

22, Park Place, Liverpool Road, Islington.

MR. E. E. STONE takes this opportunity to express his regret for the error that occurred in this Journal of last week in naming the day of Sale, it having caused so much trouble to Purchasers, and begs to state that he will SELL BY AUCTION, on the Premises as above, on WEDNESDAY, Aug. 27, at 12 o'clock, the splendid Collection of STOVE AND GREENHOUSE PLANTS, by order of a Gentleman removing; also a capital Tulip Stage, the surplus Household Furniture, a fine-toned 6½-octave Piccolo by Peachey, and Effects. May be viewed the day prior and morning of sale, and Catalogues had on the premises and the Auctioneer's Office, 83, St. John-street, near Smithfield.

TO BE DISPOSED OF.—An Extensive and Old-Established COUNTRY NURSERY, where a considerable Business has been carried on for many years. Any respectable person with a knowledge of the business would find this concern worthy of immediate attention. Apply to Mr. GEORGE GRAY, No. 23, New Corn Exchange, Mark-lane, London.

N.B.—None but principals will be treated with.

SOUTHAMPTON.—SMALL CONSERVATORY FOR SALE.

TO BE SOLD, A MOST COMPLETE AND MODERN GREENHOUSE, with span Roof and bow Front, 18 feet by 12 feet, with two Stages, Furnaces, &c., and with or without a choice Collection of Plants. The whole the property of a Lady who is removing.

For further particulars, apply to WITHERS and ROBERTS, Auctioneers, 10, Above Bar, Southampton.

TO BE LET, on Lease of 10, 15, or 20 years, from Michaelmas next, the RECTORY FARM, LITTLE GRANSDEN, containing 400 acres, of which about 250 acres are old and 150 new land; all under-drained.—Apply to the Rev. F. NORRIS, Gransden Rectory, near Caxton.

LENHAM DOG AND BEAR INN AND FARM.

TO BE LET, and entered upon immediately, That Old Established free licensed Road Side Inn and Posting-house, known as the Dog and Bear, at Lenham. Attached to the premises are convenient stabling, outbuildings, and oast-house, and adjoining, are 29 A. 1 R. 15 P., or thereabouts, of excellent arable, meadow, and hop land.—To view, apply on the premises, and for particulars and proposals to let, apply to W. LECHMERE, Esq., 22, Southampton-st., Bloomsbury-sq., London.

TO THE LOVERS OF PANSIES.

S. WIDNALL, Grantchester Nursery, Cambridge, begs to inform his friends and the public that he has with great care selected his Superior PANSY-SEED, warranted to be all new of the present year, and which he can with confidence recommend. This being a favourable season for sowing, it will be advantageous to those who wish to ornament their gardens with this beautiful flower at a very cheap rate, as packets containing sufficient seed, with careful cultivation, to grow 500 plants and upwards may be had postage free at 2s. 6d. per pckt., or three packets for 6s., upon receiving a post-office order.

The Gardeners' Chronicle.

SATURDAY, AUGUST 17, 1844.

MEETING FOR THE FOLLOWING WEEK.

SATURDAY, Aug. 24 Royal Botanic . . . . 4 P.M.

IT is long since we adverted to the DISINFECTION of MANURE, that most important operation, which alone will ever induce people in this country to employ habitually the fertilising materials at their command, or prevent their throwing away money in the pursuit of substitutes uncertain, dear, and comparatively inefficient. It is indispensable to find very cheap methods of destroying the offensiveness of decaying matter, or no stop will ever be put to the enormous indirect waste of national wealth which is now going on.

Among the substances which have from time to time been proposed for effecting this end, some have been dear, like chloride of lime, charcoal, &c.; others dangerous to use, and insufficient, like sulphuric acid; some slow in their action, like gypsum; others too bulky, like peat earth; and others troublesome to employ, as is the case with muriate of lime. Each of these reasons has proved a bar to the employment of such disinfecting agents. But among those which have been occasionally mentioned is one that seems more free than any others from practical objections, and that is sulphate of iron, or what is called in the shops copperas, or green vitriol.

In the year 1842, a Mr. Schattenmann published an account of his manner of employing this substance; and we mentioned his method at p. 191 of our volume for that year. As he is a practical man, and his employment of the salt was on a large scale as a farmer, his observations were entitled to the greater attention. Nevertheless, we do not find that his advice has been much followed; and therefore we beg to invite attention to the following additional evidence produced by Mr. Schattenmann in favour of the use of sulphate of iron:—

"The offensive exhalations produced by putrefying matters arise," says this excellent observer, "principally from the flying off of carbonate of ammonia and sulphuretted hydrogen gas: but if a solution of sulphate of iron is thrown among such matters, a double decomposition immediately takes place; the sulphuric acid of the sulphate of iron combines with the ammonia, and converts it into a fixed salt; the iron combines with the sulphur, and forms a sulphuret of iron. The unpleasant smell of ammoniacal vapour and of sulphuretted hydrogen disappears immediately, and the putrefying matter that is acted on retains nothing more than a feeble odour, which is not in the slightest degree disagreeable."

Now any one may easily verify this fact by taking smelling salts, dissolving them in water, and throwing in some green vitriol; when the fluid will become black in consequence of the separation of the black oxide of iron from the sulphuric acid, and the pungent smell will go off in consequence of the combination of the sulphuric acid and ammonia. In like manner if some green vitriol be dissolved in water, and a stream of sulphuretted hydrogen gas be sent through it, the fluid will become black with great rapidity, in consequence of the formation of sulphuret of iron by the decomposition of the gas; and the disgusting smell will cease to be perceived.

No doubt, then, of the accuracy of Mr. Schattenmann's statement can be entertained, and thus a very cheap and rapid means of destroying foul smells is at once obtained; not indeed so quickly as by the use of chloride of lime, but at infinitely less expense, and quite fast enough for any useful purpose. By this means the most offensive matters may be purified, and putrid substances of the worst description removed without even so much annoyance as arises from common stable manure.

Common sulphate of iron is worth, at the outside, 4*l.* 4*s.* per ton; is not liable to injury by keeping, occupies very little space, and dissolves very readily in water, in which state it is necessary to apply it.

No fear need be entertained of the sulphate of iron, because of its iron, injuring the quality of the manure; experience shows what theory indicates, that it produces no such effect, but that it secures all the advantage anticipated from it, without a single drawback.

We are tempted to introduce this subject into the Horticultural part of our Paper, because in fact, much as it interests everybody, it concerns more especially gardeners, who are either obliged to buy their manure, or, if it is furnished from a farm, are involved in incessant disputes with the farming bailiff on account of it. We advise them to think well upon this article, to disinfect all those offensive matters which are now wasted, and to show the farming bailiff that with hot-water on one side, and sulphate of iron on the other, they can snap their fingers at the farm and all the assistance that is so grudgingly bestowed by it.

"I THINK it a very fit thing," says worthy Master Gerarde, "to adde in this place a rare observation of the TRANSMUTATION of one species into another in plants; which, though it have beene observed in ancient times, as by Theophrastus, 'De Caus. Plant.,' lib. 3. c. 16, whereas among others hee mentioned the change of Spelt into Oates, and by Virgil in these wordes—

'Grandia sæpe quibus mandavimus Hordea sulcis,
Infelix Lolium, et steriles dominantur Avenæ;'

"That is—

"In furrows where good Barley we did sowe
Nothing but Darnell and poor Oates doo growe;

"Yet none that I have read have observed that two severall graines, perfect in each respect, did grow at any time in one eare; the which I saw this yeare (1632) in an eare of White Wheat, which was found by my very good friend Mr. John Goodyer, a man second to none in his industrie and searching of plants, nor in his judgement or knowledge of them. This eare of Wheat was as large and faire as most are, and about the middle thereof grew three or four perfect Oates in all respects; which being hard to be found, I hold very worthy of setting downe, for some reasons not to be insisted on in this place."

What the good Gerarde's "reasons not to be insisted on" may have been, we are unable to discover. Perhaps he was afraid of being laughed at as a dreamer; or, may be, he dreaded an indictment for heresy. Then, it is to be imagined, as now, the doctrine of the transmutation of grain was laughed to scorn; and we have numbered ourselves among the scorners.

But are the scorners right? Are we so *very* sure that one kind of grain has not been formed accidentally from another—that no room is left for argument or evidence? Some years ago we should have said yes; we now say no. We now say that we are not so *very* sure about the matter, although we do still hold hard to the orthodox faith in the matter of species. What has unsettled our belief, and changed us from sceptics into doubters, is the extraordinary, but certain fact, that in Orchidaceous plants forms just as different as Wheat, Barley, Rye, and Oats, have been proved, by the most rigorous evidence, to be accidental variations of one common form, brought about no one knows how, but before our eyes, and rendered permanent by equally mysterious agency. Then, says Reason, if these inconceivable changes have been proved to occur among Orchidaceous plants, why should they not also occur among Corn plants? for it is not likely that such vagaries will be confined to one little group in the Vegetable Kingdom; it is far more rational to believe them to be a part of the general system of the creation.

And then arises the puzzling question of—Where do the Corn plants come from—what country gave them birth—where are they still to be met with in their savage haunts? History says nowhere. The origin of Wheat is wholly unknown; so is that of Oats. Rye is said to occur wild in some of the Caucasian provinces, but that is doubtful; and the Barley which was found by Col. Chesney in Mesopotamia may have been the remains of cultivation. How then can we be *sure* that Wheat, Rye, Oats, and Barley, are not all accidental offsets from some unsuspected species?

A gentleman who lately travelled in Germany was assured, that if Oats are sown early, not allowed to produce ears for the first year, but compelled by artificial means to defer their earing till the second, they will change to other sorts of Corn. A seemingly more monstrous proposition never emanated from the father of paradox. Nevertheless, there could be no harm in putting the statement to the proof. The Marquess of Bristol has done so. At his lordship's request the Rev. Lord Arthur Hervey, in the year 1843, sowed a handful of Oats, treated them in the manner recommended, by continually stopping the flowering stems, and the produce in 1844 has been for the most part ears of a very slender Barley, having much the appearance of Rye, with a little Wheat, and some Oats; samples of which are, by favour of Lord Bristol, now before us. What is to be inferred from this?

But, it will be said, Has the question been fairly tried? The mode was this:—A handful of Oats was taken out of a manger, sown in a garden, diligently cared for, and finally reaped. As Oats do not usually consist of a mixture of Barley, Wheat, and Oats, it could not be suspected that any error would so arise, more especially since the Barley that has been raised is not exactly Barley, for it is longer and thinner—nor Rye, for it wants the structure of that sort of Corn. Nevertheless, there is the possibility of error; and therefore the experiment will be repeated with every precaution, and we hope to be allowed to report the result.

In the meanwhile it would be as well if a good many persons would try the experiment in different parts of the country. The question is, Whether by any means Wheat, Oats, Barley, and Rye, can be made to change into each other? The Germans say that it will happen if Oats are sown early, and prevented flowering till the second year. Gerard says that he saw it happen to some extent, though he did not know how. Is this true or not? The cause will come on for hearing at Michaelmas, 1846. Let the country be the jury; and then, "Gentlemen, what say you?" will be our inquiry.

NOTES ON THE CONIFERÆ OF JAPAN.

Abies Jessensis, Sieb. Tab. 110, p. 19.—This belongs to the Spruce division, and resembles A. Menziesii in its glaucous leaves, and most probably is identical with A. orientalis, a kind considered by some old writers as only a variety of A. alba (the White Spruce of America), but which I imagine, although very much resembling that species in foliage, but not in fruit, is entitled to rank as a species, as it always comes true from seed. It also attains a much greater height, but is never so robust in the trunk as either that kind or the common Spruce. I may here state that the true Abies orientalis of Tournefort is a Spruce and not a Silver Fir, as is stated by a writer (from Nikita) in the *Gardener's Chronicle*, p. 206, 1842, and where the same writer expresses his surprise how I could have stated in the "Gardener's Magazine" for 1840, that it very much resembled the White American Spruce, an opinion entertained by Loiseleur Deslongchamps, who examined the original specimens belonging to Tournefort, and who accordingly published it as a variety of Abies alba; an opinion also entertained by the late Mr. Lambert. I am quite at a loss to know how the writer from Nikita could have made such a statement—he certainly could never have seen either living plants or dried specimens of the true kind, or even consulted any books on the subject; possibly the mistake arose from the writer entertaining the same views as some continental authors, who have atempted to reverse the divisions or subgenera of Abies and Picea.

Abies polita, Sieb. Tab. 111, p. 20.—This is the Abies Khutrow of Dr. Royle, the Abies morinda of Dr. Wallich, and the Picea obovata of Dr. Ledebour. It belongs to the true Abies or Spruce section, and very much resembles the common Norway Spruce, but differs in the leaves being larger, and the cones shorter and rounder. It attains a great height, and is now very common in collections, under some one of the above names.

Pinus densiflora, Sieb. Tab. 112, p. 22.—This belongs to the true Pine section, and has only two leaves in a sheath. In foliage it seems not to differ from that of the Stone Pine (P. pinea), from which most probably it is not specifically distinct; for although in the plate a figure is given of a full-sized cone, which is very small and conical, and very much resembles that of Pinus Massoniana, it certainly must be a mistake, as on the opposite side of the plate the figure of a young cone is given, which represents the true, round shape of that of the Stone Pine. In Japan this kind is stated to attain a height of 40 feet with a clear stem. In Italy the Stone Pine attains a height of from 40 to 50 feet, with the stem clear of branches 20 or 30 feet, and the top forming a kind of parasol. The Stone Pine (P. pinea) is frequently raised from seeds received either from Japan or China, but differs in no way from that of Europe. It has also been raised from seed collected in Arctic America.

Pinus Massoniana, Sieb. Tab. 113 and 114, p. 24.—This kind is not to be distinguished from Pinus pinaster, except in the cones, which are not more than one-fourth the size of those of the cluster Pine. The leaves are in pairs, very robust, and the buds are non-resinous and imbricated. It has been frequently raised from Chinese seed, but not the least distinction can be seen between the young plants and those of the common Pinus pinaster either in habit or foliage. The late Mr. Lambert, in his "Monograph on Pines," considered it as identical with the P. pinaster; and Mr. Loudon, in his "Arboretum Britannicum," adopted the same views upon the authority of Professor Don, who evidently had never seen cones of the true Pinus Massoniana. The Chinese Pine of Mr. Lambert (Pinus sinensis) is a very different kind from P. Massoniana, and has been erroneously published in the "Pinetum Woburnensis," as P. nepalensis; the P. nepalensis of Dr. Royle being the same as P. Massoniana of Siebold.

Pinus parvifolia, Sieb. Tab. 115, p. 27.—This is the Siberian variety of Pinus cembra, seldom makes shoots more than a few inches long in the course of the year, and probably will never grow more than 10 or 12 feet high in England, even under the most favourable circumstances, while the Helvetic, or Swiss variety, which is the most common in collections, attains a height of from 30 to 40 feet. The leaves are in fives, and the cones are smaller and longer than those of the Swiss kind.—*George Gordon.*

ENTOMOLOGY.

THE APPLE-BLOSSOM WEEVIL, called *Anthonomus pomorum*.—Last April I received some Apple-buds; the petals had formed globes, but had assumed a rusty

colour; on opening one some time after, I found the stamina and germen entirely consumed, the withered petals forming a hollow globe (fig. 1), within which was lying a brown pupa: about the middle of June three of the Apple-weevils hatched, and on examining the buds, I found a hole on one side from whence the beetles had escaped from their tombs (fig. 2). In some seasons the larvæ are feeding the beginning of May, and the beetles have hatched by the 25th.*

These little animals sometimes occasion great loss to the Apple-grower, especially in cider countries in backward seasons, when vegetation is retarded by cold and wet, which afford the beetles a much longer period to perform their operations; and such was the case in 1816, 1831, 1832, and 1838. Like many other insects in their perfect state, they live through the winter, secreting themselves in the chinks and under the loose bark of trees, beneath stones, clods of earth, &c. In March, when the flower-buds are swelling, the beetles emerge from their retreats, when the males are seen in sunny mornings flying amongst the trees in search of the females, who generally are crawling over the branches, although they are also furnished with wings. They seem to be very careful in selecting proper objects for the reception of their eggs, and on finding a suitable bud, the female bores a hole with her minute jaws, which are placed at the tip of the slender proboscis, until she has reached the parts of fructification, and turning round, she lays an egg in the hole by inserting her ovipositor, and then closes it again with her mouth, and seems as if she were forcing in the egg; this is rather a tedious operation, and is said to occupy three-quarters of an hour; she then hastens to another swelling flower-bud for the same purpose, and is thus employed two or three weeks, viz. until the flowers begin to expand, when her labours cease; for, as the larvæ can neither bear wet nor sunshine, they require the protection afforded by the closed petals. The eggs are hatching from the beginning to the end of April, principally influenced by the variations of the season; if the weather be warm, they are matured in five or six days. During this period the bud grows, and the petals appear of their usual rosy colour, but instead of expanding, they wither, and eventually turn to a rusty brown; and on opening them, in place of the germen and stamina, which have been consumed by a single maggot, one finds rolling about in this globular chamber a pupa, of a deep ferruginous colour, which is very sensitive and restless when touched (fig. 4). The maggots are curved, fleshy, and whitish, having numerous segments and wrinkles, with a few short hairs, but no legs; the head is horny and black, and furnished with small jaws (fig. 3). The exact time they remain in the pupa state has not been ascertained, but in about a month from the period when the eggs are deposited the Weevils hatch, and eating a hole through the dry petals, they disperse over the tree, and feed upon the leaves during the remainder of the summer. Like most of the Curculionidæ when approached, the Apple-weevils contract their legs and fall down, so that it is difficult to detect and capture them in any numbers, except whilst they are pairing, or when the females are engaged in depositing their eggs.

The Apple-blossom Weevil was named by Linneus Curculio pomorum, and it has been distinguished by later naturalists as the Anthonomus pomorum (fig. 5). It is long and pear-shaped, of a reddish-brown colour, punctured, and clothed with short, depressed, whitish and ochreous hairs; the rostrum is long, subcylindrical, curved, and sculptured; towards the apex are placed the antennæ, which are slender and geniculated; the basal joint is very long, slender, and clavate—the second is oblong, the six following are more or less globose, and the remaining four form an oval-conical club; the head is subglobose, with two very prominent little black eyes; the thorax is semi-ovate, truncated before with three indistinct stripes of a paler colour; the scutel forms a white dot; the elytra are elongate-ovate, with nine punctured striæ on each; beyond the middle is a large piceous lunar patch, bearing a pale oblique stripe across the centre, forming an angle at the suture, and towards the apex are two ochreous spots; wings very ample; legs moderately long and ferruginous; anterior thighs stout, with a strong tooth beneath—the others are similar, but smaller; the anterior tibiæ are sinuated internally, and they are all terminated by a claw; the tarsi are 4-jointed, the third joint being bilobed, the fourth furnished with minute claws. The smaller figures denote the natural sizes of the animals.

These beetles will also lay their eggs in the flower-buds of Pear-trees, and it is on calm days the females are occupied in depositing them; for in windy or frosty weather they retire to sheltered situations. In genial springs, when the blossoms open in a week or ten days, these Weevils do little mischief; but in cold, damp seasons, when the buds are three weeks or more in expanding, scarcely an Apple-blossom sometimes escapes. The best mode of destroying them is to gather the punctured withering flower-buds and burn them, by which means the larvæ and pupæ will be cut off, and the beetles may be collected by beating the branches over a net; but unless this be done as soon as they make their appearance, it will not be of much service, as the eggs will have been deposited. From various statements it seems that the females will not readily fly, and, as they crawl up the trees, their incursions may be stopped, and the crops saved, by winding tarred bandages round the upper portion of the trunks.—*Ruricola.*

* See Curtis's Brit. Ent., fol. and pl. 562, where directions and descriptions of the genus and species will be found.

ON THE HYSSOP OF SCRIPTURE.

At the meeting of the Royal Asiatic Society, on the 15th of June, a paper was read by Professor Royle, on the plant which he thought was the Hyssop of Scripture. Having so recently read a paper on a kindred subject, the author referred to it for the principles which should guide, and for what should be considered as proofs in such investigations; and stated that in this, as in the case of the Mustard-tree, he had been led to the discovery from the similarity of the Hebrew name to one occurring in the lists of drugs in the writings of the Arabic writers on Materia Medica. Dr. Royle then proceeded first to enumerate the passages of Scripture in which Hyssop is mentioned: first, in Exodus, ch. xii. v. 22, where the Israelites are directed to take a bunch of Hyssop, dip it in blood, and sprinkle the lintels and posts of their doors; second, in Leviticus, ch. xiv. v. 4, 6, and 52; and Numbers, ch. xix. v. 5, where Hyssop is directed to be used in the ceremonies of cleansing the leper, and for sprinkling the water of separation. To this ceremony reference is made in Hebrews, ch. ix. v. 19; thirdly, Psalm xli. v. 2, "Purge me with Hyssop, and I shall be clean;" fourthly, 1 Kings, ch. iv. v. 23, "And he (Solomon) spoke of trees from the Cedar that is in Lebanon, even unto the Hyssop that springeth out of the wall;" fifthly, The last mention is in the crucifixion of our Saviour, John, ch. xix. v. 29, "And they filled a sponge with vinegar, and put it upon Hyssop, and put it to his mouth." Matthew and Mark in mentioning the same circumstance, state that the Hyssop was affixed to a reed, or small stick. From these passages the author inferred that any plant answering to what was required, should be found in Lower Egypt, in the Desert of Sinai, in and near Jerusalem, grow naturally on rocks or walls, and be large enough to yield a stick, and be supposed to have cleansing properties, and have a name in the Arabic or vernacular languages similar to the Hebrew name. Numerous plants have been brought forward as the Hyssop of Scripture, but none of them possess all the above requisites. Some authors have adduced Mosses and Ferns, others the bitter Artemisias; but the greater number have considered some sweet herb of the family of Labiate plants, to be the Hyssop of Scripture. The Artemisias are probably the only plants which are found in all the above localities, but they do not grow upon walls; and of the Labiate plants, the Rosemary is the only one large enough to yield a stick, and we do not know any species which grows upon walls, and is found in all the required localities. In attempting, however, to identify the Hyssop of Scripture, it is necessary, the author observed, to know the names by which it is designated in Hebrew writings; in these it is written both *Esob*, and *Esobh*, and *Esof*; and in the Chaldee version, *Esofa*. Dr. Royle then stated that his attention had been drawn to the subject from observing in Rhases that there were two kinds of Hyssop, one of them growing on the mountain of the Temple, that is, Jerusalem; and this, in connection with Burckhardt describing a plant called *Aszef*, which he found in several wadies about Mount Sinai, creeping up the mountain side like a parasitic plant, its branches covered with small thorns. From the name and description, Dr. Royle inferred that this must be the Caper plant; and on investigation found that *Asuf* is one of the well-known names of this plant, as may be seen in the "Camus," also in Richardson's "Arabic Dictionary," and in the "Ulfaz-Udwieh," &c. The similarity in name being sufficiently great, the author proceeded to show that the plant corresponded in a number of the necessary requisites. Thus the Caper plant is well known to be indigenous in Lower Egypt; Bové found it near Mount Sinai, also on the ruins in the neighbourhood of Jerusalem, as has been done by others. That the habit of the Caper plant is to grow on rocks and walls, is too well-known to require to be proved. Hence we learn this: the *Asuf* has the habit, and is found in all the situations where the *Esof* must have been indigenous for the Israelites to obtain it. That it possessed, or was supposed to possess, cleansing or detergent properties, may be seen in the account of its properties from the time of Hippocrates to the present time. Pliny says it is useful in a skin disease nearly allied to leprosy: in the cleansing ceremonies for which *Esof* was employed by the Israelites. It has long formed one of the "Quinque radices aperientes minores," or the five lesser aperient roots. It holds a place in some of the Continental Pharmacopœias, and is universally esteemed in the East. It remains only to see whether the Caper plant would yield a stick long enough for a man with his outstretched arm to be able to raise the sponge dipped in vinegar to the lips of our Saviour. The cross, to be strong enough, could not have been very lofty, for it to have been borne by our Saviour, and therefore, an ordinary-sized stick would be long enough for the purpose. Such a stick a shrub like the Caper plant, growing in a congenial climate, would be able to yield, as Pliny describes the Capparis as a shrub of a hard and more woody substance. Hence, we have seen that the Caper plant has an Arabic name *Asuf*, similar to the Hebrew *Esof*,—is found in Lower Egypt, in the deserts of Sinai, and near Jerusalem—grows upon rocks and walls—was always supposed to be possessed of cleansing properties, and is large enough to yield a stick. Dr. Royle, therefore, concluded by stating, that as he could not conceive it accidental that all these circumstances are united in this plant, as they must have been in the original *Esof*, he must consider it as proved that the Caper plant is the Hyssop of Scripture.

Home Correspondence.

Watering bedded-out Plants.—I am rather astonished to find such serious complaints about the season for flower-garden purposes. I imagine that it has been much the same in all parts of the kingdom, and the only serious ground of accusation appears to be the drought. As far as my experience goes, however, I much prefer a dry season, if warm, than one in which heavy rains predominate. As, however, in a dry season watering is indispensable, and as in this, like most other processes, there are various modes as well as degrees, it becomes a matter of some importance to inquire which is the best. The importance of bottom-heat is now pretty well understood: it is also admitted that moisture is a heat-carrier. In the face of such facts, then, I cannot conceive how it is that evening watering should be so much persisted in out of doors. A great deal of the weather we experience through the months of May and June in each year, consists of sunny days, with cold nights. Now, one of the most important measures to adopt in this case would be to arrest radiation by some covering; but as this is expensive, it is not to be generally recommended. However, if we cannot shut in the heat, we ought not to take active means to disperse it. There are, it would seem, two distinct objects sought to be obtained by watering in general:—The one called a thorough watering is, of course, intended to facilitate the decomposition of organic, and enriching matters in the soil, and to fill the tissue of the plant with fluids; and the other such as we apply to cuttings, &c., and designed merely to prevent excessive and debilitating perspiration from the leaf. Now, I contend (and from long experience of the matter) that this latter mode of watering is the true and most eligible one for flower-gardens, in which the great majority of mass plants are natives of more genial climes than we can boast in Britain. As a question of bottom-heat, too, it will be admitted that it is only by slowly progressive accumulations that the temperature of the earth advances from the freezing point to 70° or 80° in summer. This accumulation, then, in the case of acclimatising, should not be too rudely dealt with; for I make little doubt that a heavy watering after a bright sunny day, will at any time rob the earth of 5° in the course of a few hours, more especially if the day has been calm; on such days the bottom-heat accumulates with great rapidity. Early morning watering, then, will be found the most eligible by far for flower-garden purposes in general, except perhaps in July and August. Moreover, the watering of newly-planted masses should not be intrusted to men who have only one idea, viz., that of drenching. If the waterer will give the beds as much as will meet the demands of the plant through that day it is enough. Much depends on the way in which plants are transferred from pots into beds; plants taken from the cutting-pit only a few days previous must be expected to undergo a severe stagnation, if transferred to the beds before undergoing a gradual hardening process. This may often be perceived in such plants as the Heliotrope or the scarlet Pelargonium; the leaf of the Heliotrope frequently assumes a dark-purple hue from the sudden change. Cuttings should not be struck in a temperature unnecessarily high for clumping out. Nothing is gained in the end by such hurry. All single plants on elevated beds should, when planted, have a small basin hollowed in the soil round the stem, or the consequence is, the ground becomes battered by the application of so much water, on account of the convexity of surface, and forming ready channels to the side of the beds, escapes without conferring any benefit.—*Robert Errington.*

Flower Gardens.—I can bear testimony to the gay appearance of the Flower-garden at Tandridge Court, and I believe what Mr. Clark states to be true, viz., that he has dispensed with the watering-pot; but he should have mentioned that the Flower-garden at Tandridge Court was formerly a horse-pond abounding with springs, but was filled up about eight years since with good sandy loam; at that time no precaution was taken to drain it, and consequently it became so wet and damp that the turf had to be removed, and gravel-walks with Box-edging substituted in lieu of the turf; it also, at the same time, underwent a thorough draining. Now there is no need for the watering-pot where sufficient moisture exists, as is well known to be the case at Tandridge Court. Since visiting Tandridge I have seen the Flower-garden at Barrow Green, the seat of C. Masters, Esq., and I was agreeably surprised to find it quite a mass of beauty; on inquiry Mr. Sharman, the gardener, told me that every bed had been copiously watered every evening, and that he found it quite requisite, for when water was withheld the plants died outright.—*W. H. M., Godstone, Surrey.*—Another correspondent adds—"A writer in the Calendar lately has justly remarked that "this has been a trying season for gardeners;" for instead of the air parting with its moisture to vegetation, it has been making a continual drain upon the leaves; so much so, as to prevent newly turned out plants from producing either roots or branches. This, I dare say, most gardeners are aware arises from an insufficiency of moisture in the air compared with its power of carrying it. This

is owing to the current of air coming from the north-east, or out of a colder latitude, and passing over a warmer surface as it approached us, which caused it to ascend, becoming expanded. During the time that the north-east wind prevailed, it was no uncommon thing to see, just after sunrise, clouds portending rain, dissipated in a very short time. When the wind shifted to the south-west, we imagined vegetation would be all right, from the circumstance of the current of air coming from a lower latitude, descending and condensing as it reached us; but such was not the case, as the great heat the earth had attained, caused a powerful surface action sufficient to prevent the deposition of moisture; and it was not until contrary currents of air cooled down the atmosphere, that rain fell, and vegetation made any progress. How far we shall profit by the experience of the past season I cannot say; but I consider that "W. P. A." is entitled to our thanks for his judicious remarks. "E. C." speaks of a flower-garden being in beauty about the first week in August; but it is a very different thing to have it in perfection about the latter end of June and beginning of July. This, I apprehend, is what "W. P. A." alludes to; it is what I have been accustomed to see in other years. Had "E.C." mentioned a few of the plants he saw, and also said something about their arrangement, it would have considerably enhanced the value of his statements.—*C.**

Pine-Apples.—In a late Number, "M. S.," replying to an article of mine on the Fruiting of the Pine-Apple, states that I have said, "Queen-Pines showing fruit in August would ripen fruit by the end of October." On referring to my MS., I find it there written "the end of November." I noticed the mistake in the article when it appeared, and I beg to assure "M. S.," if it is was written October in my communication, it was an error of mine, but at the time I imagined that it was a misprint. I may mention that, with houses properly constructed, it is quite practicable to ripen the Queen-Pine between the time of showing fruit in August and the end of November.—*James Roberts.*

Thornfield Pines.—A trip to Thornfield has afforded me the pleasure of spending an hour with Mr. Hamilton, and I can add my testimony to the great excellence of the peculiar plan adopted by him in the fruiting of the Pine, as shown by the beauty and size of his fruit. In my opinion, Mr. H. is anxious to have for his principles of culture, "a fair field and no favour;" and certainly if the practice, in the hands of others, proves equally successful, he may with full assurance look forward to the period of the great object of his wishes being attained. Such instances of persevering industry, and singleness of purpose, merit the favourable consideration of all.—*A. B. C.*

Planting Pines in Tan.—The remarks of "Judex" have induced me to add further testimony with regard to the bad effects resulting from planting out Pines in tan. I am exactly in the same predicament as "Judex." After consulting Mr. Hamilton's Treatise on the Pine, I planted out nearly 100 fine succession plants in new bark, similar to what Mr. H. recommends; to my dismay, however, the plants all showed fruit in a few weeks afterwards, and on examination I found that instead of making roots in the tan, they had nearly lost all they had. The tan was slightly dried before being put into the pit, and it had a nice heat in it when the plants were put out, as well as all the time they remained in it; in fact, I never paid so much attention to anything as I did to this pit of Pines: I watched them morning, noon, and night, and I am sure that the fault does not result from any mismanagement, but is wholly attributable to the tan.—*Hannibal.*——Another correspondent writes as follows:—"I visited Thornfield lately, and I am not surprised that Mr. Hayward should have considered the Pines that are planted out to be a year older than those in pots, for their appearance fully justifies that opinion. With regard to the statement of "Judex" that tan 'is considered to possess no fertilising power,' I imagine the following instance will justify a different opinion. I had a seedling Fig in a 60-sized pot, which I plunged in a bark-bed, and to my surprise, when I came to lift it for re-potting, I found that it had pushed its roots through the bottom of the pot, so far into the bark, that after I had shaken the loose bark off, there remained a mass of roots firmly matted together as large as a No. 12-sized pot. If any doubt this I would advise them to visit Thornfield, where they will find Mr. Hamilton willing to give every explanation of his mode of culture, which I have no doubt will in time entirely overturn the old system of Pine growing."—*G. Rushworth, Dewsbury.*——A third writer remarks:—"I have long been a practical gardener and a Pine-grower, but I have never seen Pines equal to those at Thornfield; they are grown on suckers attached to the old stool, and I have myself seen two fruit cut from the same stool in one year; the second fruit ripened in ten months after the first was cut. A plant of Jamaica, which matured its fruit in December last, is now ripening another fruit, which, in all probability, will be ready for cutting in October. I am quite convinced that if prejudice is laid aside, in a short time Mr. Hamilton's system will be generally practised; and why should it not? Twice the quantity of fruit of superior quality can be produced in the same space. I nowhere read in Mr. Hamilton's Treatise that leaves and tan are recommended; Mr. Hamilton's system does not at all depend on turning out the plants into the tan; some are planted in compost, and some are in tan, but the greater part of them are in pots; those that are in tan, however, have made twice the progress of those in pots; but the fruit that I above allude to are produced by plants growing in soil.—*J. C. Turner, Stockport.*——A fourth communication says—"Judex" (p. 524), who states that he has been acting under the advice given in Mr. Hamilton's Treatise on the Pine Apple, turned out into tan, or rather into tan and decomposed leaves, mixed and laid up in a heap which had been at work six weeks, 24 fruiting plants. He writes that the tan was just to give life to the mass, and adds that such a compost is just what Mr. Hamilton would have selected himself. Now, I would inquire in what page of my treatise he discovered such a compost recommended? Had he communicated to me his intention of differing so widely from what I have recommended in my Treatise (see pp. 58, 73, 60, and 103), I could have informed him what the result would have been, namely, that three parts decomposed leaves to one of tan would act like leaven, souring the whole lump as soon as fermentation commenced; and it appears that it had been put up in a heap for that purpose. It is wrong to charge me with having recommended such a compost. If "Judex" has ever read my Treatise, he must have remarked my caution against the use of impure tan, as well as of other composts. Has "Judex" used the same compost which I have recommended for tanks? If he has not, I shall not be responsible should that also prove a failure. My plants which fruited in last December are now swelling another fruit; a fact that can be proved by persons of the highest respectability, and whose veracity no one will question. Mr. Barnes's excellent remark, p. 31 of this year, is worthy of perusal. He uses sweet pure composts, similar to what I employ myself. "Judex" justifies himself by cautioning the readers of the *Chronicle* against—not the compost which I recommend, but his own bad material, of which he is the inventor. If he will visit Thornfield soon, he shall have ocular proof of the advantages of planting out Pines in tan, both with regard to plants and fruit; and I dare state that the largest fruit he ever saw, according to the size of the plant, is now ripening on my improved mode of planting in tan. The most of my fruiting plants, however, are growing in a mixture chiefly composed of soil similar to that recommended in my Treatise, and such as I will always recommend where the tank system is used. I imagine we are only learning to cultivate the Pine; every succeeding year adds something new to our experience. In conclusion I would state, that any Pine-grower adhering strictly to my system, may with ease perfect one fruit every year from the same plant. I have formerly, and still do, cut three fruit in two years from the same plant.—*Joseph Hamilton.*

Morphology. — Monstrosity of Cerastium. — The curious illustration of Morphology which is sent with this note was found a few days since on the banks of the river Wye, near Tintern, and seems to be of sufficient interest to deserve notice in the *Gardeners' Chronicle*, as illustrating those sound scientific views which have recently appeared in that Journal. The usual structure of this genus is too well known to require description here.

Explanation of the Magnified Figures.

1. An expanded flower. 2. The ovary and stamens. 3. The ovary cut open, showing the ovules. 4. An ovule.

In the present plant it will be seen that the petals and sepals have quite taken upon themselves the appearance and structure of leaves, and that the germen also clearly shows that it is formed of five leaves, attached to each other by their edges. The following is a description of these curious flowers:—Sepals 5, green, hairy, distinct, spreading, oval, differing from the uppermost leaves only by being broader in proportion, and smaller, and having a membranous edge towards the end; petals spreading, and quite similar to, but smaller and rather narrower than the sepals; filaments of the stamens covered with hairs like the leaves; anthers unchanged; germen covered with hairs, green, oblong, with five ribs and furrows, tipped with five minute callous points, and only slightly connected at the top; ovules apparently abortive. In these specimens we see what must be a demonstrative proof to all unprejudiced minds, that the sepals and petals do not originally differ from leaves, but are the same organ adapted to the performance of a different function; and also, that the germen is nothing more than several similar leaves (for, if separated and spread flat, they differ solely in size) placed together in such a manner as to form a pouch, to include the ovules, and assist in their development into seeds. There were numerous specimens possessing this interesting structure. The soundness of the morphological views held by scientific botanists is now so well established by the numerous instances of different organs reverting to their original type, which have been brought to light, as not to require my advocacy in this place; still, it would appear that there are persons who so misrepresent, or perhaps misunderstand the facts, as to suppose and state that those who hold them are not as full and firm believers in the superintendence of a Divine Providence, and know as certainly that everything in Nature is perfectly adapted to perform the functions for which it was created, as they are themselves. To such it can only be said, that the unprejudiced search after truth cannot fail to produce a fervent admiration of the Divine power and wisdom that is displayed in the creation.—*Charles C. Babington, St. John's College, Cambridge.*

The Gray Wagtail.—Some of your readers may be pleased to hear a little more of the gray wagtail, an account of which appeared in your columns on the 21st of last October: they may like to be informed what became of it, and whether I succeeded in discovering the object of its visits to my house. I am still unable to say anything decisive on the last point; I had the window washed as I proposed, but this made no difference, the bird coming as before. Once it was seen to pursue an insect, which it caught, after alighting upon the ledge; but such a solitary instance cannot prove anything. Several windows were occasionally visited, though the first continued the favourite. After a while, we became so much accustomed to the tapping, that it scarcely excited our attention. I have learnt that two other houses in the parish were in the course of the winter visited in the same manner, and at one of them a little alarm was felt by some persons who were disposed to be superstitious: but it seems difficult to account for the appearance of so humble a creature causing alarm to any one. When wrote before (early in the month of October), I stated that I had not observed any more wagtails of the same species about, but others arrived afterwards. Still, I believe it was throughout the same individual that visited us; and I form this opinion from having often seen my feathered acquaintance stop at a particular spot (the shallow water alluded to in my former notice), both when going to and returning from the house; and I never perceived but one in that haunt, though in other places there used to be more of these wagtails together. For the same reason, I conclude that, as our visiter came here the first, so he remained the last of his kind: I noticed one bird for some time after I had lost sight of the others, and that one frequented the haunt aforesaid. Boarula made his adieus to us at the window on the 18th of February, but he lingered in the village another fortnight; I saw him on the 1st of March, soon after which he must have commenced his journey to the north. When he left us he had not changed his dress, but doubtless he long ago put on his best suit. I trust he found a constant mate, and a comfortable home, and if he has a family, that they are all doing well. Should he visit us again in the autumn, he shall have a welcome; and I hope he will then come somewhat less careworn in his looks.—*S. Warnford.*

Coniferous Plants.—Could you turn the attention of some practical botanist to writing a book upon the nature and habits of Coniferæ? A small work like Rivers' "Rose-fancier's Manual" would answer the purpos admirably; and the smallness of its price would bring it within the reach of every one. The information chiefly required is a detailed account of each variety, to what climate and country it naturally belongs, the quality of the timber, and in what description of soil it attains the greatest size. Mr. Selby, in his admirable work on British Forest-trees, speaking of the new varieties of this tribe, begs of gentlemen not to content themselves with merely planting them in pinetums and shrubberies, but to give them a fair trial among other forest-trees. We shall never know which of them are adapted to this country so long as we only plant them in the shrubbery—always the driest and most sheltered spot about the place, and where the gardener carefully shades them from the snow and winter blast. If we wish to find what they are really worth, we must put them out in our plantations, and a very few years will show which of them are likely to be acquisitions, and which are not. Some may thrive very well in a shrubbery, when protected from the snow; but be quite unfit for bearing up against a long continued storm, with their branches bowed down with six or eight inches of snow upon them. Others may do very well when sheltered from the wind, but be brittle and apt to snap over when exposed to sudden gusts. Varieties with both these faults may thrive for years in a pinetum, and yet be worthless as additions to our forest-trees. I was delighted to see in the *Chronicle*, some weeks ago, that an Irish gentleman had taken the matter up in this light, and had made a plantation of 11 acres of Deodar. If other planters would follow his example, we should soon know practically the merits of every new variety. I intend doing the same this next winter, and am now busy fencing and draining the land for a plantation of Scotch Fir and Larch, among which I shall plant as many seedlings as I can get of P. cembra, P. gerardiana, P. excelsa, P. laricio, P. pallasiana, Deodara, Morinda, Araucaria imbricata. The only protection they will have will be a few Osiers round them, to keep off the rabbits and hares. As the ground on which they are to be planted is a high open upland, about 1000 feet above the sea, it will be a sufficiently severe test as to whether they can stand our winters or not.—*Waldeve.*

Bees.—In reply to a "Would-be Lover of Bees," respecting the attack made on him by these insects, I beg to suggest as a preventive, that he should provide himself when near his hives with a veil composed of stiff muslin, fastened tight round the band of his hat, and beneath his chin, and tight round the collar of his coat; this will entirely prevent his being stung on his nasal organ, or any other part of his head. If a "Would-be Lover of Bees" had, immediately on his extracting the sting, gone to his Onion-bed, and applied the interior part of that vegetable to the wound, he would have found instantaneous relief, might have appeared both at church and market, and have had no occasion to complain of the want of an antidote for the unpleasant attack. I have a great quantity of bees under my care, on the Canadian system, which are intolerably vicious; and I have adopted the foregoing plans with complete success. —*Eureka.* [Another correspondent, signing himself "Apis," confirms the above statement. A still better guard, however, is a fencing-mask.]

Bees.—I wish I could afford "A would-be Lover of Bees" the means of rendering himself more agreeable to those insects. Washing the face and hands, and rincing the mouth with ale, prior to approaching them, are generally considered most effectual. As respects the application of volatile alkali, by which I mean what is usually called spirit of hartshorn, I wish it had been stated how long after the wound was inflicted the alkali was applied. The venom of the bee is so quick and so diffusive in its effect, that the utility of the remedy (which I have always succeeded with) depends upon the promptitude with which it is applied.—*Edward Bevan, Esgair Evan, near Newtown, Montgomeryshire.*

Heaping Earth over Roots.—A correspondent having obligingly informed us that he knew of a Mulberry tree over whose roots earth had been heaped without injury to it, a wall being built round the stem, we requested further particulars, in consequence of which we have been favoured with the following:—The Mulberry trees were planted in the autumn of 1810, and then measured between four and five inches in girth; the lowest branches shot forth six feet from the ground. The soil is a rich mould, to which was added at each spot a large cart-load of mortar rubbish well mixed in, and forming a circle of 10 feet diameter; and great care was taken to plant them at exactly the same depth as when taken from the nursery, and to arrange and secure the roots so that they might extend on all sides. In the sixth year they produced a very handsome dish of remarkably fine fruit, and in every succeeding year there has been an increased produce. In the year 1832, when the garden was enlarged, the soil required to be considerably raised; and to prevent the accumulation of fresh earth injuring the roots, a four-inch wall was built round each tree, six feet in diameter and three feet in height; a tiled drain was made from one well to the other, and carried on to take off the surface water, which it does effectually. Many persons predicted the death of the trees from the great weight accumulated over the roots, and the exclusion of the sun's warmth, but they have continued to flourish even more than before, bearing fruit abundantly and making shoots yearly which average about 10 inches. It must be remarked that the wall was built on the original surface, without in any way disturbing the roots. The measurement of the trees at three feet from the ground is at present three feet in circumference. Several of the branches at three feet from the body are 18 to 20 inches in circumference. The top covers a diameter of 20 feet. The earth, which was applied to the roots in 1832 was gradually sloped down, therefore no exact diameter can be given. This is the substance of the account received from my friend. He says the idea was entirely his own, and I must say it does him great credit. I cannot see why it may not answer as well with trees of a larger size and of course greater age.—*M.* [In this case—1, each well was connected with other wells by cross drains; 2, the soil was very loose, in consequence of old mortar having been freely intermixed. Hence air had peculiarly ready access to the roots. It appears moreover, that the earth which was heaped up, *was sloped* away towards the circumference, and our informant does not know to what extent that took place. But this is a most important point; because it is only the roots at the circumference that are much affected by the superincumbent earth; and if it were pared away much they would not be conscious of its presence.]

Glycine sinensis.—Although it is now nearly 30 years since this elegant twining plant was introduced from China, it does not appear to me to be so generally cultivated as it deserves. What this is owing to I cannot pretend to say, as few plants are more easily propagated, or present a finer appearance in early spring, when loaded with its long drooping clusters of Lilac-coloured flowers. The usual mode of increasing it is either by cuttings of the roots, or by layering, in small pots plunged in the earth, the young shoots whilst making their summer growth, and which are found to emit roots at every joint. On looking over some old memoranda lately, I met with the following particulars respecting the striking of the Glycine from cuttings. Perhaps they may be interesting to the readers of the *Chronicle*, and be the means of increasing the culture of my favourite plant. Cuttings taken off at this season strike more freely than when made in the spring. The shoots best adapted for the purpose are those which have become firm and hard, but not too woody. In preparing the cutting, two eyes are all that are necessary to be left on each. Out of two pots containing 100 cuttings prepared in this manner, and inserted in pure silver sand, such as is generally used in the neighbourhood of London for striking with—only 5 died. They were placed in a moderate hotbed on the 20th of August, 1829, and in the course of three weeks were found to have made roots from 3 to 4 inches long, although scarcely any difference was observable in the appearance of the buds, excepting that they had swelled a little more than when put into the pots. Six weeks afterwards they were potted off into small pots, and preserved during winter in a common frame. The following spring the greater number of them sent out shoots, some from the upper eye, and others from the one at the base of the cutting: a few remained dormant until June. From the above it appears there is little difficulty attending the striking of Glycine sinensis, and this circumstance, I hope, will induce many to make the experiment. I readily admit that as a garden plant the Glycine is common, but it is as a twiner for decorating the porches and walls of cottages and lodges that I should wish to see it more extensively employed. Every one who has seen the fine specimen in the Horticultural Society's Garden at Chiswick, when in blossom, must have been struck with its beauty. In 1834 it covered a space of 800 superficial feet. Being against a south wall, the flowers remain a shorter time in perfection than when trained against a wall with a south-east, or eastern exposure. The latter shows it to great advantage, as it is later in coming into blossom, and the colour of the flowers is not so liable to be injured by the sun.—*M. E. H.*

Sports.—I have now in bloom a plant of Menziesia polifolia stricta rubra with red and white spikes upon the same branch; it has flowered so for the third summer.—*F. X. O., Cliff Vale.*

Preservation of Seed.—We have just received some seeds of the Nutmeg-tree (*Myristica moschata*), sent to us by Mr. Lockhart, of Trinidad. They were removed from the pulp and mace, packed in moist Moss, and closed in a tin box almost hermetically. They have germinated during the voyage and thrown out a radicle and a plumule to the length of an inch or more each, and apparently could not have come in a fitter state for planting with a prospect of their success. Surely the seeds of Victoria might thus be sent by some of our South American friends.—*W. J. H., Kew.*

Tropæolum canariense, &c.—The flattering notice in your columns last year (p. 573), respecting the cultivation of this, by Mr. George Davidson, has induced him this year to redouble his exertions; and notwithstanding the drought and prolonged easterly winds he has had to contend with, he has produced about six of the most splendidly-grown specimens of this plant which I have ever beheld, and which are alike creditable both to his zeal and ability. This year he has planted two plants for each mass, and he has thus procured such a dense profusion of foliage, that the whole framework round which the plants are trained is in some instances entirely concealed; and moreover the leaves at the bottom of the stem are so profuse, as thoroughly to prevent all nakedness of appearance near the roots. The plants have been sown in a rich compost of decayed leaf-mould and other matter, and this has not only acted as a powerful stimulant in their growth, but has greatly improved the size, vigour, and freshness of colour of the leaves and flowers, as any of your London readers will perceive if they will visit the western end of the long garden walk, now well deserving the name of a garden —may it ever continue so! The public are not aware of the interest taken in these grounds by those employed in them. Mr. Edwards, the chief superintendent, most liberally supplies (from his own garden), pipings from his beautiful Carnations, and the best seedlings from his Heartsease, while Mr. Baxter, the able superintendent of the greenhouse department, is indefatigable in raising cuttings and seedlings in frames of his own construction; such zeal and activity, such hearty good-will, are surely deserving of all praise. To such of your readers as have ponds in their grounds, or any pools of ornamental water stocked with fancy water-fowl, it may not be uninteresting to know that Mr. Baxter greatly improves the growth of his flowers and plants by using the home-made guano he collects himself from the margin of the round pond, where the geese and other birds yield him a very good supply, till lately never turned to any account, or thought to be of the slightest use, either to the gardener or any one else. To the poor, who live on commons where geese are plentiful, this hint may suggest a profitable employment of their children occasionally, for during an entire winter they might collect a considerable quantity, either to sell or to add vigour to their spring operations in their homely gardens.—*James Mangles.*

Hallett's Fertiliser.—Having heard of Dr. Hallett's Fertiliser, I this spring sent for one ton of it, and from what experience I have had with it, it has given me general satisfaction. I have been experimenting with various kinds of manures, but the Fertiliser proves itself to be superior to all of them in causing plants to grow rapidly. I sowed some early stone Turnips on the same day, and on the same piece of ground, side by side. Those manured with the Fertiliser are now fit for taking up, while the others, dressed with bones and farm-yard manure, are just commencing to form roots. The ground dressed with the Fertiliser has always been remarkably moist during the whole of this dry season. We had no rain here from the 2d of March until St. Swithin's Day. I have tried the Fertiliser with advantage on Fuchsias, Pelargoniums, Cape bulbs, Heaths, Dahlias, &c., as well as on vegetables of all kinds. For plants in pots I use it in a liquid state; I have also tried it with equally good effect on Vines and on Melons, which promise well. About two years ago I planted Acorns of evergreen Oak, in pots, and during last year they made shoots 3 or 4 inches long; this year I shifted them into larger pots; I watered some of them with the Fertiliser, and they have made shoots 2 feet in length; whilst others, watered with pure water only, have not made shoots more than 6 or 8 inches long; they have both received precisely the same management in every other respect. To any one who may be disposed to call, I shall be happy to show the results of my experiments.—*John Willis, Guernsey.*

Manures.—I observe in the *Chronicle* remarks on the great value of nitrous or azotic compounds in manure. Now we know that the French, when driven to it by necessity, in the beginning of the late war, contrived to form nitre-beds, and to furnish themselves with sufficient for making gunpowder. The peasants in Sweden (*vide* Dr. Ure's Dictionary of Arts, p. 886), have all of them nitre-beds. Might not every farmer in this country have his nitre-bed, in the same way as gardeners have their mushroom-beds?—with this difference only, that when earth has once acquired the chemical tendency to produce nitre, it does not seem to lose it again when washed, but still retains sufficient of the leaven (if I may so call it), to attract the proper ingredients from the air. May not the true theory of composts be, that they are in fact very weak nitre-beds? This appears to me a subject worthy of your attention, and an article now and then on the best mode of making the beds, might do good, and above all lead to the general preservation of that most invaluable article household urine, which, I apprehend, would be found (together with soap-suds), one of the best ingredients of the nitre-bed.—*Horticole.*

Local Horticultural Societies.—At p. 525, there is an appeal from a "Gardener, Dartmouth," severely reflecting on the Torbay Horticultural Society. Had your correspondent made more particular inquiries before writing such unfounded aspersions, his veracity might have escaped the severe shock it must now encounter. No jobbing gardener of Dartmouth gained an extra prize at our last Exhibition for Martynia fragrans. The plants in question, the property of the Hon. Mrs. Hare, Gunfield Lodge, were raised by the Exhibitor, and had attained their high state of perfection under his care and attention. They were exhibited through the kind permission of Mrs. Hare as decorative plants; and were awarded an extra prize by the special permission of the committee, because the Judges considered them the best-grown plants in the room.—*The Secretary of the Torbay Horticultural Society.*

Labourers' Shows.—Will you permit me to suggest that Shows may be very beneficially made for the poor, where neither funds nor supplies can furnish one for the rich? I came into this parish about 12 years since. My labouring classes were very inefficient gardeners. I considered that a Show of common fruits and vegetables, with small prizes, would excite their attention. For this purpose I published a list of rewards for such exertions; and as I had obtained two pieces of land to let out in allotments, I gave prizes to those who cultivated these with the greatest care. The effect has been prodigious. The articles brought to the first Show would have excited your smiles; those now brought, your commendation. My cottagers may compete with most of their class—all the result of this simple measure. Several of my wealthier neighbours have kindly sent specimens of fruits, &c., to lay on a side or honorary table. From these my poor people learned to know what skill and industry could effect; they have attempted similar things, and with success. I inclose a list of the prizes I annually offer. We can only make one Show in the year; July is considered the most suitable month, and the day is fixed earlier or later, as the season is forward or backward.

	s.	d.
To the occupiers of the best cultivated allotments in Dennis's Flat and Sadler's (each)	5	0
To the occupiers of the next best cultivated allotments (in each of the above)	2	6
For the best plate of early Potatoes (six in number)	2	6
For the next best	1	0
For the best summer Cabbage	2	6
For the next best	1	0
For the best Lettuce	2	6
For the six best Turnips	2	6
For the 12 best Gooseberries, all from one tree	2	6
For the 12 next best, all from one tree	1	0
For the 12 best bunches of red Currants, all from the same tree	2	6
For the 12 best bunches of white Currants, all from the same tree	2	6
For the best Nosegay or Bunch of Flowers, of various sorts, all from the same garden	2	6
For the next best ditto	1	0
For the best bunch of Roses, all from one garden	2	6
For the best bunch of Stocks, raised from seed, and by one gardener	2	6
For the 6 best Onions raised from seed	1	0
For the 6 next best ditto	2	6
For the 6 best Carrots	2	6
For the 6 best Parsnips	2	6
For the best brace of Cucumbers	1	0
For the next best ditto		
For the 12 best Strawberries raised by the same cultivator	2	6

The Candidates must be labouring Cottagers, and the flowers and vegetables grown in the parish of Lane-end.

—*J. Peers, Lane-end, High Wycombe.*

Cabul Melons.—On reading the Leading Article at p. 571 of the *Gardeners' Chronicle* for 1843, I remember being greatly surprised at your recommending to everybody who values his dessert to expel the whole race of Cantaloupes and Rock Melons as unworthy of a modern garden. Surely, said I, some of these must have behaved very badly to deserve so severe a sentence, for in my younger days a Cantaloupe or Rock Melon was esteemed a most luscious fruit; and I, for one, cannot consent to banish them altogether, until I have further evidence to prove that they are really so very inferior to the Melons of the East. I was very desirous to obtain some seed, and this season I had the good for-

tune to have my wishes gratified by a gentleman in this neighbourhood, who presented me with four seeds he had received direct from his brother, an officer in the Indian army, and one of the survivors of the Cabul affair. I need scarcely say that I grew them with great care, and was not a little pleased on perceiving one of the fruit exhibit signs of approaching ripeness. On tasting it I must freely acknowledge that, notwithstanding the little partiality I entertained for my old favourites, I found there was almost as much difference between them and the Cabul Melon, as there is between a Morello and a May Duke Cherry. The fruit proved to be remarkably handsome, of an oval shape, slightly netted, and tinged with yellow previous to becoming ripe. The flesh was white, with a greenish tinge, apparently firm, but melted in the mouth like a lump of sugar. The skin was thin, and on this account the fruit as it approaches maturity requires to be narrowly watched, as it is apt to crack and shortly afterwards begin to decay. I am now of opinion that these Melons, in the course of a few years, will supersede the very best kinds that are at present in cultivation.—*M. E. H.*

Scorching Effects of the Sun.—Without entering into the present controversy as to the cause of the spots on Vine leaves, I beg to state the following facts:—Last year I was rather profuse in syringing my Vines, particularly so on two or three occasions, when a hot sun fell on the glass before the moisture had evaporated. All the leaves became more or less spotted, and to this injury I impute the imperfect colour of my Hamburgh Grapes that season. This year I have been very sparing of the syringe, especially when the sun was out. My vinery has not a diseased leaf, whilst the Grapes are as black as sloes.—*A Subscriber, Maidstone.*

COUNTRY SHOWS.

The Coppice, Nottingham.—We had long promised ourselves a visit to the Open Show of Carnations and Picotees, which was to be held at the Coppice, near Nottingham, on the 6th inst., to form our own opinion of the flowers raised, and the style of exhibiting by the men of the "North Countrie." Accordingly, we put ourselves inside a second class carriage (though the morn was singularly auspicious), and were in about three hours brought to the Derby station. We had not much time to survey those extensive buildings, as a train was in readiness to bring us forward, and after changing vehicles, and joining several florists who had arrived by the North Midland, and bound to the same destination as ourselves, we were again (after a few awful grunts and a tremendous squeak) dragged forward towards Nottingham. This distance was speedily traversed through a highly cultivated country; we caught glimpses of the "tortuous Derwent," and "the noble Trent," as we dashed forward, till at length we neared the town. The first object that caught our eye was the Castle standing on the verge of a rock, rising abruptly from the River Leew, which runs at its base. It undoubtedly has been an ornament to the town, but now (though at a distance it is an imposing object) it presents a sad memento, with its dilapidated and scorched walls, of unappeasable rage and popular fury. We were told that there Charles I. raised his head when about to proceed against the parliamentary forces, and a large cavalry was pointed out to us as Mortimer's Hole, but ours was a brief space to view the noble wreck, and on emerging from the station house, our first question was, "the way to the Coppice?" This question we had not to repeat, for the Committee with praiseworthy foresight, had caused placards, with a large hand pointing the way, to be put up at each turn, and though the lower part of Nottingham put us much in mind of a labyrinth, still with this clue we threaded the maze to perfection, and soon found ourselves on the opposite side of the town. A good mile and a half brought us to our destination, and here we may state that we have seldom seen a situation more adapted for the purpose intended. On getting up the hill we found a large marquee erected on the lawn in front of the house, with other conveniences for the accommodation of visitors. We found many florists congregated there, who were not exhibitors, all engaged in discussing the properties, varieties, &c. of the universal favourite, the Carnation. We noticed Messrs. Norman, of Woolwich; Orson, of Grantham; Holland, of Mugeleton, Boone, of Burslem; &c., &c. After some little delay the flowers were staged, and about 12 o'clock the Judges, Messrs. Magglestone, Mart, and Beardsley, of Nottingham, with Mr. Cowper, of York, entered on their duties; and as it was supposed that it would at least take two hours to go through them, we were anxious to look round us, more especially as the Coppice comprises part of the original forest of "Merrie Sherwoode." With our host we ascended a hill at the back of the house, and there we had a most splendid view of the surrounding country to our right; at a distance of 22 miles we saw the princely castle of Belvoir, the residence of the Duke of Rutland. Stretching away to the left, the eye roved over the wilds of Charnwood Forest, whilst in the middle distance the Trent glided through the valley, its silver stream glittering in the occasional sun-beams, which, despite the rough morning, struggled through the clouds. Well, indeed, could we appreciate the fertility of the "Vale of Trent," watered as it is by so fine a river. Like a panorama lay Nottingham beneath our feet, and on either side were the artisans' gardens, looking at a distance like a "giant's draught-board." We understand that there are at least 5 00 of these square inclosures around the town: to us it was a most pleasing sight, feeling, as we do, the rational enjoyment, the fund of health, that these small gardens must afford to their possessors. On descending we found that the Judges had not yet concluded; our host then pointed out at the foot of the hill on which his house stands, "St. Ann's Well," a spring of unusually clear and cold water, and to which great sanctity was formerly attached. On the opposite hill, before the axe had devastated the forest which covered it, stood "Thorney Wood," once the favourite haunt of the far-famed outlaw Robin Hood. Here tradition states he held his sylvan court, and with his "merrie men" performed their surprising feats. Drayton in his "Poly Olbion," Song xxvi., states:—

"From wealthy Abbots' chests and churches abundant store,
What oftentimes he took he shared amongst the poor;
No Lordly Bishop came in lusty Robin's way,
To him before he went, but for his pass must pay.
The widow in distress he graciously relieved,
And remedied the wrongs of many a virgin grieved."

Many were the legends that occurred to us whilst on this ancient domain; but we must take leave of Robin and his recollections, for half-past two had now arrived, and the Judges had decided on their verdict, by which Mr. Wm. Hepton, of York, won both cups, one for *Picotees*, and one for *Carnations*. Mr. Lodge, of Manchester, took the second prize for *Carnations*, and Mr. Joseph Gibbens, of Bramcote, near Nottingham, the third. Mr. Thomas Gibbens, of Bramcote, near Nottingham, was awarded the second pan of Picotees, and Mr. Pearson, of Nottingham, the third. From what we could see, the Nottingham flowers were undersized; accounted for by the Show being fixed too late for them—in fact we were informed that they were all 2d and 3d blooms. Mr. Hepton's flowers were certainly "well done;" we particularly admired amongst his Picotees, Ely's Field Marshal, which, though thin for the South, is a noble flower; Ely's Grace Darling, P. P., and Green's Queen Victoria. Your *Picotee*, with Wood's Queen Victoria, R. P., were also in first-rate style. In Mr. Thomas Gibbens's pan, Naul Secundus, P. P., and John's Prince Albert, P. P., were remarkably fine; and Wilson's Fanny Irby, R.P., and Robinson's Hero of Nottingham, were all that could be wished, whilst in Mr. Pearson's pan, Barnard's Mrs. Barnard was quite a gem. Of the *Carnations*, the Lion of the Day (or Lioness if you like), was Ely's Lovely Ann; this was, indeed, the very perfection of Rose Flakes, and excited universal admiration. Hepworth's True Briton was finely marked, though the flower was rather damaged: whilst those safe flowers, Ely's Mango, P.F.; Ely's Lady Ely, R.F.; Wilson's William the Fourth, P.; Greasley's Brougham, C.B.; and Ely's Jolly Dragoon, S.B., were (to use an old Derby grower's expression) "toppers." For our own part, we had a decided *penchant* for some of Mr. Lodge's flowers. His Royal Briton, S.B., was a first-rate flower, and must be seen to be appreciated; Ely's Caxton, C.B., was rather thin, but beautifully marked; whilst Euclid and Beauty of Woodhouse were in extra condition, and Rob Roy and Beauty of Cradley, S.F., were as fine as could well be imagined. Amongst the losing pans were noticed the following in splendid condition:—Ely's Lord Milton, C.B.; Hufton's Patriarch, S.B.; Ely's Lady Gardiner, R.F.; Ely's Lord Morpeth, S.F.; Simpson's Marquis of Granby, S.F.; Pollard's First-Rate, P.F.; Martin's Splendid, S.B.; Brabbin's Squire Meynell, P.F.; Hufton's Ivanoe, R.F. We subjoin a list of the winning flowers.—*Carnations.*—1. Mr. W. Hepton, with Hepworth's True Briton, Ely's Jolly Dragoon, Hufton's Wellington, Greasley's Lord Brougham, Wilson's Wm. IV., Leighton's Prince George, Ely's Lady Ely, Ely's Lovely Ann, Ely's Mango, Leighton's Bellerophon. 2. Mr. Lodge, with Lodge's Royal Briton, Ely's Jolly Dragoon, Smith's Rooms bury, Ely's Wm. Caxton, Mansley's Euclid, —— Beauty of Woodhouse, Orson's Rob Roy, Wade's Beauty of Cradley, Ely's Lovely Ann, Ely's Lady Ely; 3. Mr. J. Gibbens, with Hufton's Patriarch, Hales's Prince Albert, Ely's Lord Milton, Greaseley's Lord Brougham, Ely's Volunteer, Orson's Rob Roy, Fullen's Queen of England, Greaseley's Village Maid, Millwood's Premier, Squire's Meynell. *Picotees*—1. Mr. W. Hepton, with Gidden's Vespasian, Ely's Grace Darling, Ely's Field Marshal, Ely's Dr. Horner, Green's Queen Victoria, Keesley's Rosea, Wood's Queen Victoria, Sharp's Hector, Wilson's John Bull, Ely's Criterion; 2. Mr. J. Gibbens, with Mark Anthony, Gidden's Teazer, Naul Secundus, John's Prince Albert, Wilson's Fanny Irby, Green's Victoria, Nottingham Hero, Venus, Miss Hunter, Boothman's Victoria. 3. Mr. Pearson, with Queen of England, Mrs. Barnard, Fanny Irby, Marchioness of Exeter, Pickering's Confederate, Sharp's Wellington, Derby Willow, Naul Secundus, Field Marshal, and Hero of Nottingham.

Garden Memoranda.

Standish's Nursery, Bagshot.—To those who are desirous of studying economy in floriculture, a visit to this nursery will be amply repaid, and afford satisfactory evidence of the perfect practicability of cultivating many highly ornamental tribes of flowering plants at a cost trifling compared with the usual outlay. Mr. S. has erected a house for the cultivation of Fuchsias and Calceolarias; it is covered with light canvas, prepared with Whitney's composition. This has been found to answer every purpose desired, and especially in bright sunny summer weather, whilst the plants are growing rapidly, when a mellowed light is so necessary. Instead of a brick parapet for the frame-work to rest upon, a low wall is made of heath-turfs, which, becoming baked with the hot sun, are almost impervious to moisture, and perfectly effective in keeping out the heaviest rains. The walls of the pit in the interior of the house are also constructed of dry turfs. There are, likewise, several pits built and covered with similar materials, in which are grown Camellias, Indian Azaleas, Heaths, &c. The house is heated by a small boiler and gutters formed of paving-tiles, which, besides being cheap, occupy very little more space than an ordinary hot-water pipe, and no more fuel is required to maintain the necessary temperature during winter, than would be consumed in a glass-house of similar dimensions. Amongst Fuchsias I noticed excellent specimens of Lowryi, a small-leaved slender-growing variety, with very bright scarlet calyx and deep purple corolla; an improvement on Formosa elegans, Magnifica, the pretty little Venus Victrix, Halley's King John, and Sanguinea nivea, two varieties with the habit of Chandleri; Antagonist, a seedling of last year with a robust habit, and leaves similar to those of F. cordifolia, the sepals of the flower being short and of a bright scarlet, and the rich violet petals large and neatly rounded; Attractor, remarkable for its short sepals and the large size of the corolla; Colossus is an immense flower, with the colours of the calyx and corolla very distinct; President is another superior variety, less robust growing than the last, but flowering more profusely. Many Calceolarias are still in bloom, but the flowers are much inferior in size and colour to those produced a month or two ago; sufficient, however, may yet be seen to form some idea of their respective merits, taking the advanced state of the season into consideration. Mr. S. annually raises several thousand seedlings, and has procured many varieties with well-formed and curiously marbled flowers. Of those with a cream-coloured ground variously marked with purple of different shades, Fancy, Celebration, Delicata, and Running Rein, may be mentioned as deserving of note; and Guercino, King of Saxony, Holdeniana, Acme, and the Great Western, amongst those marbled with crimson on a yellow ground. It would be fruitless to attempt to convey a distinct idea of each by description, where the arrangement of the markings is almost as endless as the changes of the kaleidoscope. In the out-door department the chief attraction consists of an extensive variety of Perpetual Roses, which are flowering profusely. Among the best are a number of crimson hybrids, such as Madame Laffay, Princess Ellen, Prince Albert, Lady Fordwich, William Jesse, Queen, and Marshal Soult. Of Bourbons there is also a choice collection, many of the best of which were not flowering; Celimene, a fine soft-blush, Queen, a large salmon-pink, and Bouquet de Montmorency, were perfect masses of flower. A variety, with deep crimson flowers, called Bosse, is eminently appropriate for planting in borders, being of a dwarf growth, and expanding flowers in succession throughout the summer season. The plants all appear to be in a healthy thriving condition, and make firm wood and abundance of roots, but the flowers are generally rather small. This may be partly attributed to the excessively dry season, and partly owing to the nature of the soil, which is almost wholly a sandy peat, retaining moisture much better than a majority of earths, and whilst it affords a constant supply of nourishment, never exciting to coarse luxuriant growth.—*Q.*

Baroness Rothschild, Gunnersbury.—The success of Mr. Mills, at this place, in his Cucumber growing, is remarkable. We have seen just now two fruit, straight as a rammod, rodless, black spined, with the blossom on the end, one of which was 22 and the other 21 inches long. They are grown in one of Mr. Mills's improved pits, heated by a boiler and tanks furnished by Burbidge and Healy.

Miscellaneous.

Prize Roses.—We observe by the Inverness and Elgin papers that the first Prizes for Roses, both at the Inverness and Elgin Shows, were awarded to Alexander Urquhart, Esq., at Woodpark, in this neighbourhood. At Inverness for the following cut Roses, viz.:—Fabvier, Napoleon, Archduke Charles, and Desprèaux; at Elgin, for Eugene Beauharnais, Napoleon, Eclatante, Ne plus Ultra, Lady Stuart, Aurora, Madame Bureau, Archduke Charles, 29th Juillet, Madame Breon, Clara Sylvan, and Bougere. The last named tea-scented variety is one of the most magnificent Roses ever grown.—*Forres Gazette.*

Analysis of the Ashes of Potatoes.—These consist, according to M. Vogel, of 17·5 per cent. insoluble and 82·5 soluble salts. The former consist of 9 per cent. phosphate of lime, with some phosphate of magnesia, alumina and peroxide of iron, and of 8·5 per cent. carbonate of lime, with some carbonate of magnesia; there is no silica present. The latter consist principally of alkaline carbonates, sulphates and phosphates (5·33 phosphates, 6·95 sulphates), and traces of metallic chlorides. The soda constantly amounts to 1 per cent. more than the potash.—*Ann. de Chim et Pharm.*, xlix. p. 245.

The Hepaticas.—There are many beautiful varieties of the Hepatica in M. Van Houtte's collection, at Ghent. Some are rose-coloured, red carmine, pale lilac, and white flesh-coloured, with many other tints, among which is even repeated the colour of the stamens. Each of these varieties has a different name; they are still new, and quoted at a high price in the catalogues of this fine establishment.—*Revue Horticole.*

Carbonate of Soda in the Preparation of Coffee.—M. Pleischel states from experience, that the infusion of roasted Coffee acquires a far superior taste, and is rendered more concentrated, consequently that a much larger amount of beverage can be prepared from the same quantity of Coffee, by adding to the boiling water, just before pouring it over the Coffee, 1 gr. of crystallised carbonate of soda for every cup, or 2½ grs. for every half ounce of Coffee.—*Med. Jahrb. des Oestr. St.*, 1843, *October.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Such plants as will flower this autumn may yet be well supplied with water, and occasionally with liquid manure, but all other [illegible] shortly after this time, and it should be performed early in the day. The house may be shut up early in the afternoon, even with a strong sun-heat. At this season, when plants are ripening off, a high night temperature is not so requisite to them as when they are beginning to grow in spring. In dull weather a gentle fire may be used in the day time, so that plenty of air may be given to the plants.

Conservatory.—Should the flowers of Wigelia rosea be too much [illegible], in a good old border, and more agreeable to this house now than in any other, as it is generally occupied at this season with a mixed collection of flowering plants, many of which are pot plants from the stove or hot-house, which require but little water in a low temperature. Cinerarias, Violets, Chinese Primroses, both Chrysanthemums, and all other plants that will flower at this time of Christmas, must be duly attended to; and such annuals as have been proved to bloom in pots in the spring should now be sown. Since, however, the practice of forcing flowers in spring has become general, these annuals have been discarded in many places, as they occupy room where better things can be withdrawn.

Pits and Frames.—These are now fully occupied with half-hardy plants which grow freely in such places in the autumn; the lights should be drawn off at night but let down, but defended them particularly from heavy showers or continuous rain; at the same time admit large portions of air, by tilting the lights at top and bottom. This is a good time to pot Camellias for blooming in the spring, and also to graft them in close frames, without artificial heat.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

It is gratifying, when so many gardeners are complaining of the unfavourableness of the season for flower gardening, to find that there are some in the country who have no cause to complain. I am, however, afraid that those who speak of "present appearances" forget what their gardens were like from the middle of May until the 1st of July; which is a most material consideration in discussing the general effect of a season. As far as my correspondence extends, and it is by no means limited, all are complaining, and I know that if the season near the metropolis has not been a bad one, I for one am not desirous of knowing what a bad season is. However, this is not the place for discussion, but when all have expressed their opinions I may then probably be induced to reply. Scarlet Pelargoniums now require to be propagated as expeditiously as possible; some of them, more especially the strong growing varieties, are very liable to rot off after they are put in the soil, most especially if the season is wet, for that reason it is an excellent plan to allow the cuttings to dry for a day or two after they are prepared before they are put in the ground. The foot of a south wall is an excellent place to strike the most succulent kinds. Smith's Emperor, Prince Albert, the Globe Compactum, and Brighton Hero, are the best of the strong growing varieties. The Frogmore and Cooper's Scarlet maintain their places in some collections, and though deficient in foliage they

are very profuse bloomers; but unquestionably the finest dwarf Pelargonium in existence is that which has this season been exhibited under the name of "General Tom Thumb." It grows almost prostrate, is exceedingly rich and dense in foliage, and produces with the greatest profusion large trusses of the most dazzling scarlet flowers imaginable. I have a plant at this moment nine inches high, and six feet in circumference, studded with twenty seven trusses of expanded bloom, and some of the trusses are six inches in diameter; and on five plants there are upwards of 1.0 trusses of flowers. Another fine variety is one which I got from a nurseryman in spring, under the name of "King." It is very bright in colour, the habit dwarf, and the trusses large. The Huntsman is also a desirable variety for bedding out. The above are the best sorts which I have met with. I have heard of better, but I have yet to see them.

Chrysanthemums—Must now be layered, either giving them a twist, or making an incision on the under side before they are pegged down. Those intended for the greenhouse may be layered in pots, and they will sustain no check from removal, that is if they are gradually severed from the old plants. Give them plenty of liquid manure after they have formed roots.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Carnations.—The seed-pods of the first blooms must now be well watched, and the calyx slit down to avoid the accumulation of wet. It will be a good plan to allow them to hang downwards. Apparently this will be a good season for seed, and from the right direction given to the cultivation and impregnation of these beautiful flowers, we certainly are sanguine in soon seeing an improved breed. Many of the old varieties of Picotee will this autumn be discarded, serrated edges being a sad blemish. The amateur will do well to look about him for some of the newer and better varieties to supply their places. We learn from the Midland Counties that Rose Picotees, which hitherto have been looked on slightingly, are coming into favour. The only matter of surprise with us is how they have been neglected so long. *Pinks.*—Seed must be gathered; half of what we have this year saved will be sown immediately, and the other half next June. Shoots, slipped off and dibbled in sand and leaf-soil, and kept moist and shaded, will root well. *Tulips.*—The bed for next season's planting must be often turned, to sweeten by exposure to sun and air. The bulbs also may be examined, and any alteration made in the arrangement of the roots, according to memorandums made in blooming time. Discard all bad and inferior varieties, those with foul cups and pointed petals, &c. &c. *Auriculas*—must be kept free from decayed leaves, and the pots regularly supplied with water. *Pansies.*—Seed may still be sown. Young plants should be pricked out in beds, as should also any self-sown seedlings worth saving. *Dahlias.*—Thin out strong growing sorts, and pull off deformed buds as they appear.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—It is to be regretted that so few of those who have been growing Pines over tanks have published the result of their experience. In the absence of something better, I will state what I find to be good practice with plants intended for fruiting during January and February. The tank pit must be got in readiness by putting into it a foot and a half or two feet of fresh leaves or tan, according to the size of the pots, or the distance of the pit from the glass. I then select the plants, and shift them into pots from 16 to 18 inches wide, and one foot deep, the sides of the pots being perforated with about 12 holes, each about an inch and a half in diameter, and placed at regular distances. Over the drainage I place a layer of Couch-grass roots, and then some lumpy loam. On this I place the ball of the plant, as entire as possible, and then fill the pot up with good sound loam, without any manure, except a small proportion of flaky leaf-mould. They are then plunged in the tan, or leaves, to within one inch of the rim. By January the roots will be found to be coming through the holes into the bed; I then clear away the tan six inches round the side of the pots, and to the whole depth of the pots, and replace it with turfy loam and rough leaf-mould. Over this I place as much new tan as the lower leaves of the plants will admit of, so as to bring the heat as much to the surface as possible; one disadvantage of turning the plants out into soil over tanks being that the heat does not rise freely through the soil to the surface, where the best roots should be. It will be easily seen that the use of this kind of pot has all the advantage of the turning-out system, and at the same time meets the objections of those who complain—not without reason—of not having sufficient control over their plants when turned out, in such cases as their not coming into fruit when expected, &c. If the weather continue cloudy, but warm, give plenty of air to the growing plants, to prevent their drawing. Proceed without delay with the potting of all plants requiring it.

Vines.—This damp weather will make it necessary to use every precaution to prevent an undue degree of moisture where Grapes are ripening, or ripe. Make a little fire during the day, and give some top air. Stop all useless growths in the late houses. Do not remove the leaves of the Vines, to expose the fruit to the sun, unless they are very thick, and under the whole surface of the glass. No leaves will require removing now, if they have been properly attended to at the time of regulating and thinning the shoots and spurs in the spring.

Peach-house.—Little is required here now, except to give as much air as possible, where the lights are kept on the house, to water where necessary, and to wash the trees frequently with the syringe, to free them from insects and dust.

Figs.—See former Calendars.

Melons.—During this damp weather, Melons will require close attention to the removal of decaying or superfluous leaves and shoots. Give air, if possible, every day; and light a little fire, to keep up the temperature, and drive off damp. They will require very little water now at the roots.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Fruit.—The present dull weather, however favourable to the destruction of the red spider, is not at all favourable for the maturation of fruit, or of imparting to it a rich flavour. The bunches of Grapes might be inclosed in half-globes of glass, which may be obtained at any glass-blowing establishment; and any spare lights of framing or Peach-houses might now be profitably fixed against favourite Vines or Peach-trees. Where wasps or flies are troublesome, the fruit may be defended with gauze or thin bunting; but where much attention to ripening the wood is necessary, nothing is better than covering each fruit very thinly with cotton wadding. The heavy rains we have now had will prevent wasps being very troublesome for some time.

Cauliflowers.—Make arrangements to sow seed thinly now, about the 26th, and again in the first week in September. The first will supply a few early heads, but they will require a good deal of protection. I chiefly depend on the September sowing, keeping them as hardy as possible during winter, not denying them a little frost; and then, by keeping the glasses pretty close, and covering up on cold nights in spring, I get the heads as early as from plants sown now, with the advantage of scarcely ever having a head starting prematurely. Plant out a good breadth of those sown in June and July; you will find them more thought of, if you can protect them during winter, than any sorts of Broccoli. *Lettuces.*—Sow now and at the end of the month for winter and early spring supply. For this purpose, the Brown Dutch and hardy Hammersmith are the best Cabbages; the black-seeded white, and the different varieties of the Brown Bath, are the best Cos varieties. A black seeded variety of the latter, sent out by the Messrs. Lane, is the hardiest for standing the winter, and the longest in running to seed in the summer that I have met with. Keep planting out succession crops. *Carrots.*—Sow a small bed now and at the end of the month for drawing young in winter and spring. *Mushrooms.*—Keep collecting horse-droppings and cow-dung, and get them dried as well as you can for beds in sheds, or houses. Where shed or house-room is deficient, and there is a scarcity of material for large beds in winter, it will be a good plan to make a slight bed or two in a sheltered place now. For this purpose nothing is preferable to the half-reduced dung from an old lining in rather a dry state. If built in the ridge form, from two to three feet in width at bottom, and the same in height, and firmly beat together and defended from heavy rains, it may be spawned, earthed, and bearing, before a larger bed could be safely covered in. This is rare weather for field Mushrooms, but many gentlemen object to their going to their table; and this is no wonder when one sees the poisonous rubbish that is eaten, in defiance of warning.—*R.F.*

VII.—COTTAGERS' GARDENS.

About this time in favourable seasons the cottage garden becomes an object of interest and beauty. Many of its gayest ornaments, such as Hollyhocks, Dahlias, Lobelias, &c., are now in perfection, and will require some attention. All strong growing plants should be tied up so as to prevent them from being broken in stormy weather. In doing this, however, they should not be bundled together so as to disfigure them by giving them a stiff and formal appearance; on the contrary, the stems and branches should be kept as much as possible in their natural position, and they should be tied so as to conceal the stakes that support them. Continue to keep any fruit-trees that are trained against the walls neatly fastened in, as by this means the wood gets better ripened, and the fruit receives a greater supply of light and air. Vines should be regularly attended to; thin the bunches, and regulate the shoots, stopping back all the laterals to one joint. Where those formerly stopped have made a second growth, they must be shortened back as before. If the weather is favourable, a small patch of Onions had better be sown during the week on some rich, light piece of ground, for winter and spring use. The White Lisbon being very hardy, is a good sort for the purpose. Any ground becoming vacant, by the removal of other crops, may still be planted with winter Greens. If a small quantity of Broccoli is planted about this time, or a little later, it will form a succession to the main crop, and will be found very useful. A bed of Carrots may also be sown now for use next May. Last year I made two sowings of Lettuces, one on the 20th of August, the other on the 15th of September; both sowings did well; the latter came into use about a month later than the first sowing, and formed an excellent succession. If a small quantity of Stock seed is put in now, and the plants carefully taken up and potted when they have advanced a little in growth, they will be useful for ornamenting either the window or flower border in spring. They may be preserved over winter with very little protection. If a stock of Verbenas, Petunias, Scarlet Pelargoniums, and such other showy plants as are readily propagated can be kept over winter, cuttings of them should now be got in. If inserted about this time into a light sandy soil, covered with a hand-glass, and shaded from the sun, they will soon become well rooted, and be in good condition for standing the winter before it arrives.—*J. M'H.*

State of the Weather near London for the week ending Aug. 15, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 21st, 1835—therm. 83°; and the lowest on the 20th, 1839—therm. 37°.

Notices to Correspondents.

Books.—*A. Z.*—Loudon's "Encyclopædia of Plants" refers to garden plants as well as wild ones, and is most useful for the former. Lindley's "Synopsis" will probably answer your purpose best. British Ferns are not generally grown for sale, but the London nurserymen can any of them obtain such species as are buyable.——*Maidstone.*—"Howitt's Rural Life in Germany," and "Murray's Handbook for Germany." We are not acquainted with such books for the Channel Islands. It is impossible to say how much cheaper these countries are than England. All depends upon the way of living. They are, however, *very* much cheaper.

Carnations.—*An Amateur.*—Good general directions for the cultivation of the Carnation will be found in the 19th No. of the "Florists' Journal," in Wakeling's "Florists' Guide," and in other Floricultural publications.*——*S. H.*—Refer to vol. i. p. 430; vol. iii. p. 191, and you will find the information you require.*

Carnations and Picotees.—*H. H.*—We recommend you the following sorts:—*Scarlet bizarres*: Twitchett's Don John, Headley's William Cobbett, Ely's Lord Durham, Strong's Duke of York, Willmer's Conquering Hero, and Ely's Lord Pollington. *Crimson bizarres*: Puxley's Prince Albert, Ely's Duke of Bedford, Wakefield's Paul Pry, Holmes's Count Paulina, Cartwright's Rainbow, and Mansley's Robert Burns. *Scarlet Flakes*: Addenbrook's Lydia, Chadwick's Brilliant, Willmer's Hero of Middlesex, Greaseley's Mary Anne, Wiggs's Earl of Leicester, and Wilson's William IV. *Purple Flakes*: Mansley's Beauty of Woodhouse, Pollard's First-Rate, Millwood's Premier, Willmer's Solander, Ely's John Wright, Ely's Mango. *Rose Flakes*: Brooks's Flora's Garland, Wilson's Harriet, Greaseley's Village Maid, Pearson's Madame Mara, Willmer's Endymion, Dalton's Lancashire Lass. Picotees, *purple edged*: Kirtland's Princess Augusta, Dickson's Trip to Cambridge, Crask's Queen Victoria, Wilson's Pluperfect, John's Prince Albert, Brinkler's Purple Perfection. *Red edged*: Gidden's Teaser, Sharp's Gem, Wildman's Isabella, Sharp's Duke of Wellington, Hector, and Gem. *Rose edged*: Garratt's Lady Dacre, Willmer's Princess Royal, Barnard's Mrs. Barnard, Green's Queen Victoria, Sykes's Eliza, and Barraud's Bride.*

Earwigs.—*E. G.*—The best general means of ridding yourself of Earwigs is by putting a little Moss at the bottom of small garden-pots, which should be supported on garden-sticks; and by laying about joints of withered Hemlock or Bean-stalks; to these the insects will retire. They should be examined daily, and destroyed. Although you may not be able to extirpate them entirely by this means (it being a winged insect), you will thin their ranks very much.*

Cats.—*W. K. W.*—A person cannot justify killing the cat any more than he can the dog of another. If, however, in the case in question, the cat were seen in the act of killing or attacking, or carrying off a pigeon, it might be destroyed. *W.*

Exhibitions.—*A Simpleton* inquires whether if a prize is offered for 24 varieties of greenhouse plants, at any public Exhibition of flowers, &c., it would be right on the part of the person exhibiting to include in the number one Achimenes longiflora and one A. grandiflora, or two varieties of any other kind of plants? We answer yes.

Freckles.—*An Old Subscriber.*—They say that Elder-flower-water or Bean-flower-water will remove them; but we have not much faith in the remedy.

Grafting.—*Puer.*—We suppose you allude to these lines—

"More wondrous change; ripe Apples grow on Pears,
The grafted Plum vermilion Cherries bears."

This is true; but Apples do not *stand* well if worked on Pears. The rule, that like only can be grafted upon like, is not here infringed; for similitude does not signify identity.

Insects.—*Entomologos.*—Your pupa of the Emperor moth has been infested with parasites, but as they have all hatched, it is impossible to determine the species; neither can we give you the name of the spider unless you send a specimen. *R.*——*L. T.*—The subject is too difficult to decide upon without repeated examination upon the spot. All we can do is to offer to tell you what the insects are if you detect any, and will send us specimens, protected from pressure; should you succeed, it is far from improbable we shall find the red spider is the cause of the mischief. *R.*

Laurustinus.—*A. B.*—These may be struck from cuttings of the young wood put in about the end of August or beginning of September. They should be put under a handglass in a shady, rather damp situation, and treated like the common China Rose, when it is struck from cuttings.¶

Local Horticultural Societies.—*T. L.*—Much obliged. We will notice this matter next week.

Mildew.—*A Constant Subscriber.*—We should say that your Peach-fruit is attacked by disease in consequence of damp and cold. More sun and air would, in that case, be the remedy. You will easily judge whether this is likely to be the cause. The fruit is more rotten than mildewed.

Names of Plants.—*M.*—Basella alba?——*An Amateur.*—Eutoca viscida.——*S. W.*—Epipactis latifolia.——*A Lady.*—By no means Humea elegans, but Verbena canescens, or some such miserable species.——*W. W.*—Your Rose appears to be the Yellow China.——*Impatiens.*—Origanum Majorana.——*W.*—Alstrœmerias next week.——*J. M. W.*—Cotyledon umbilicus, not lutens. Veronica verna apparently; if not, we will say so next week.——*E. L.*—It is impossible to name fragments. The leaves may have belonged to a Sesbania.

Names of Fruit.—*R. N.*—Mirobalan or Cherry Plum.‖

Peas.—*John Horsfall.*—Your Pea, with pods destitute of tough lining, is the Sugar Pea. The London nurserymen can most probably supply it. It is the Pois sans Parchemin of the French.‖

Pelargoniums.—*C. G. H.*—The following are the principal sorts with sweet-scented leaves:—Citriodorum, Prince of Orange, Emily, Fair Ellen, Bagshot Park, Oak-leaf; rose-scented, and the balm-scented.*

Pomegranates.—*G. Thorburn.*—We are acquainted with your Pomegranate, but only from Chinese drawings. It is a fine thing when it flowers, and we congratulate you on possessing it. The Chinese have several beautiful varieties of this plant. It has no name that we know of.

Transparent Varnishes.—*J. H.*—Your letter is an advertisement.

Miscellaneous.—*F. Rodigas.*—Gratias. Icones haud coram nobis depictas nunquam edimus.——*Aliquis.*—There is no objection to having your stove to face the south east.‡——*M. Saul.*—The Ash is a mere stunted form of the common kind, and of no importance. ¶——*Pilgarlick.*—Not seeds at all; but flowers of the Blue Melilot.——*An Amateur.*—Flower-seeds can be obtained from the Horticultural Society's Garden only by members.‡——*A. B.*—A young man who wishes to enter the Chiswick or Kew Gardens, should proceed by making application to the gardeners.‡——*G. Mathews.*—We recommend you to plant Mandevilla suaveolens for training up the rafters of your greenhouse.‡

SEEDLING FLOWERS.

Fuchsias.—*G. H. N.*—We have examined your collection of Seedling Fuchsias; they are generally small, and are not equal to the sorts generally to be found in collections. No. 3 is the prettiest; this arises from its having so much green in the sepals.*——*Greena-wic.*—From your blooms being put in a box without anything damp about them, they were completely dried up by the time they reached us.*

Lobelias.—*A. Verschaffelt.*—Neither fusca, with dingy purple, nor formosa, with rose-coloured flowers, are showy enough for England. L. mutabilis is, however, really a fine thing, with deep lapis lazuli blue flowers, the size of L. siphilitica, and a pair of clear white stripes in the middle of the lower lip. We recommend you to propagate this one.

Pansies.—*C. B.*—There are several Pansies in cultivation superior to No. 1, the eye of which is not good, and the centre wants clearness; 2 is a promising flower, being well formed, flat, with the colours clear and distinct.*

Pelargoniums.—*W. G.*—Your seedling scarlet is very brilliant in colour; it depends entirely upon the habit of the plant whether it is a desirable variety for cultivation.*——*An Old Subscriber.*—Your seedling, *Kate*, wants form and substance; it is very pretty in colour and marking.*

Picotees.—*G. H. N.*—Your Picotee named *Leafield Scarlet* is a showy flower, the white good, and colour bright; it will make an excellent border variety, but it is not sufficiently good for a stand.*

Petunias.—*W. G.*—Your seedling is a pretty, delicate pink flower, but it possesses no decided novelty to recommend it for general cultivation.*——*J. J.*—The state in which your specimens arrived rendered it impossible for us to form an opinion of them; they require to be packed up in something damp; Moss is easily procured, and is as good a medium as any we know.*——*Anonymous.*—8 seedlings, all common in colour and character, and not differing from the sorts generally to be seen in cultivation.*——*J. M.*—Your seedling is a well-formed and very pretty flower, (blue-lilac veins upon a French white ground); we have seen varieties similar to your specimen, raised this season, and sent for opinion.*——*O. G.*—Of your specimens, Nos. 4 and 7 are not sufficiently distinct from the old sorts generally cultivated; No. 1, a brilliant crimson, and 2, crimson with a tinge of purple, are both good varieties; 3, 5, and 6, are good flowers with light corollas, and dark tubes and veins, but they are too much alike, and bear too great a resemblance to others; 8, a good white, with lilac-purple tube; 9, dark centre, light pink, with strong veins; 10, very large white, with deep blue tube slightly veined; the three latter flowers, with 1 and 2, are desirable flowers of good texture.*——*J. S. S.*—Thanks for the blooms; the spotting was not so distinct as in the former specimens.*

Phlox.—*A. Verschaffelt.*—Your seedlings are very inferior to Van Houttei, and not fine or distinct enough for the English market. Insignis has pale lilac flowers, with a violet eye; venusta is very like it, but much paler, and disposed to have parti-coloured petals; versicolor has larger flowers, with a pale eye; and tener is like the last, but much smaller.

Verbenas.—*T. C.*—Your seedling is too varied in tint; it opens of a rose-colour; the edge of the flower fades from exposure, leaving the rosy colour round the tube only from the variation in the colour. We consider the flower not effective.*

*** As usual, many communications have been received too late.

MANURES.—The Readers of the *Gardeners' Chron.* [illegible] the [illegible] of Manures, and which are now [illegible] to a [illegible] extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention [illegible] to his method of [illegible] Manures, by which a genuine article is secured, as supplying Manures, by which a genuine article is secured, as supplying Manures, by which a genuine article is secured, as supplying

ping, but it is generally understood that *three* Corn crops shall not follow in succession. The Wheat crop is on an average about 18 bushels per acre; the Red Straw Lammas is the kind chiefly sown. It is almost universally drilled in. The Wheat crop is followed by Oats, or in some few instances by Barley. The average Oat crop varies from four to five quarters, that of the Barley crop is in general less than thirty bushels. The Oat stubble is pared and burnt in autumn, and after two ploughings the land is sown to Turnips or Swedes in May or June. This is still generally done broast-cast, but the practice of bouting and drilling is gradually becoming more general. The Turnip crop is not, on an average, above 12 tons to the acre. This low average is, perhaps, partly owing to the circumstance that no horse-hoes or drill-harrows are used to stir the land during the growth of the crop, and also, to the practice of not thinning them out sufficiently. This is the only crop in the course where dung is applied to the land. The Turnip crop, with the exception of a small portion of it, which is carted home for the labouring oxen, or for any fatting oxen that the farmer may have, is eaten on the land by the sheep. This prepares it for the Barley crop, which is sown after a single furrow in the months of April or May. Clover seeds, with the common Rye Grass, are sown with the Barley. They in general remain two years on the land: an average crop of about 15 cwt. of Hay is cut. After lying down two years, the land is ploughed up for Wheat, which is sown about the beginning of September, either on a single furrow or after a double ploughing. The first furrow in the latter case is called *rafteriny*, that is, the land is half ploughed, each furrow-slice being laid on its breadth of fast land. This is dragged and harrowed, and a second furrow is then taken. The plough in common use is the Beverstone wheel-plough, having a wooden mould-board. It is drawn either by three horses or four oxen. Besides these crops, one-sixth part of the farm is, in general, in Saintfoin each year. This is almost useful plant to the hill farmer. The soil of the Bath-stone is well suited for it; and large crops are grown where Clover would fail. It is sown and kept down for six or seven years—as long, in fact, as it will remain in the land. When the land is once tired of it, it is long before it will grow it again, and thirty or forty years are generally made to intervene before a second crop is taken. Immense crops of it are frequently cut during the first two or three years; 40 and 50 cwt. per acre have been cut under these circumstances. It is always broken up for Turnips or Swedes, and, being pared and burnt, a thick coat of ashes is laid over the land. In some parts of this district, a system of burning is followed, which is termed stifle-burning, by which, according to the testimony of those who adopt it, the crop of Turnips is greatly increased, without any additional expense of cultivation. This way of performing the operation, as it was told me, has at length falsified the old proverb, that "Burning, though good for the father, is bad for the son." It consists in laying earth around the heap of Couch, Stubble, &c., to such an extent, that the combustion is retarded though not stopt altogether. The vegetable matter is thus preserved, and, instead of being sent to the winds in smoke, is chiefly returned to the soil. This seems to be the reason of its superiority to the old plan. With regard to the labour of the farm, about one-half of the ploughing is performed by ox-teams, four in each, and one-half by horses, three in each team. The oxen are in general bred on the farm, put to work when three years old, and either sold as working oxen or sent to the butcher, after an attempt to fatten them, when five years old. Four teams, it is calculated, will plough three acres a day; and certainly, considering the shallowness of the furrow, this is a light day's work. With the exception of ploughing and general farm work, all other labour is generally done by the piece. Thus, hoeing the Wheat in spring is let at 4*s.* an acre; hoeing the Turnip crop three times, at perhaps 10*s.*, and paring Oat-stubble, at 8*s.* an acre. Men and boys only are employed, except at harvest-time. Women are seldom seen in the fields at work with the hoe in their hands, although it might be more economically done if they were employed. This is certainly the best cultivated of any of the formations occurring within the district; and although the resources of the soil have certainly not yet been driven to their utmost stretch, they have been driven harder than those of the soil of any other district we shall have to mention. There is also a much greater degree of interest taken by the farmers in this district in the progress of agriculture generally than there is anywhere else on the district. There has been a great step taken here in the improvement of agricultural practice within the last century. This district was, not 100 years ago, one uninclosed common, let to farmers at 1*s.* an acre, who sublet it to others. It was broken up once in five or six years, and a crop of Oats taken, seldom exceeding double the quantity of the seed sown. The land lay inactive during the intervals between these crops, and it was overrun by a few sheep, which in some degree kept down the Couch which there flourished. The generation which saw the Turnip introduced has hardly yet gone by. The farmers who were condemned for attempting its growth out of the garden have hardly disappeared. Since then the land has been inclosed, and the Turnip and the Swede have taken that place which they must ever do in any good system of farming.—*M. S.*

DRAINAGE OF SURFACE-WATER FROM HEAVY LAND.

The very various and conflicting opinions as to what is perfect drainage, convince me that practice without theory is like a ship without a compass—dangerous, uncertain, and expensive. Having cut, during the past year, with good effect, sixty miles of drain, I will describe its action, and state what I consider to be the true theories of perfect drainage.

My operation being different to the usual custom, I beg to submit my theories and practice for discussion, approval, or disproof. The question of drainage is far too important to remain longer in abeyance. The Royal Agricultural Society will do an essential public good by deciding the point.

Theory.—That in perfect drainage, twelve hours' rain should percolate and leave the land, in less than twelve hours from the time the drains begin to act, the difference in time being equivalent to the proportion of water the earth chooses to retain for its use by capillary attraction.

That to effect this, the subterranean area of porosity, *i. e.* the surface of the drains, should nearly equal the surface to be drained, so that if the space to be drained were one square yard, the sides and top of the drain should present an area for percolation equal to nine superficial feet, minus the allowance for pressure.

That the continuance of water in the soil longer than it would remain by capillary retention, is injurious.

That the earth and roots will abstract from the passing water those gases for which they have an affinity, and in which they may be deficient.

That the form of drain should be deep and narrow, as affording the greatest area of porosity at the smallest cost, increasing the quantity of porous earth, available to roots.

That the material for filling the drains should comprise the greatest durability with the least power of capillary attraction.

That where pipes are used, their material should be durable but porous; their form not round or square, but a very narrow and deep oblong, the object being to get a large area of porosity.

That small, round, hard pebble-stones, with a pipe over them, as used on my farm, seem to present all the advantages desired, viz., the impossibility of choking by superincumbent earth, resistance of pressure from the sides, absence of capillary attraction; the round hard stones having but little mechanical affinity for the water, and offering but small resistance to its passage.

That the passage of water in a pipe or drain is always quicker than its percolation through the earth or material of the pipe.

That no drain should much exceed 100 yards in length (fifty or sixty would be better), without opening into a leading drain of greater dimensions. If the drain were in any part full, it would delay percolation.

That neither Bushes, Straw, or other perishable material, should ever be used in a drain.

That the deeper the drainage, the better the crops; but in no case should any portion of the drain be nearer to the surface than 18 inches.

There should be a leader to every 300 yards of drains, giving it ample capacity.

That there should be an open ditch, without fence, for every seven or eight acres drained. The absence of an occasional open ditch is what renders so much drainage useless. Long continuous narrow streets, without frequent outlets, get frequently obstructed; the same may be said of drains—a full drain with a slow egress sadly retards the filtration of water. Drains should be never more than half full of water—the other half air. In this way the superior weight of water causes proper filtration by displacement of air and replacement of water by quick passage.

That the rapidity of percolation depends on the subterranean area of porosity and the depth of drain combined. Shallow drains want a greater area of porosity than deeper ones; because (as water presses equally on all sides towards the vacant space in the drain) the deeper the drain the greater the weight and column of water. Consequently, the greater the pressure the more rapid the filtration: filtration at two feet will be double that at one—at four feet four times as great, and so on in proportion to the superincumbent weight of water pressing equally on all sides towards the drain. It is on this principle that deep pipe drains act quicker and lay dry a greater extent of ground than shallow ones—consequently, the deeper your drainage, the smaller may be your area of subterranean porosity. Pipes at the depth of five feet would hardly need stones, the pressure being about two-and-a-half pounds on every square inch at first; and as the water escapes and diminishes, so will the drains run slower and slower, in a ratio proportioned to the diminished pressure.

Now, although my drainage is considered the most perfect in the county of Essex, I only consider it one-fifth as perfect as it should be. My drains have one foot of subterranean porosity for every five feet of surface, instead of having five feet: still as it is expensive even so, I must be content with it; and I will assume it to be the minimum of perfect drainage.

During the recent nineteen hours' rain, after a very dry time, the stones and pipes poured out an immense volume of water, which, on the second, third, and fourth day, gradually decreased; proving my calculation correct, for if my drains had been perfect, it would have all run away in seventeen hours, instead of eighty.

On comparing notes with a farming friend of mine, who has bush drains from 200 to 300 yards long, in the same quality land, he said, "I know not what has become of the water, for none has appeared in the ditches;" and he seemed quite surprised at my drains running so much. What is the inference?—that bush and straw drains of great length are perfectly worthless as compared with pipes and stone drains of moderate length.

In fact, on one field I drained about three acres the same time, distance, depth, and soil, with scuds or bands of straw tightly fitted over the vacant space, and find it as compared with the tile and stone drained part, almost useless, so much so, that we shall re-drain it.

The cause of my friend seeing no water is, that it stagnates and remains in the soil, keeping the roots cold, wet, and sour, resulting in late crops and densely working land. I hope, after this, we shall hear no more of scud or bush draining. From the moment our land was ploughed after draining, no water has ever run off the surface, whether in winter or spring, although our fields have a pleasant slope. So far my draining has answered, although I still maintain it is only perfect in degree. It would have been real economy to have spent another 5*l.* per acre, and carried out my theory completely. I am not able to say which answers best, a pipe only, the full size of the drain, or a pipe and stones. The latter I give the preference to, the stones having less capillary attraction. I consider drainage almost as important in a very dry season as in a very wet one. This spring we had a practical illustration of it at Tiptree. The crops never looked yellow as they used to do, but always a healthy green, and the very first rain caused an amazing quick growth. It is very easy to perceive that porous drained land on a cool bottom keeps moist in dry weather, by capillary attraction (like lump sugar resting on moisture). At night the dews fill its surface. No such effects can take place in sodden land, with gaping cracks, and a baked impervious surface.

If I am wrong in my theories or practice, I shall feel obliged to any gentleman who will correct me, my object being to arrive as near perfection as possible. Permanent Grass on very stiff clays must be ploughed up before the drains can act. The impervious pan requires to be broken up. This may be a subject of regret, but it ought not to be; for I quite agree with Mr. Morton, that no permanent Grass can keep so much stock per acre as the Turnip culture and green crops, fed, folded, or stall-fed, nor is it so profitable. Grass land is therefore a national loss, employing less labour, capital, and affording less profit than it would do if cultivated with roots, green crops, and corn.

Drainage of Springs.—This must always be effected by drain-pipes (without stones) fitting into each other so as to form one continuous unbroken channel; half-circular pipes, fitting on each other, are sometimes used; if properly loaded they answer, but are not so secure as the whole pipes.

I think we may lay down as a safe theory:—That as the pressure of water is from below, and frequently as much as fourteen pounds on every square inch, that spring drainage should be deep, so that the superincumbent earth be equal to resisting the pressure on the pipes. That the pipes should be always large enough to contain air as well as water. That no stones, bushes, or straw should be used in spring drains, it being evident the immense pressure I have mentioned would quickly choke them with earth.—*I. J. Mechi*, 4, *Leadenhall-street.*

Home Correspondence.

Drainage: Debenham Farmers' Club.—For the information of your Mid-Lothian contributor, Debenham is a small market town in Suffolk; and there are many farmers in its neighbourhood (and men of education too), who are Goths enough to doubt the efficiency of tile drains, "as done once to last for ever," and still prefer those filled with straw, stubble, or plashings, for clay land. They do not think the tiles will wash away or wear out, but on tenacious soils they often find such a portion of clay worked into the drain as to prevent the water running, where by chance or otherwise they have been induced to try tiles. The drains made in the Suffolk fashion last from 16 to 20 years; and if Mr. Girdwood will take the trouble to look into the Royal Agricultural Society of England's Journal, at Mr. Pusey's Report on Draining, he will find much of the matter of discussion at the Debenham Farmers' Club Meeting recorded in an article by the Rev. C. Hill. Tile-draining having been only tried a very few years, the Suffolk farmers would give as a reason for adhering to their old system, that it has been in use in their county nearly a century, and found very beneficial, long before tiles were even thought of, and they are loth to give up entirely an old friend, who does not lead them into expense more than they are sure of having repaid, and taking up a new comparatively untried and more expensive one. Still if it can be proved that Suffolk farmers can reap any gain from the use of tiles, they will be immediately used for all or nearly all drains even in the Debenham district; and many persons, I am told, are actually using them now, where their landlords are sufficiently liberal to supply them. Of the utility of draining land in an oblique direction, I can state an instance which I witnessed last autumn. Whilst looking over a farm not far from Debenham, where part of a field was drained down every other furrow (of ridges each three yards wide), from top to bottom of the field, and the other part obliquely across the ridges at six yards apart—the field being rather hilly but not steep—I made inquiry why that part drained longitudinally had one wet furrow and one dry one, whilst the other part drained obliquely was all equally dry, as much so as any part of that drained down the furrows. The only answer I could get, and the conclusion I arrived at was, that it being drained obliquely across the field, the surface water ran down each furrow, and fell into the drains as it came to them; and that on the part drawn longitudinally every other furrow had no drain under it to receive the water. As I do not pretend to know how the strata lay, or even

the principle of how water gets into the drains (except that it will run down hill), I am hardened in my predisposition for transverse drains, by practical observation, contrary to the written theories of the day. I have also seen the same result on my own farm in a field drained part each way. On many of the strong clay lands in Suffolk, unless drains are made not further than six or seven yards apart, the water will not draw into them; therefore Suffolk draining becomes more expensive than your Mid-Lothian friend contemplates in his calculation. I believe the Suffolk system is not completely an absurd one, as long leases are not the custom with the small landowners there, and farms frequently change their tenants; and though I am sure in this case to be called an old-fashioned thick-headed Suffolk farmer, defending his customs against modern improvements, I can only plead guilty to a fear of casting away the old broom before I have proved the new one, even though it be recommended by the march-of-intellect-men of the present day; for I have found by experience that their advice is very apt to march the profits off a farm to a very quick tune.—*A Farmer and Valuer, Stowmarket.*

Mr. Johnson's Register of Implements.—With reference to your notice of Mr. Johnson's book of advertisements of agricultural implements, I fear that your readers may be mistaken in expecting it to be a complete Register of Implements shown at the Royal Agricultural Society's Meetings at Southampton. The fact of the matter stands thus:—Mr. Johnson's book contains only the names of 18 makers of implements, while the catalogue of the Society contains 97 names of makers of machines and implements, and is a larger book by 58 pages. I hope in justice to the makers whose implements are not noticed in Mr. Johnson's book, you will give insertion to this.—*A Subscriber.*

Allotment System.—Where this system is carried out with a view to give assistance to the hard-working artisan and labourer, presenting to them an opportunity of employing their spare time, with a prospect of obtaining a profitable return for their industry, the scheme offers great advantages to society at large. The visible change in the habits of the population of a district where the plan is liberally and fairly practised speaks sufficiently in its favour. It is, however, to be feared that it is too often considered a speculation by the landholder, and a means of acquiring a higher rent than is given by the farmer for the same description of land, thus rather burthening the poor man than benefiting him. In many instances another abuse also creeps in, which savours of the Irish middle-man. An individual takes a piece of land at 3*l.* per acre, and lets it out again at 6*l.*, which being far above its value, the poor man cannot pay his rent, and his crops are seized; thus, in many neighbourhoods bringing into disrepute a plan which, in itself, is calculated to do so much good and elevate the character of the lower orders. Cultivation by spade husbandry being superior to the use of the plough, if any difference is made in the rent, justice demands it in favour of the small tenant. Accommodation land close to a town, occupied as a market garden, is, of course, of increased value, in its relative position, compared with that at a greater distance, apportioned to labourers, and to which they have to walk one or two miles, either after a hard day's work, or before they commence their accustomed employment. The quantity of land allowed to the head of a family should never exceed a quarter of an acre, and generally speaking the sixth or eighth is enough. Where the object is merely to assist in housekeeping, and not as a main source of income, mischief arises from granting a man more land than he and his family can till during their leisure hours, and yet not sufficient to maintain them without other assistance. This dependence upon the land interferes with their common vocations, and reduces them to greater distress than they would have experienced without the allotment. Half measures are always bad. By a judicious distribution of lots according to the strength of a family, better cropping and manuring will be insured, rents better paid, and the honest man will not be screwed out of his last farthing to meet the exorbitant demands of his landlord and *protector*. An argument has been used in favour of high rents, viz., "A man need not take the land unless he likes:" and the best answer to this is, "A drowning man will catch at a straw." Where the labour market is over-stocked, any nominal rent may be asked and promised, but the day of reckoning is a proof of how far either party have acted wisely.—*Falcon.*

Rooks.—[We have received the following communications on this subject since the date of No. 28, and we give them in an abridged form.]—In winter, while the weather is fresh, rooks follow the ploughs, which are then almost constantly in motion, to obtain the larvæ and worms turned up by them. In frost and snow they resort to roads and dunghills, and frequently attack stackyards, tearing the thatch from the heads of the stacks, and devouring the exposed grain. They are sometimes, also, known to eat Swedish Turnips, and do some mischief in that way, as the broken bulbs generally fall victims to the frost. The principal damage, however, of which they are guilty in winter is their attacks upon the young Wheat. In spring they certainly do eat grain of various kinds, scattered by the hand of the sower, but not to any great extent. Their principal employment is following the ploughs for insects, &c., and I have no doubt much good is done by them in this way at that season. Nevertheless, the first-sown fields in a district generally require watching by the farmer. In the beginning of summer, when the Potatoes begin to sprout, rooks do a great deal of damage by digging up the sets, and thus completely destroying the plants. The fields must be well looked after at this period by the farmer, and the birds scared away until the plants have attained some size. It is often necessary to watch Potato fields for three weeks and sometimes even for a longer time. In summer, too, especially if the weather be hot and dry, rooks often do some damage to the remaining stacks in the stack-yard, tearing off the thatch, and carrying off whole heads of grain into some neighbouring field to be devoured at more leisure. Pasture-fields, however, are the great resort of these birds in summer, and there they do much good, destroying numbers of grubs and other insects. They often also render a service to the farmer, by spreading abroad, in their search for insects, the droppings of pastured animals, particularly horses, as these, when left alone, produce rank tufts of coarse herbage. Towards the end of summer rooks may sometimes be observed in Turnip-fields, pulling up the young plants; but this, I am of opinion, is merely to get at some lurking insect. In autumn the farmer is again a sufferer from the depredations of the rook. Whenever the corn begins to ripen, it is attacked by flocks of rooks, and much damage is often done, especially in spots where the crops are at all laid. When the grain is cut and stacked, too, they do a good deal of mischief. When the Potato crop is nearly ready for taking up, rooks often attack it, digging into the sides of the drills and extracting whole tubers, and sometimes the farmer is again, as in spring, compelled to have his fields watched. When not engaged in these spoliations, rooks are generally to be found in pastures; or if any ploughs are at work, searching the upturned furrow-slices. In early autumn, too, they very frequently resort to moors and uncultivated ground, most probably in quest of insect food. As far as my experience goes, I am disposed to think that rooks should be encouraged to a certain extent, but that they should not be allowed to become too numerous in any district. Their numbers ought, I think, to be kept under, lest the supply exceed the demand for them, and the rook turn thief at all times, and not now and then merely.—*A. J., Roxburghshire.*——On turning to Bewick, which I have interleaved, I find the following note:—"In the winter of 1829-30 I saw a Barley-stack unroofed, and heard of a cottage in the neighbourhood which had shared a like fate in the course of a few hours. The rooks, driven to this food by the severity of the weather, performed their work of destruction as effectually, though not so deliberately, as the bunting is said to do, by the author of the Journal of a Naturalist.—*Herts.*" This summer I have seen them taking to a new food. A farmer adjoining me had put down several loads of ground bones, but on account of the drought did not spread them. The rooks have been very busy round these loads, and have carried off and dropped in a field belonging to another farmer really a considerable portion of this valuable manure. [They probably attacked the grubs merely, which will breed in a heap of half-rotten bones.] Having thus said what I can against this bird, let me now become his advocate. He only does this mischief when in distress. I do not believe, except under necessity, that he is graminivorous, though I have known him pick up acorns. In confinement he will leave corn for grubs of any kind. Neither, setting aside his destruction of insects, &c., is he altogether an unprofitable bird. As food, two years ago, I saw no less certainly than 200 young rooks given to the poor, and other persons had their share. I would certainly say to the farmer, the rook is your friend, despite some faults;—and who is perfect?—*Cestriensis W.*——In the *Gazette* of June 15th there is an article headed *Rooks*, by "Acer." Its author is evidently a great crow-fancier, or he, surely, would never have taken the radicle of the Oats, preparing to root, for "a wireworm, gorged with the milky substance of the Oat." Any person may satisfy himself of the fact, that all grain, after being cast into the ground a certain time, shows "a white streak, extended lengthwise." I cannot see any cruelty in killing these black robbers, so convinced am I of the injury they do to the crops. I have no reason for doubting that the evil they do to the farmer so far overbalances any good they may do, that it would stand in the ratio of 99 to 1, from one year's end to the other. I am not so fortunate as to be "owner of a considerable rookery;" yet, being in possession of a patch of ground in the shape of a small farm, I have had frequent opportunities of quarrelling with these birds—being placed about midway between two considerable camps of the enemy, which harass me on every side. In spring, when sowing commences, the damage they do is great; next come the Potatoes, which suffer in their turn after the grain crops have got beyond them; next the Turnips in their season suffer (this being the scarcest time of food for them in the whole year, winter excepted), so that they are forced to turn up manure in the drills in search, doubtless, of wire-worms, &c., and thus they root out the Turnip plants, and ruin the crop; next comes the early-ripened grain, the first thing in the shape of plenty that they have had for some time—they luxuriate in the midst of this all harvest time; but when the fields are well nigh cleared of grain, then commences their second period of famine, and they are ready to pour down in myriads on the patches of Wheat that are here and there sown through the country, (this is not properly a Wheat-growing country). Lately the birds have begun to make havoc on Turnip fields during winter, principally among the yellow and Swedish kinds, by picking holes in the bulbs, and thereby admitting water, air, and frost to them. Last winter I did not know a single Turnip field but what suffered less or more, and it was no uncommon thing to see whole fields where not a single Turnip of any considerable size had escaped them. I am convinced that there is no farmer in the neighbourhood but what suffers from 10 to 20 per cent. of loss upon his crops by the depredations of these birds: in my own case, for the last 12 months I am quite sure that I would not have suffered half so much, though I had had all the wire-worms in the county of Forfar to contend against, instead of the harmless rooks, as "Acer" would have them to be.—*Peel, Loch Lintathan, Angus.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover-square, on Wednesday, the 7th of August; present, T. Raymond Barker, Esq., in the chair; Col. Austen; D. Barclay, Esq., M.P.; F. Burke, Esq.; J. Kinder, Esq.; J. Parkes, Esq.; J. A. Ransome, Esq.; and Prof. Sewell.

The Earl of Egmont, of Enmore Castle, near Ashmore, Somersetshire; and John Quantock, Esq., of Norton House, near Yeovil, Somersetshire, were elected Governors, and the following gentlemen Members of the Society:—

Henderson, Colonel, Mayor of Southampton
Curtis, William, Netheravon House, Amesbury, Wilts.
Davis, Robert, East Woodhay, Newbury, Berks.
Gurney, Charles, Launceston, Cornwall
Hobby, D. Peter, Colquita, Bodmin, Cornwall
Drew, John Watkins, Southampton
Young, George Fegar, Bread Chalk, Wilton, Wilts.
Sidford, George, Bishopstone, Wilton, Wilts.
Newton, Thomas F., Dogdean, Salisbury
Cousins, Robert, Norton Farm, Sutton-Scotney, Hants.
Gilbert, Major, Bartley Lodge, Southampton
Fanshaw, Rev. Charles Simon, Trinity Church, Southampton
Taylor, John Oddin, Hardingham, Norwich
Powell, Colonel W. E., Nanteos, Aberystwith, S.W.
Harvey, Thomas, Kegilnack, Falmouth, Cornwall
Johnston, Charles, Caramont, Cheshunt, Herts.
Boileau, Sir J. P., Bart., Ketteringham, Wymondham, Norfolk
Toomer, James, Rhinefield Lodge, Lyndhurst, Hants.
Long, John, Marwell Hall, Twyford, Winchester
Bonser, William James, Merton, Surrey
Edwards, Thomas, Compton House, Stockbridge, Hants.
Lysoght, Admiral Arthur, Southsea Portsmouth.
Glover, Rev. Frederick, R. A., Rector of Charlton, Dover
Bury, Edward, Hanslope Park, Newport-Pagnel, Bucks.
Dorchester, Lord, Greywill, Odiham, Hants.
Talbot, C. R. Mansel, M.P., Margam Park, Neath, S.W.
Kemp, James, C., Liverpool
Smallpiece, Job, Compton, Guildford, Surrey
Smallpiece, William Haydon, Guildford, Surrey
Haydon, Joseph, Guildford, Surrey
Campbell, Major T. E. (7th, or Queen's Own Hussars), Kenilworth, Warwickshire
Martin, F. P. Broumcker, Compton House, Salisbury
St. Germans, Earl of, Port Eliot, Devonport
Campbell, John H., Exton, Bishop's Waltham, Hants.
Dowding, John, Wick, Worcester
Drummond, Henry, Albury Park, Guildford, Surrey
Gosling, Thomas, 10, Chandos-street, Cavendish-square
De Grey, Hon. Brownlow N. Osborn, Fawley, Southampton
De Grey, Hon. and Rev. Frederick, Copdock Rectory, Ipswich
De Grey, Hon. George, Fawley, Southampton
Damen, John Angel, New Farm, Winfrith, Dorchester, Dorset
Owen, William, Blesington, Ireland
Barwell, E. R., Southampton
Speke, William, Jordans, Ilminster, Somerset
Tinker, William, Conock House, Devizes, Wilts.
Hocken, Rev. William, Great Endelion, Camelford, Cornwall
Jolliffe, Sir William G. H., Bart., M.P., Heath House, Petersfield
Clarke, Charles, Aisthorpe House, Lincoln
Sanders, S., Fernhill, Newport, Isle of Wight
Coles, Colonel, Wells, Somerset
Burrell, Walter, 5, Richmond-terrace, Whitehall
Hooper, George, jun., Cottington, Deal, Kent
Lushington, Sir Henry, Bart., 32, Montague-square, London
Piggott, Simon Frazer, Fitzhall, Midhurst, Sussex
Floyer, John, Hints, Tamworth, Staffordshire.

Finances.—The Chairman of the Finance Committee laid before the Council the Monthly Report of the state of the funds of the Society to the end of the past month; from which it appeared that the current cash balance in the hands of Messrs. Drummond at that time (including a residue of 300*l.* on account of the subscription of 1000*l.* received from the town of Southampton) amounted to 2858*l.*; and the capital invested in the public funds to 7700*l.*: the Council, before leaving Southampton, having defrayed the expenses of the London police, amounting to 125*l.*, and placed at the disposal of the stewards and director of the yard, out of the deposit of 3308*l.*, in the hands of Messrs. Maddison and Pearce, the Society's Local Bankers, the sum of 1000*l.*, to meet the immediate claims of a miscellaneous character connected with that department. The Council then proceeded to vote the discharge of the following claims, as recommended by the Finance Committee:—

	£
Contract for the Yards and Pavilion at Southampton (balance of account)	1751
Do. Council Dinner	405
Do. Pavilion	566
Prizes awarded at Southampton	1315
Mileage, &c., to the Judges of the Show	354
Miscellaneous Bills connected with the Southampton Meeting	60
Books for the Library	154
Binding and Carriage of Journal	160
Miscellaneous Bills on general account	286
Total	£5051

Trial of Implements.—Communications in reference to the trial of implements at Southampton, were received from Mr. Burke, Mr. Smart, Mr. Clayton, and Mr. Comins, and were referred to the Stewards of that department. The Secretary was directed to communicate with the Judges of Implements, and request them to furnish the Council with a statement of the implements submitted to trial; of the results of such experiments as were made; and, generally, with an expression of their motives for their respective awards; together with a notice of such implements as may, in their opinion, deserve special commendation or encouragement.

Veterinary Science.—1. *New Epidemic.*—Prof. Sewell reported to the Council upon a letter referred to

him at a former meeting, received from Mr. James Dixon, of White Moss-farm, Cheshire. In that communication Mr. Dixon stated that until he had adopted the treatment of bleeding his cows immediately on their being attacked with the prevailing disease (termed the "New Epidemic"), he lost several; but none had died since he had put that measure into operation. He urges at the same time, in the most strenuous manner, that particular care and caution are required to keep a continual watch over the animals, and apply the remedy at the very instant that the symptoms of the disorder make their appearance; as, on this promptness depends all the value of the measure. As soon as the symptoms are perceived, he recommends bleeding without delay. —Professor Sewell informed the Council that this was the practice he had been in the habit of recommending; and he believed that the losses which had been sustained by the owners of animals from this complaint, had arisen more from want of close attention to their condition, and to the first changes in them from health to disease, than from any other cause; and he accordingly took that opportunity of earnestly recommending Mr. Dixon's watchful care over his stock to all other farmers in general. The first principal step of bleeding having been taken in due time, Professor Sewell would recommend the administration of the usual laxative medicines, and the application of external stimulants, to be left to the judgment of the nearest practitioner.

2. *Diseases of Domestic Animals.*—Professor Sewell then reported that the examination at the Royal Veterinary College being concluded for the session, ninety-three pupils had received diplomas; several of whom had also obtained certificates as having attended the lectures and practice on cattle, sheep, and other domestic animals; in which branch of their profession he thought their services to the farmer would be better secured by Agricultural Associations and Farmers' Clubs in the country engaging them, at fixed moderate salaries, to settle in localities where they are most likely to be required. This plan had been adopted with great success on the Continent, but it was there effected as a Government measure, and had become a long established law.

3. *Rabid Animals.*—Professor Sewell informed the Council, that keeping in view the object of the Society's connexion with the Veterinary College, he had decided on devoting the period of his professional recess during the present autumn to a practical inquiry into the most successful means by which the virus of rabid animals may be counteracted, and the fearful results of hydrophobia obviated. He accordingly requested the co-operation of the members in carrying out this inquiry, and would himself willingly pay every expense connected with the sending up to the college, from any part of the country, of such sheep, lambs, or calves, as may unfortunately have been bitten by rabid dogs during the late hot weather, or should become liable to a similar infliction at any future time. He mentioned small ruminating animals only, as being more easily managed when labouring under the worst or most violent symptoms of the disease, than horses, cows, or bullocks, which under such circumstances are not only almost unmanageable, but highly dangerous; and when such were intended to be sent to him, he would feel favoured by a previous notice by letter. The animals thus requested might be conveyed in the ordinary railway trucks or cars, or sent by canal boats. By the latter mode, Professor Sewell had received a heifer from Worcester a few years ago: sheep and lambs have been sent in covered carts; but the most rapid conveyance is preferable. A sheep or two might be put into crates used for earthenware, and the expense of engaging an entire car be thus obviated; while the animals would be less annoying to the railway agents. Should the disease commence on the journey, the animals should be tied by the legs, and be well littered with straw. Net muzzles might be worn, or sent along with the animals in order to be in readiness. Professor Sewell has, however, never had any fear of rabies being produced by the bite of any animals but those of a carnivorous kind, including swine as such. Of all the numerous cases of canine madness he had seen in horses and other animals, he had not observed a single instance in which they were unable or unwilling to drink water freely. He had always found the disease commence (with a single exception) from the third to the sixth week after the bite had been inflicted. If, therefore, it should not manifest itself in the stock sent to him by that time, he would return the animals to their respective owners free of expense. In conclusion, the Professor submitted to the inspection of the Council a series of highly interesting coloured drawings, exhibiting the morbid results on the brain, nerves, and other anatomical structures of the animals which had died from the ravages of hydrophobia; and he trusted that his request might not be considered an irregular one, as he was anxious to effect an immediate communication with the members, and to lose as little time as possible in obtaining objects for his intended research.

English Silk.—Mrs. Whitby, of Newlands, near Lymington, Hampshire, presented to the Society, at a previous meeting of the Council, a specimen of the silk grown and wound off at her residence, along with half a dozen of the cocoons just formed; and favoured the Council with the following interesting narrative of her operations:—

"I have during several years past cultivated the Mulberry (mostly used in climates where silk is grown of the best quality) and fed silkworms upon it with great success. I have had an opinion on the quality of the silk produced from them, which encourages me to hope my example will be followed by others, as a means of profit to the agriculturist, and affording employment to the industrious classes.

"I was led to the undertaking by hearing, in 1835, as I was travelling in the north of Italy, of an English gentleman, 'who had doubled his capital in three years, and who received 10 per cent. on that laid out on a silk establishment near Milan;' and wonder was expressed that the culture had not been tried in England. Agricultural produce had been at a low ebb in England, and it was difficult to find profitable work for the labourer. I determined to try and introduce the cultivation of silk. I saw the young Mulberry-trees in Lombardy blown aside by the force of the N.E. winds, as our forest-trees are here by S.W. gales. At this period, a fog of 33 days' duration had prevailed, and the ground round Milan was covered with snow, and iron-bound with frost. I knew that around Florence the nights were cold, and the weather uncertain, even as late in the spring as the 1st June. Judging from all this that the climate of England was equally favourable to the growth of the Mulberry, I ordered from a nursery-garden at Turin 100 standard trees and 1000 dwarf Mulberry-plants of the sort called —'Of the Philippine Islands' (*Morus multicaulis*). This sort produces much larger leaves than the Italian wild White Mulberry, or that which in England is cultivated for its fruit. Its growth is rapid, and it is easily propagated by cuttings, which strike as readily as the Willow.

"My plants did not arrive in England until April, 1836. I treated them according to the directions given in Mons. Burden's book, and I did not lose one. I even gathered leaves from them the same year. I bought half an ounce of silk-worms' eggs at Novi, which is said to produce the best silk in Italy, and thus laid the foundation of a small establishment, which, I hope, will be the means of spreading the culture of raw silk throughout England, and in the course of years render her independent of foreign resources. I have had no difficulty whatever in rearing the silk-worm. I possess an old loft over an unused stable; in the former I have reared the worm; in the latter I placed a silk reel. Although my cocoons were pronounced "good," and would bear a comparison with the specimens I brought from Italy—although they were exempt from the diseases which I understand carry off at times whole colonies there —although I imported a silk reel from Italy, and went to a great expense in having a scientific apparatus laid down to heat the water, I found insurmountable obstacles in winding off the silk *fit for the loom.* I tried year after year, in vain: it was bright and beautiful to look at: it was pronounced by Mr. Bonorardis, of the firm of Prevost and Co., 24 A, Cateaton-street, to be of "*good quality, and sufficient bone and brightness,* but the winding was without the 3 necessary for the loom." This opinion encouraged me to send to France for a person acquainted with the process; the result you have in the specimens I have sent you. The yellow silk is the growth of this year, the white that of cocoons kept during my many years of trial. I have several pounds already wound off, equally good, and the French girl, aged 19, and another (English) of 15, are now busy at work winding more. All the expense I have incurred in the apparatus above named, is so much money thrown away; the wheel I have imported this year with this young girl from France, is cheap, simple, and effectual; it is also so easy of accomplishment that three of my household can wind with facility, besides a cottager's wife who is employed at six pence a-day to attend upon the worms. The eggs can always be retarded so as not to be hatched before the Mulberry is ready to put forth sufficient food. In France and Italy the hatching begins about the 1st of May; I find a month later preferable. All the books I have read describe a temperature of 75° to be essential. I have proved by eight years' experience that the insects thrive better at one much lower. In damp or cold weather, I have a very small Arnot's stove lighted, which regulates the temperature to from 65° to 70°. Ventilation is more necessary than extreme heat. The expense of this stove is trifling—as indeed is every thing connected with the cultivation of silk. This has been a dry season, and the leaves in consequence fewer and smaller than usual, but the same difficulty has occurred in France, and the father of my little winder writes word, that he was obliged to throw away this year 40,000 worms for lack of food. Mine would have suffered also had not my friends in the neighbourhood assisted in supplying me with leaves of the Red Mulberry. A scarcity of leaves happening occasionally is no proof that it cannot succeed; look around at our fields. Where are the spring crops of Barley and Oats? Where are the Turnips which ought now to make them green? Checks from bad seasons will occasionally happen to every produce of the earth in all countries; but in general the Mulberry of the Philippine Islands grows luxuriantly and multiplies freely in this part of England. The expense of an establishment such as mine would be small: that which I have incurred in my unassisted efforts to succeed must not be considered as necessary by any one willing to take advantage by my experience; and I am so desirous to see the culture of silk become general, that it will give me much pleasure to answer any inquiries you may wish to make, or give any information in my power. I almost fear I shall have tired you with this recital; but I knew not how to make it shorter, so as to be clear and convincing. Be it remembered there was the same prejudice in France as now exists in England against this branch of agriculture; it was attempted to be overcome by Henry IV., but what he tried to enforce by edict became general as it became better known. All I desire is, to make it known, that others may try in other parts of England.—P.S. The worms of this year were reared partly from eggs saved by myself last year, and partly from insects I purchased from Signor Anegoni, 16, Church-st., Soho."

The best thanks of the Council were returned to Mrs. Whitby for the favour of this communication.

Southampton Meeting.—At a Special Council held at Southampton, Mr. Miles, on the part of himself and Mr. Shelley, as Stewards of the Implement Department, reported the unanimous satisfaction of the Implement-makers with their arrangements; when it was moved by Col. Austen, and seconded by the Marquis of Downshire, That the best thanks of the Council be presented to Mr. Miles and Mr. Shelley, for their exertions as Stewards of the Implement Department, and for the trouble they had taken on behalf of the Society in the Implement show-yard, as well as on the trial ground. This motion was carried unanimously.—On the representation of the Earl of Ducie, on behalf of the Implement-makers, it was resolved,—That the exhibitors of implements be permitted to read the corrected proof of Mr. Parkes's Report (prepared for publication in the Journal) in the Society's Rooms, but not to make extracts from it, or publish any part of it.

On the motion of the Hon. Capt. Spencer, it was resolved,—That no castrated or spayed animals be allowed to be exhibited at the Country Shows of the Society.

It was decided,—That in future the business of the Society be adjourned on the Saturday of the previous week, at 4 o'clock in the afternoon, from the office in Hanover-square to the place of the Annual Country Meeting.

Resolutions were passed expressive of the high opinion entertained by the Council of the conduct of the police at the Southampton Meeting.

Shrewsbury Meeting.—The following General Shrewsbury Committee has been appointed by the Council:—Earl Spencer, *Chairman;* Hon. R. H. Clive, M.P., *Vice-Chairman;* Duke of Richmond, Lord Portman, Hon. Capt. Spencer, Col. Austen; D. Barclay, Esq., M.P.; Thos. Raymond Barker, Esq.; Col. Challoner; J. W. Childers, Esq., M.P.; Sir Andrew Corbet, Bt.; John Cotes, Esq.; Jas. Dean, Esq.; C. Emery, Esq.; H. Gibbs, Esq.; B. Gibbs, Esq.; W. Ormsby Gore, Esq., M.P.; W. G. Hayter, Esq., M.P.; W. Fisher Hobbs, Esq.; Sir John V. B. Johnstone, Bt., M.P.; W. Miles, Esq., M.P.; Philip Pusey, Esq., M.P.; R. A. Slaney, Esq.; W. Shaw, Esq.; J. Villiers Shelley, Esq.; H. S. Thompson, Esq.

The following Special Show-yard Committee has also been appointed:—*Chairman*, H. Gibbs, Esq.; *Stewards*, Earl Spencer, Hon. Capt. Spencer, S. Druce, Esq.; W. Miles, Esq., M.P.; J. Villiers Shelley, Esq. Mr. Manning, of 251 High Holborn, has been engaged as contractor of the works for the Show-yard and Pavilion.

Notices of Motion for the Monthly Council in December.

Mr. Fisher Hobbs to move:—

I. That the Journal Committee be requested to prepare—
   1. A printed List of all Members of the Society, with their addresses, for the general use of the Members.
   2. A Catalogue of all Implements, Models, &c., that have been presented to the Society.
   3. The Charter and Bye-Laws.

II. That the Judges shall be appointed by the Council from a list of nominations made by the Members of the Society at large at a General Meeting, and on the report of a Committee to whom such list shall have been referred.

Hon. Capt. Spencer to move:—

I. That Governors and Members of the Council shall have admission, under certain regulations, to inspect the Cattle on the Wednesday, after the Judges have delivered in their awards.

II. That the Council take into their consideration the details connected with the appointment of the Judges.

Mr. Barclay, M.P., to move:—

That at the future Country Meetings of the Society, the Cattle-Show shall be open to Governors and Members of the Council at 3 o'clock on the Wednesday afternoon.

Communications.—The following communications have been received, with the thanks of the Council:—

1 The Right Hon. Sir George Rose, Bt.—Results in the employment of the Hainault Scythe.
2 Capt. Watkins (Bombay Art.)—On Sea-mud as a Fertiliser.
3 Mr. Mechi—Communications on Agricultural Improvement.
4 Mr. Towers—Results of Dibbling Wheat.
5 Mr. Grant—On Fences.
6 Mr. Sheppard—Results in the Use of Guano.
7 Lord Bridport, Mr. Spooner, M.P., and Mr. Curtis—Observations on Insects attacking Green Crops.
8 Mr. Saul—On a Wheat-grub.
9 Mr. Grove—On Australian Barley.
10 Mr. Hayter, M.P., Mr. Stokes, and Mr. Blackburn—On Apparatus for Steaming Food for Cattle.
11 Mr. Dean—On Parochial Allotments and Drainage.
12 Mr. Carson—On Guano.
13 Mr. Bowers—On the Vernon Harcourt Wheat-Hoe.
14 Col. Austen—Communication from M. D'Arblay (Member of the French Chamb. Dep.)—On the subject of his attendance at the Southampton Meeting, and thanks for attention shown to himself and the Baron Mallet.
15 Dr. Ure—Present (on the part of Mr. Knight, of Foster-lane) of one of his Lime-testers.
16 Knight and Thompson—Present of one of their Double Revolving Beehives.
17 Mr. R. Smith—Present of Taper-tiles.
18 Mr. Colman—Present of Transactions of the New York Institute, and further supply of Indian Corn.
19 Mr. Beedham—On Publications against Incendiarism.
20—Mr. Bulmer—Suggestions for the re-publication, in a cheap form, of the best Standard Works on Agriculture, in imitation of the Parker, Camden, and Sydenham Societies.
21—Duke of Richmond—Present of a Report on Border Agriculture.
22—Mr. Fisher Hobbs—Communication from Dr. Baker, on the Inoculation of Pastures.
23 Mr. Briggs—Treatises on the Growth of Wheat, Gypsum, &c.
24 Mr. Pulman—The Western Agriculturist (Axminster) No. I.
25 Mr. Shaw—The Farmers' Magazine.
26 Dr. Daubeny—Lecture on the Education of Farmers.
27 Herring, Burness, and Co.—On Guano Agency.
28 M. Chylinski—On Apiaries in Poland.
29 Lunell and Co.—On Conveyance of Stock by Steamers.
30 Mr. Osborn—Papers connected with the South East Hants Agricultural Society.

31 Mr. Morton—Meteorological Observations in reference to the Prize offered by the Society for the best account of Prognostics of Weather.
32 Mr. Pearse—Present of Back-band and Tug for Gig-horses.
33 Dr. Burgess—Communication on Glanders, &c.
34 Messrs. Morton—On Braby's Draught-machine.
35 Mr. Minta—Paper on the Economy of Manures.
36 Sir Edmund Prideaux, Bt.—On the Promotion of the Objects of the Society.
37 Mr. Sparks—On the Red-water.
38 Earl of Essex—Communication of the Results attending the Employment of Charcoal as a Manure.

Together with Reports of the Beccles Farmers' Club, Chippenham Agricultural Association, and Geological Society of London; Transactions of the Highland and Agricultural Society of Scotland, Jamaica Agricultural Society, and Labourers' Friend Society, Veterinarian, &c. &c.

ADJOURNMENT.—The Chairman declared the Council to stand adjourned at its rising to Wednesday, the 4th of September; and failing a meeting on that day (for want of a requisite quorum), to stand further adjourned to Wednesday, the 6th of November, for the despatch of business. The Council then adjourned accordingly.

HIGHLAND AND AGRICULTURAL SOCIETY.

THE annual great Cattle Show of this Society was held last week in Glasgow. On Wednesday a meeting of the general committee was held, for the purpose of completing the preliminary arrangements for the meeting. The chair was filled by the Earl of Eglintoun. Mr. Campbell having read the report of the local committee, Sir C. Gordon, the secretary, laid upon the table the Society's new medal, and read an abstract of the entries of stocks, which he stated were larger than upon any previous occasion. The number of lots was 1404; amongst which were 222 Ayrshire cattle, 55 West Highland cattle, 160 horses, 117 sheep, 184 lots of butter, 83 lots of cheese, and 176 implements. He believed the largest number ever entered before was 1014, at Edinburgh, in 1842. A dinner took place in the evening at the Trades-hall, and was attended by upwards of 200 noblemen and gentlemen; the Earl of Eglintoun in the chair. Thursday was the day appointed for the show of the stock, dairy produce, implements, &c., and for the allocation of the prizes. As a proof of the immense extent of the present Exhibition, it may be mentioned that the names of the exhibitors occupy no fewer than 87 closely-printed octavo pages, embracing stock, implements, and seeds. Of the Short-horned breed there were no fewer than 29 bulls entered for competition, many of them most splendid specimens.—Of the Short-horned breed there were 15 cows offered for competition; and of these, one belonging to the Duke of Buccleuch, and another shown by Sir T. J. Trafford, of Trafford Park, Lancaster, and bred by Mr. John Forrest, attracted much notice.—In the Ayrshire breed 61 bulls of various ages were shown, the great majority of which were from this and the adjacent western counties. In this class 99 cows were shown, many of them perfect pictures of the breed. There were also some beautiful heifers and oxen among the Ayrshires.—Of the West Highland breed there were 16 bulls exhibited from the counties of Perth, Argyle, Banff, and Dumbarton. The show of Horses gave great satisfaction.—In the class of Stallions alone, not exceeding eight years old, there were 23 competitors. From the counties of Lanark, Renfrew, Stirling, and Ayr, (from the former especially) there were some beautiful animals.—Of entire Colts there were no fewer than 40 shown, and of draught and brood Mares there were 45 competitors, from the counties of Lanark, Renfrew, Dumbarton, Edinburgh, Haddington, Stirling, Ayr, Dumfries, &c.—In the class "Pairs of horses of any age, adapted for agricultural purposes," there were eight competitors, all of them very fine animals.—Of Sheep the entries were very numerous, and under this class a pair of South American Alpacas, accompanied by a young one, two months old, were shown by Mr. A. Garlshore Stirling, of Craybarnet, which were purchased from the stock of the Earl of Derby, in July, 1843.—The Implements exhibited were also numerous beyond all former precedent, and contained many modifications of implements in present use, which may prove highly valuable. The following are the awards in this department:—For the best collection of Agricultural Implements and Machines, ten sovereigns, to Mr. Robert Law, Shettleston, Glasgow, for the best collection; five sovereigns, to Mr. James Wilkie, Uddingstone, for the best workmanship, &c.—For a new and useful Agricultural Implement or Machine that has been satisfactorily tested in actual work, not previously exhibited in competition, seven sovereigns, to Mr. Andrew M'Kerrow, Kilmarnock, for his Antler Plough; and three sovereigns, to Mr. John West, Lundie, for Plough with Apparatus for lifting Potatoes.—For a useful improvement in the construction of Subsoil Ploughs, five sovereigns, to Mr. James Wilkie, Uddingstone, for Subsoil Plough with improved Share.—For a useful improvement in the construction of the common two-horse Plough, which has for its object the lifting and turning over the greatest possible quantity of the soil in a given time, with the least resistance to the draught, and which produces at the same time a fair and efficient surface for exposure or for seed, seven sovereigns, to Messrs. Robert Gray and Sons, Uddingstone; and three sovereigns to Mr. James Wilkie.—For a useful improvement in the construction of Barn Fanners, five sovereigns, to Mr. William Ralston, Musselburgh.—For a useful improvement in Farm Carts and Wheels, five sovereigns, to Mr. Robert Crawford, Uddingstone.—For a useful improvement in the Threshing Machine, seven sovereigns, to Mr. David Craig, Stewarton.—For the most useful improvement in the construction of any of the Implements used in the cultivation of the Turnip and Potato crops, five sovereigns, to said Mr. James Wilkie; two sovereigns to Mr. Alexander Reid, Stewarton; and two sovereigns to Mr. John M'Gill, Sundrum.—For the most useful improvement in any of the Utensils or Machines used in Dairy Husbandry, five sovereigns, to Mr. Robinson, Lisburn, Ireland; and two sovereigns to Mr. Richmond, Salford.—For the most successful introduction of any Machine or Implement that is generally approved of in the practice of Agriculture in England or elsewhere, or a modification of the same, and which has hitherto been but little known or employed in Scotland, five sovereigns, to Mr. William Crosskill, Beverley; and a silver medal to Mr. Houston, Johnstone Castle.—For a Weighing Machine, adapted to general farm purposes, capable of weighing stock or produce, dead or alive, from the weight of a sheep to that of a loaded cart, and which will indicate the addition of one-thousandth part of the mass to be weighed, five sovereigns, to Mr. Thomas M'Cririck, Garallan.—For an improved method, whether patented or not, of manufacturing Drain Tiles or Pipes, whereby the price will be reduced; the Tiles or Pipes to possess the requisite qualities of usefulness and durability, and satisfactory evidence as to the price to be produced, ten sovereigns, to Mr. Etheridge, Southampton.—Besides the above, the Judges awarded various premiums in money and medals for articles not within the range of those specified. On the evening of this day the great dinner of the Society took place in the City Hall; about 1200 gentlemen sat down, presided over by the Duke of Richmond.

FARMERS' CLUBS.

North Cornwall.—At a late monthly meeting of this Club, a large party visited a field on which Mr. J. S. James had tried the effect of covering Grass with layers of Straw. The Straw had been spread over about one-third of the breadth of the field, and through the entire length from east to west. Mr. James caused the Straw to be raked off for some width up and down the line of division, and from several patches in different parts. The difference was very marked: where no Straw had been laid, all the Grasses were thin and short, and the field appeared almost as brown as the soil itself. But where the Straw had been spread, the Grass presented a lively green, and in quantity was thick and matted, corroborating Mr. James's statement of the enormous increase. He had cut and weighed it, and the increase was at the rate of a ton to the acre. The Chairman had brought from Woodley six turfs, in order to show the meeting the effects produced by Strawing the land. He also answered some objections which had been made. The increased growth evidently did not arise from contact, for the high Grass, on which the Straw principally rested, was scarcely at all acted upon. It was also clear that no unfavourable effect was produced in changing the quality of the Grasses; for they retained all their original properties—there was no new Grass, but all were very much improved. That it was not to be attributed to atmospheric influence, or a diminished evaporation from the soil, was proved from the fact that the rush had been equally susceptible of the effect. There was but one question to be solved, and that was the question of agency; the increase in quantity and quality had been proved to demonstration.—A paper was then read by Mr. Shephard, On the System of Cropping in the District—its Defects and Disadvantages, with Practical Hints for its Improvement.—He said, when I proposed to lay before you some remarks on the subject we are met here to discuss, I did not sufficiently reflect that if it were properly treated, it would include a review of nearly all our agriculture. It is a subject of great interest to all, including as it does the means of providing employment for our labourers, and the means of supporting from our own soil a rapidly increasing population. The first course of cropping I shall mention is that adopted in this immediate neighbourhood, viz.:—Potatoes—Wheat—Barley—Clover, the Clover cut for Hay and secondly for seed, the whole of it upon one dressing being planted with Potatoes. This system, confined however to this more immediate neighbourhood, has been in practice ever since my recollection, and still continues. And, notwithstanding the occupiers of the land find its production annually diminishing, they still persevere in the same objectionable course. Possibly, however, this may arise from its affording to the artisans, and the other working men of the town and vicinity, great facilities for getting a few yards of Potatoes annually. I will admit this to be of considerable importance to such parties, and would be the last man to urge anything that would deprive them of the advantage: the system may, nevertheless, be improved without doing this, and I would recommend that instead of Potatoes, Wheat should be the first crop, then Potatoes, and next Barley, which would not only clean the land but give a far better crop alike of Barley and of the seeds after. Another system, which you will find among the farmers who occupy more largely, but which is still more objectionable than the former, is that of first Potatoes or Turnips, then Wheat, Barley, and Oats, or else Wheat, Barley, and Oats, without the previous crop of Potatoes, or Turnips, Wheat, and two Oat-crops; the Oat-crop in either case seeded out, and generally cut for Hay the following year. This is done upon the manuring of the Potato, Turnips, or Wheat—in fact, of the first crop. Now, I ask, can it be possible to pursue any system more ruinous than this? Though the soils in this neighbourhood vary, and consequently require to be differently cropped; yet, let the land be what it may, never take three white crops in succession, nor two after a green crop. If you take two white crops following the green crop, you leave your land in a worse state than when you first broke it. I would recommend those who farm largely, and where there is a mixture of soils, wet and dry, to observe the following mode in preference:—On their dry land where they can grow Barley, to have Wheat, Barley, Turnips, and Barley, manuring for Wheat and Turnips; on those dry lands where they cannot grow a fair crop of Barley, they should have the intermediate crop Potatoes instead of Turnips, because I conceive that all the lands that grow Barley in this neighbourhood are capable of growing Turnips. On their wet lands, where the green crops cannot be grown with advantage, they should have Wheat and Oats, and allow the land to remain out two years. I could wish such farmers to adopt the system I have found indispensable in my own case; to take for instance 60 acres out of their estate, and crop it as I have mentioned, they would have 10 acres of Wheat, 20 of Barley, 10 of Turnips, 10 of seeds, and 10 of Lea, which would be put into Wheat in the autumn of every year. Were they to adopt this system they would find that the rusty appearance of the land in the spring of the year, so characteristic of this neighbourhood, would in a very short time disappear. Some persons, I have observed in the last few years, have adopted a course of cropping, I suppose with a view to profit; I can only hope that for their own sakes they may not be deceived; all depends on the period they remain in their estates,—that is, Wheat, Barley, and Turnips, Wheat, and Barley seeded. It would appear from this that farmers had an objection to see their land too free from weeds; for as soon as they succeed by judicious management in getting a good crop of Turnips, they seem to look with a jealous eye upon the good condition of their land, and again take the two white crops from it. I now come to the system adopted on the moors, which is Wheat and two Oat crops, the last crop partially seeded, and the land allowed to remain out of tillage for years. I am not sure that there are not some farmers who believe that mere rest in Grass is the cause of the land's increase in fertility; but I presume that every person who has studied the matter at all knows that land is enriched, not by rest, but by the quantity of food that cattle consume on it; or, in other words, the quantity of manure it returns. Here, then, there is a great field for improvement; and I am disposed confidently to assert, that were 1000 acres of waste or moor land which we have around us brought under a proper system of cultivation, the two great and desirable objects with which we set out would be attained—that of providing employ for our labourers, and food for our increasing population.

Miscellaneous.

Proper Time to Harvest Wheat.—Some experiments lately made indicate that there may be an improvement as to the usual time of securing the crop. By the Quarterly Journal of the Royal Agricultural Society, it appears that Wheat cut a fortnight before it was ripe produced an increased quantity and weight in flour and straw, with a better quality of both. Mr. John Hannam of North Deighton, near Weatherby, in England, cut a sheaf in his field, August 4, 1840; the Wheat was then green—*i. e.* both the straw and ears were in full vigour and sap; the grain was perfectly formed; but the chaff so strongly adhered to it, that it was scarcely possible to separate them by friction in the hands; it was then plump, but so juicy, that on the slightest pressure it yielded its milk. He let it stand in the field a fortnight, and then housed. On the same day this was done (August 18), he cut another. This, too, was yet green, or at least not ripe, or what is usually termed raw; the straw, though looking green, when closely examined was fast approaching to yellow, and a foot from the ground was quite yellow. The ears, also, were more open; the chaff of various shades of yellow and green; and the grain though soft and pulpy, yet not so full of fluid as before. In a fortnight after, the whole field was ripe, when he cut his third sample (Sept. 1). The same day he housed the second sheaf. This third was not so far ripe that the straw would break, and the ears curl, and the grain shake out; but it was in its usual state when reaping commences, when the straw is entirely yellow. This third sheaf was left (as in the case of the former ones), a fortnight on the field, and then carefully housed. From each sheaf 100 ears were selected and put away in a bag, preserving also the straw of each. On threshing them the following was the result:—

COMPARATIVE WEIGHT.

	Gross Produce.	Equal Measure.	Equal Number of Grains.
No. 1, cut August 4 (green)	756	568	19⅔
No. 2, cut August 18 (raw)	736	550	23¼
No. 3, cut September 1 (ripe)	650	570	22⅔

The comparative weight of the straw was:—

No. 1 (green)	550
No. 2 (raw)	475
No. 3 (ripe)	450

As to the value of the same, by the judgment of an extensive grower, the following was the result:—

No. 1, 61 shillings per quarter, or 1 dollar 67½ per bushel.
No. 2, 64 shillings per quarter, or 1 dollar 76 per bushel.
No. 3, 62 shillings per quarter, or 1 dollar 70½ per bushel.

A miller valued them at the same rate, with the exception of No. 2 at 63 shillings, and No. 3 at 61 shillings. Mr. Hannam's deductions are—that the Wheat reaped a fortnight before it was ripe has the advantage of the ripe in every point of view: 1st, in weight of gross produce, thirteen and one-fifth per cent.; 2d, in weight of equal measures, nearly one-half per cent.; 3d, in weight of equal number of grains, nearly two and one-fifth per cent.; 4th, in quality and value, above three

and one-fourth per cent.; 5th, in weight of straw, five per cent. That reaped a month before it was ripe has the advantage of the ripe 22 per cent. in point of straw; but in other points the disadvantage thus: 1st, weight of gross produce, eleven and five-thirteenths per cent.; 2d, weight of equal measures, rather more than one-third per cent.; 3d, weight of equal number of grains, better than 13 and one-tenth per cent.; 4th, quality and value, rather more than four-fifths per cent. The advantages, then, of cutting the crop a fortnight or so before it is fully ripe may be thus summed up: 1st, straw of better quality; 2d, a better chance of securing the crop; 3d, a saving in securing it. It is stated that, with regard to the crop of 1839 in England, the beginning of the reaping was late, and the result in the North of England was, that fully 75 per cent. of the whole Wheat-crop was damaged. The saving of securing the crop is two-fold: there is less waste in reaping or from strong winds; and the expense of it is said to be less. Mr. Hannam tried another experiment, which showed a result in 100 lbs. of grain grown, as follows:—

	Flour.	Seconds.	Bran.
No. 1 was cut one month before fully ripe .	75lbs	7lbs	17lbs
No. 2 was cut three weeks before fully ripe	76	7	16
No. 3 was cut two weeks before fully ripe	80	5	13
No. 4 was cut one week before fully ripe	77	7	14
No. 5 was cut when ripe	72	11	15

Thus, No. 3 gave more a bushel than No. 5, by six-and-a-half, and a gain of about 15 per cent. on the flour of equal measure of grain. In grinding, it was found that No. 5 ground the worst of all; there were a greater quantity of flinty particles which would not pass the bolt than in any of the others. The bran from No. 5 was coarse and heavy, while that from No. 3 was as "thin as a bee's-wing." He then sums up the advantages of cutting two weeks before it is fully ripe; 1st, there is a gain of 15 per cent. of flour, and equal measure; 2d, a gain in the weight of straw of 14 per cent.; 3d, a gain of 163 in the value of eight bushels, and a gain of about 583 on every acre of Wheat producing 28 bushels—his calculation being founded on the price of Wheat at that time in England. An experiment of cutting the grain ten days earlier than usual was also tried by a farmer in Michigan, on 60 acres—the berry being soft and in the milk; and the result was, that it yielded more flour and less bran than usual. Another advantage of early reaping is stated, on good authority, to be security from rust. A farmer is said to have tried an experiment on this subject. Finding one of his fields of Wheat in a very raw or green state was badly struck with rust, he determined at once to cut it, and did so amid the laugh of his neighbours, who thought him crazy. The fields adjoining suffered little from rust, and stood till fully ripe; yet at threshing, that which was first cut gave the finest Wheat and the best yield.—*Report of Commissioners of Patents, U.S.*

Mr. Borthwick, of Crookstons, Wood-thinner and Tree-pruner.—In the thinning of plantations, or the cutting of trees in any situation, it is always an object of attention, and often of difficulty, to take care that they do not injure other trees, valuable shrubs, or fences, &c., in their fall. In cutting out a Larch or Fir, for instance, from some surrounding Ashes, Elms, or Planes, if this consequence is not provided against, how often has one to regret the smashing of a fine hard-wood tree, or valuable shrubs, or the breaking down of some expensive fence. To provide against such evils, means are taken to make the tree or trees that are cut fall in such a direction as to avoid them. If the trees are of any size, perhaps 20 or 30 years old, or even of less age and growth, it is generally found to be necessary to attach a rope or ropes to the upper part of the tree, to be held and pulled by one or more persons, according to circumstances, so as to cause the tree, when cut, to fall in the proper direction. To accomplish this purpose, it has been customary to employ climbers, or persons to go up the tree by means of a ladder, to fix the ropes; an operation which is attended with much labour, loss of time, danger to the persons employed, and inefficiently, from the difficulty of knotting the rope sufficiently near the top of a tree, which is necessary in order to increase the lever or purchase upon it. The inconvenience of these expedients led me to the invention and adoption of the following instrument:—It consists of a hook, the interior curve of which may vary in size from 4 to 6 or 8 inches in diameter. A ring, attached to it, must be of sufficient size to take in a rope of sufficient strength, say of what is called by the rope-makers from 9 to 18 threads. The handle or shaft, which must not be shorter than 15 or 18 feet, may be made of any light and strong wood, such as the shafts of hay-forks are made of. The hook is provided with a socket, into which the handle is fitted, but is not fastened by any nail. This simple apparatus is carried by the forester's assistant easily in his arm. A proper place, such as the insertion of a branch, is chosen for placing the hook round on the tree to be cut. The rope, which is spliced through the ring of the hook, being unrolled, the shaft is inserted in the socket of the hook, and being held in the hand of the forester or his assistant, the hook is held up by it to the part of the tree selected as most proper to pull from; the hook is put round this part; the handle is then withdrawn from the socket; and, by means of the rope, the hook is pulled firmly into its place by the assistant, who takes his proper position so as to guide the tree, and he continues to pull as the forester advances in cutting the stem of the tree; and, whilst he aids the cutter by widening the opening of the cut, draws the tree over, in the direction wished for, where it gently falls and crashes down, without injury to anything.—*Transactions of the Highland Society.*

Smut in Wheat.—Mr. Bevan made an extended course of experiments in England, which are found in the ninth volume of the "English Agricultural Magazine." He took both sound and smutty grain—the first being designated in the following table of results by the letter A, and the second by the letter B:—

	Number of smutted ears in 3 sheaves.		Bushels of good Wheat per acre.		Cwt. of Straw per acre.	
	A.	B.	A.	B.	A.	B.
Solution of potash . . .	1	81	21.6	13.6	36.6	29.1
Muriate of potash . . .	3	218	20.2	10.1	36.0	21.1
Nitrate of potash, (saltpetre) .	17	115	23.8	14.3	36.0	31.9
Soda	9	159	20.2	11.7	35.6	26.7
Muriate of soda, (com. salt) .	—	290	24.0	14.5	41.5	33 3
Sulphate of soda, (Gl. salts) .	12	241	21.6	12.3	38.5	27.8
Muriate of ammonia, (sal. am.) .	1	150	19.8	17.6	35.4	30.2

Dry, in its natural state . .	—	6.323	20.3	14.7	35.7	31.0
Washed in common water . .	none sown.		10.7	18.3	—	35.8

This course of experiments indicates lime-water to be the most effective. Putsche, in his "German Encyclopædia of Agriculture," gives the following as the receipt of M. Schruitz, of Dürer, in the province of Juliers, in Prussia. So confident was M. Schruitz of its efficacy, that he offered a standing reward of a ducat for every head of smutted Wheat found in his field. For every 500 pounds of seed Wheat, take 1 pound of alum, 1 pound of copperas, ¼ pound of saltpetre, ¼ pound verdigris: pulverise these ingredients, and dissolve them in a sufficient quantity of boiling water. When the solution has become cold, add as much more water as will be required to moisten the whole thoroughly. The heap should be turned several times within the ensuing 24 hours, well mixed: it is then ready for seeding.—*Report of Commissioners of Patents, U.S.*

Selection of Seed Wheat.—An able writer in the Journal of the Royal Agricultural Society of England, in relation to the subject just mentioned, gives the following directions:—"In making a comparative trial with varieties of Wheat, it is necessary to select a portion of land uniform in texture, subsoil, and expense, and which for years has been cropped, manured, and laboured in all respects alike." "The lines of separation (of the varieties) ought to be well defined to guard against the mingling of the different varieties in the operation of sowing and harvesting. I recommend the seed to be deposited by a drill across the ridges, with a vacancy of three feet intervening between the varieties, and the seeding of all the land to be executed on the same day." "Respecting the quantity of seed, I can testify, from experience and observation, that even with the same variety of Wheat, any material difference in the state of the plant, all other circumstances being alike, influences the size of the ear, length of straw, and time of ripening, and the quantity and quality of produce, as well as the effects of red gum and mildew." He says, "a thin plant (*i. e.* a small number of young plants of Wheat standing on a given space of ground) generally enlarges the ears and corn, and retards the ripening, and aggravates the effects of red gum and mildew, while the straw is shortened both by a very thick and a very thin plant. It is therefore desirable, in comparative trials, to have all the varieties of the same thickness of plant." Another source of error which he mentions, is "the different propensity of different Wheats to tiller, or send out side shoots." He recommends, therefore, the trial Wheats to be sown "not by equal measures, but by measures calculated to contain the same number of seeds;" and also that the seeds should be sown "so thick as not to call forth the tillering propensity." He recommends, also, that journals of comparative trials should be kept, "embracing the appearance of the crops at all the different stages of growth, with the weather," or any other influences which may occur. A German writer of great celebrity further recommends that an estimate of the number of kernels of a kind be made by counting the number contained in a small measure, so as to give still greater accuracy to experiments made on this subject. The following are considered, by an authority on this subject in our own country, as suitable characteristics to be taken into consideration in selecting Wheat for our crops:—"1st. The general hardiness of the plant, and capability to resist the Hessian fly, or throwing out by frost and winter-killing, rust, and mildew. 2d. A good strong upright stalk, with just enough straw for the object, and no more. 3d. No beard is desirable; a head filled and heavy, and retaining the grain as long after it is fit to cut as possible. 4th. A predisposition to tiller well. 5th. A plump full berry, capable of yielding a large quantity of white flour, with a large proportion of gluten, and as little bran as possible."—*Report of Commissioners of Patents, U.S.*

Notices to Correspondents.

Analysis.—*J. Hemming.*—We cannot undertake analysis of soils. There are many gentlemen to whom you may apply, as an inspection of our advertising columns will inform you.

Cabbages.—*North Earle.*—The Early York, if sown in a bed now, and transplanted when ready in autumn, will be fit at the time you name.

Disease in Cows, &c.—*J. K.* says that he has had four cows dead lately, of water in the chest and a decay in the lungs; and three calves, of a swelling in the knee and other joints. The cause of death in his cows was in all probability the dreadfully fatal epidemic called *Pleuro-Pneumonia*, which word signifies inflammation both of the substance of the lungs, and also the membrane covering them and lining the interior of the chest. The actual cause of this fatal disease is unknown, but it is doubtless produced by some poisonous gases or effluvia in the atmosphere. Cattle in good condition are more likely to be attacked than others, and in them it is more likely to be fatal. It is believed to be more prevalent in high and inland localities, where the air is keen and bracing, than where the atmosphere is milder. When the disease is thoroughly established, there is but a poor chance for curative treatment. The conflagration is so extensive and rages so fiercely that we cannot put it out. If one half the previous value of the animal can be realised by the carcase, the butcher's knife will be the best resource. In applying a remedy, it is all-important to commence early, when a slight cough or the least impairment of health is perceived. We should then bleed freely, give a dose of Epsom salts (a pound with two drachms of ginger), blister the sides, and put setons in the brisket. If this is delayed till a certain stage, the bleeding will do harm instead of good. The salts and the setons will be advisable as preventives, and the latter should be stimulated with hellebore ointment. If the disease in the calves is confined to the joints and limbs, and the chest is not affected, it is that which is locally denominated joint-evil, and in various districts receives different names. If, however, the chest is affected as in the former disease, we have reason to fear it must be connected with it. If the former disease, it is an inflammation of a rheumatic character of the membrane lining the joints, sheaths of the tendons, and fibres of the muscles, and often flies from one part to another, and baffles all treatment. It is probably owing to exposure to cold and want of shelter, and if the young animal has been very badly kept in the winter, it is more likely to be attacked by the disease the succeeding spring and summer. As to treatment, give a mild purgative, and follow it by ginger, gentian, and spirit of nitrous ether—a quarter of an ounce of each in a pint of warm ale. Rub hartshorn and oil, or a stronger stimulant, on the affected parts, and if the pulse feels strong, bleed. Warmth, shelter, attention, and care, are indispensable.—*W. C. S.*

Drilling Machines.—*θ. φ.*—We know of none answering your description. You had better apply to some first-rate agricultural implement maker. Of course we cannot recommend.

Feeding Cattle.—*A. O.*—Cattle may doubtless be fattened on oil-cake and straw; but the profitableness of your scheme depends so much on the price you would be able to get for your manure, and upon your skill in the purchase and sale of stock, that, in our ignorance of these, we cannot answer your question.

Grass.—*Lumpy.*—Sow early in spring; Alopecurus pratensis 1½ lbs., Avena flavescens ½ lb., Dactylis glomerata 5 lbs., Festuca duriuscula 2 lbs., F. pratensis 2 lbs., Lolium perenne 12 lbs., Poa pratensis 1 lb., Medicago lupulina 1 lb., Trefolium prateum 4 lbs., T. repens 5 lbs., and Rye 1 bushel, per acre. These are the kinds and quantities recommended by Lawson as seed on light soils for permanent pastures. You will have to sow only those in which your pasture is deficient.

Guano.—*I. B. H.*—It will keep uninjured, if kept in a close apartment. Your plant is Melilot Trefoil—Melilotus officinalis. ——*T. White.*—Peat *charcoal* mixed with guano will tend to hinder the escape of ammonia: peat *ashes* will not do so; indeed, if they were mixed when fresh, they might expel the ammonia. The use of guano will not put an end to that of lime; the latter will be required just the same as before. Possibly it may be better to spread the super-phosphate of lime on the young Wheat in spring than to plough it in with the seed in autumn; it will not be so liable to waste. We should be glad to know your experience of this manure.

Liquid Manure.—*R. S. T.*—Throw all this, from the house, into the tank. You may add soot to it; but the cheapest way is to pump the whole over compost heaps of manure, rubbish, soot, &c. The drainings of your yard are valuable as liquid manure.

Suffolk Duns.—Δ wishes that some of our Suffolk correspondents would inform him in what the excellent milking properties of the Suffolk Duns consist—whether in affording large quantities of milk or butter, or both combined? whether they have ever been tried at a distance from their own county, and found to retain these valuable properties, as on consulting some book authorities he finds considerable diversity of opinion to exist.

Tanks.—*R. B.*—Dig a cylindrical hole, say 10 feet deep and 10 feet in diameter, making the bottom basin-shaped; surround it at bottom with brick paving, at the sides with an ordinary stone or brick and mortar wall, ramming clay well down behind it, and at the top with a flat stone and lime dome, leaving an opening by which to enter it, and a sufficient number of small openings round the edge for the liquid to enter it. A pump, communicating by means of pipe and rose, within 1 foot of the bottom, is wanted to complete the work.

White Beetroot.—*A Reader* asks for information about the culture of White Beetroot for sugar, and how far it is likely to succeed under *great heat*, where the soil, however, is rich and a supply of water for irrigation attainable.

Winter Tares.—*No. 5. 5. 7.*—If they are sown in about four weeks' time, we apprehend you may expect a crop in June. The weight of green food it will afford you depends so much on the quality of the land that we can hardly answer your question: it will probably be from 7 to 10 tons per acre.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Aug. 12.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s	2	Best Downs & Half-breds	3s 10 to 4s 0
Best Short Horns	3	8		3 10	Best Long-wools	3 6	3 10
Second quality Beasts	3	0		3 6	Ewes and second quality	3 4	3 6
Calves	3	8		4 4	Lambs	4 0	4 6
Pigs	3	4		4 0		

Beasts, 2741; Sheep and Lambs, 31,860; Calves, 158; Pigs, 289.

The supply of Beasts is much shorter to-day, especially of the best qualities, which experience a rise in price of fully 2d per 8 lbs from last Monday's quotations; the Short-horns are selling much more freely at our top quotations than on Monday last, but very few make anything over 3s 10d per 8 lbs; there is a heavy trade amongst the middling qualities, although they are rather more readily disposed of than of late. There is also rather a less quantity of Sheep, but the number is still considerable; trade is very dull at about last Monday's prices for the best qualities; Ewes and plain Sheep, which are plentiful, do not find so ready a sale as they have done, and make rather less money. Lamb-trade is very heavy. Veal-trade continues steady. Pork is a little more in demand.

Friday, Aug. 16.

The trade for the best Beef is about the same as on Monday; the supply is moderate; some of the best Scots make 4s 2d, but the more general price is 4s, and Short-horns 3s 10d per 8 lbs; middling qualities are still very heavy on hand, and make from 3s to 3s 4d. The Mutton trade is rather improved, there being a good clearance at the dead market, and rather a shorter supply here this morning; there is nearly 2d per 8 lbs advance on the best qualities; second-rate remain about the same. Lamb is no better; the price continues from 4s to 4s 6d, with very few at the latter. Calves are a slow trade, but some of the nicest still make nearly 4s 4d. Pork remains steady, at from 3s 4d to 4s.

Beasts, 751; Sheep and Lambs, 9960; Calves, 348; Pigs, 230.
41, West Smithfield.

HAY.—Per Load of 36 Trusses.

Smithfield, Aug. 15.

WOOL.—British, Friday, Aug. 16.

The Our English Wool Market remains unaltered. The demand is good, but prices have not advanced.

	per lb.			per lb.	
Long-wooled Wethers	1s 0d	to 1s 1d	Southdown Hoggitts	1s 1d	to 1s 3d
Do. Hoggitts	1 1	1 2½	Kent Fleeces	1 1	1 2½
Southdown Fleeces	1 0	1 1			

James Perrin, Wool Broker.

COVENT GARDEN, Aug. 17.—The market has been well supplied during the week with fruit and vegetables of almost every kind; the latter are rather improving. Pine-apples are good, and quite sufficient for the demand. Amongst Grapes are excellent bunches of White Muscat; and Black Hamburghs, in particular, are good. Peaches and Nectarines are rather scarce: forced sorts are nearly over, and those from the open wall are not yet abundantly supplied. Apricots are plentiful, the best bringing about 3s. per dozen. Greengage, Orlean, and Violet Plums are abundant. A considerable quantity of Jargonelle and Windsor Pears are also in the market. Among Apples, we noticed good specimens of Dutch Codlin and Kerry Pippin; other sorts are also good and plentiful. The best Morello Cherries are selling at about 2s. 6d. per half-sieve, Gooseberries are nearly over, and Currants are becoming very scarce. Filberts are rather on the increase. Of Vegetables, Cauliflowers are good, and sufficient for the demand. Cabbages and Turnips are improving. French Beans are good, and very abundant, and there is also a good supply of Windsor Beans. Onions are plentiful; Peas are becoming less abundant. Carrots are good, and Shallots are sufficient for the demand. Salading and Herbs of every kind are abundant. Cut Flowers are chiefly composed of Ceanothus azureus, Bignonia venusta, Yellow and Perpetual Roses, Sweet Peas, Heaths, Verbenas, Fuchsias, Scarlet Pelargoniums, Gardenias, Picotees, and Carnations.

FRUITS.

Pine Apple, per lb., 4s to 6s
Grapes, Hothouse, p. lb., 2s to 4s
— Spanish, per lb., 1s to 1s 6d
Melons, each, 2s to 4s

VEGETABLES.

Cabbages, per dozen, 6d to 1s 2d
Cauliflowers, per doz., 2s to 5s
Sorrel, per hf.-sieve, 6d to 9d
Artichokes, per doz., 1s to 3s
French Beans, p. hf.-sv., 1s 6d to 3s
Potatoes, New, per cwt., 3s to 5s
New Turnips, per bunch, 2d to 8d
Peas, per bushel sieve, 2s 6d to 5s
Beans, per bush. sieve, 1s 6d to 2s 6d
Red Beet, per doz., 1s to 2s
Carrots, 4d to 6d
Basil, per bunch, 3d to 4d
Horse Radish, per bundle, 2s to 3s
Savory, per bunch, 2d to 3d
Cucumbers, Frame, each, 5d to 9d
— Ridge, doz., 9d to 2s 6d
Vegetable Marrow, per doz., 4d to 1s
Spinach, per sieve, 1s 6d to 2s 6d
Leeks, per bun., 3d
Chilis, per 100, 2s to 4s
Garlic, per lb., 4d to 6d
Onions, per bunch, 2d to 6d
— large, per bushel, 1s to 3s
Shallots, per lb., 4d to 6d
Tomatoes, per punnet, 1s to 1s 6d
Lettuce, per score, 6d to 1s 6d
Celery, per bunch, 1s to 1s 6d
Mushrooms, per pottle, 6d to 1s
Small Salads, per punnet, 2d to 3d
Watercress, p. 12 sm. bun. 3d to 6d
Parsley, per doz. bunches, 1s to 3s
Tarragon, Green, per bunch, 2d to 3d
Green Mint, per bunch, 2d to 3d
Marjoram, per bunch, 2d to 3d
Chervil, per punnet, 2d to 3d

HOPS, Friday, Aug. 16.

Our Market continues very active, and prices advancing. The Duty has fallen to 120,000*l.*

Patternden & Smith, Hop-Factors.

MARK-LANE, Monday, Aug. 12.

The supply of Wheat from the home counties this morning was the smallest received all the year, including a very few samples of new, which were good, but some, apparently, rather coarse—the quantity was too small to form a correct opinion, either of its general quality or value; old brought 1s. to 2s. over the prices of this day se'nnight. Business in Foreign was not extensive, being restricted by the advanced prices, at which it was generally held, and it must be noted 1s. dearer than on Monday last.—Barley and Peas remain unaltered; the former meets rather more inquiry.—Beans are also more in demand.—Oats sell more freely, Irish at 6d. and Foreign 6d. to 1s. above last week.

Friday, Aug. 16.

Having had a great deal of rain from Monday to Wednesday, and during the Market of that day, prices of English Wheat advanced 1s. per qr., and at the close a rise of 2s. upon our quotations was pretty generally obtained on Foreign. Although the wet weather continued here yesterday, the accounts from the country this morning lead us to believe that no material injury has yet been sustained by the Wheat still in the fields; nevertheless, the few sales made at the opening of the Market were about 1s. over the rates of Wednesday, but the day proving fine, very little business was subsequently transacted.—Barley, Beans, and Peas fully maintain their late value, and Oats must be written 6d. to 1s. dearer.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS and Co., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the Ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to James Clark, 24, Billiter-street.

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS and SONS, LONDON;
Wm. J. MYERS and CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, and PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Aug. 15, 1844.

GYPSUM, &c.—Pure Gypsum (Sulphate of Lime) for Compost Heaps, Urine Tanks, Stables, &c.; also Sulphuric Acid, Guano (foreign and Potter's), Rape Cake and Rape Dust, and all other Manures, may be had of the Undersigned.

Synopsis of Prices, and mode of use, on application.

Mark Fothergill, 40, Upper Thames-street.

TO FLORISTS AND ADMIRERS OF FLOWERS.

BRAIN'S CONCENTRATED LIQUID GUANO, for the Garden, Shrubbery, Hothouse, and Conservatory.

This preparation is peculiarly adapted for the development of Flowers, furnishing them with the materials (in a soluble form) out of which they weave their delicate tissues and elaborate their beauteous colouring. It has no unpleasant smell, is easily applied, and thus recommends itself, either for the Garden or Drawing-room.—Price 1s. 9d. per quart Bottle, and may be had of Wm. Jackson, late Geo. Butler, 93, Cheapside, corner of King-street, and most respectable Druggists and Seedsmen, with full directions for use inclosed.—Works, Thomas-st., Stamford-st., Blackfriars-rd.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade. Thos. J. Croggon, 8, Ingram-court, Fenchurch-st., London.

ASPHALTE.—BROWN OIL VARNISH, BLACK VARNISH PAINT.—Asphalte in a pure state, without grit, 5s. per cwt., in casks 2 cwt. each, for forming or improving garden walks, terraces, court yards, stalles, ground-floors, roofs, or for applying to damp walls. Brown Oil Varnish for varnishing gates, outhouses, fences, &c., 8d. per gallon—it dries very quickly. Black Varnish Paint for outhouses, fences, &c., 8d. per gallon.—R. Richardson, Net and Tent maker, 21, Tonbridge-place, corner of Judd-street, New Road, London.—Pitch 5s. per cwt. Stockholm Tar, &c.

DRAINING OF LAND.

THE A LEVEL, designed for the Use of Workmen, in preserving a uniform fall in Drains and Water-courses. In consequence of the approval expressed and the demand made for these Levels at the recent Southampton Show, Mr. Bailey Denton has arranged with an eminent London Mathematical Instrument Maker to make them in any number required. Price 30s.

This Level is as accurate as a spirit-level, and so simple, that the workman unable to read can use it with facility. When closed it forms a 5 feet staff.

Orders addressed to Mr. Denton, Land Agent, 9, Gray's Inn-square, will insure a perfect instrument.

BURBIDGE and HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1l. 8s. Garden-Lights made and glazed from 1s. per foot, at Jas. Watts' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COTTAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, viz., one man and three boys. With this amount of labour, the product of a day of 10 hours is as follows, viz.:—

1 inch diameter of Tile,	11,000	1¾ inches diameter of Tile,	5,800
1¼ " "	8,000	2¼ " "	3,200

The Machine is movable down the drying-sheds, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operation for upwards of four months at Hempstead Park, near Cranbrook, Kent. No charge made for Patent dues or licence. The purchase of the Machine includes free use of it.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1s. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at Metcalfe's Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

LEA and PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with Lea & Perrins's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) James Hosken."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup; giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. Lea and Perrins, Worcester; Messrs. Barclay and Son, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

HORIZONTAL WATCHES, very flat.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank. Price, in silver cases, three and a half guineas each; or in gold cases, six guineas each. These Watches are accurate and durable, the horizontal escapement being peculiarly suited to combine those important requisites. They are jewelled in four holes, and continue going whilst being wound. A twelvemonth's warranty given with each.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Gailey Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5s., 10s., 20s., 50s., and 100s. each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1l. to 5l. per annum; mansions and estates from 10l. and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

BRIGHT'S CUSTARD COMPOUND.—The ORIGINAL VEGETABLE PREPARATION, for making custards without eggs. Patronised by the Royal family, Nobility, and Gentry, with the approval and testimony, amongst many others, of the COOKS to SIX CROWNED HEADS. Sold in boxes at 1s. and 4s. each. Manufactory, 5, Holland-street, North Brixton, Surrey. Wholesale of all respectable houses, and retail by upwards of 1800 chemists, confectioners, grocers, Italian Warehousemen, &c., throughout the United Kingdom. Caution—Beware of imitations, and observe on all sent out the signature of the Inventor, John Bright.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, Lambeth Pottery, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

THE PUBLIC compare the quality of the EAST INDIA TEA COMPANY'S TEAS with their advertised prices and marvel (it would indeed appear marvellous) how Six Pounds of really Good Tea can be sold for 17s. The simple fact is, that the Company treat all alike, and give the private consumer all the advantages of the public dealer.—Offices, No. 9, Great St. Helen's Churchyard, Bishopsgate Street.

KNIGHT'S WEEKLY VOLUME.

This day,

FEATS ON THE FIORD: a Tale of Norway. By Harriet Martineau. A new Edition.
London: Charles Knight & Co., 22, Ludgate-street.

Complete in two Vols., price 4*l.* 4*s.*, cloth,

THE FLOWER-GARDEN OF ORNAMENTAL PERENNIALS, containing coloured Portraits, with Directions for the Cultivation of nearly five Hundred Perennial Herbaceous Plants, or such as die down in the winter, to appear again in the spring—including a large number of showy flowers not generally known, but which will grow freely in any garden. By Mrs. Loudon.
London: Published by William Smith, 113, Fleet-street; of whom may be had, by the same Author,
THE FLOWER-GARDEN OF ORNAMENTAL ANNUALS; cloth, price 2*l.* 2*s.*
THE FLOWER-GARDEN OF ORNAMENTAL BULBOUS PLANTS; cloth, price 2*l.* 12*s.* 6*d.*

WITH THE APPROVAL OF THE LORDS COMMISSIONERS OF HER MAJESTY'S TREASURY.

COMPLETION OF THE ZOOLOGY OF THE BEAGLE.
Just completed, in Five Vols., bound in cloth, or in half Morocco or Russia, at a small addition to the price,

THE ZOOLOGY OF THE VOYAGE OF H.M.S. BEAGLE, under the command of Captain Fitzroy, R.N., during the years 1832 and 1836. Edited and Superintended by Charles Darwin, M.A., F.R.S., V.P.G.S., Naturalist to the Expedition. Comprising highly-finished representations of the most novel and interesting objects in Natural History, collected during the Voyage of the Beagle, with descriptive letter-press, and an account of the habits and ranges.

Contents of the Volumes.—Fossil Mammalia, by Richard Owen, Esq., F.R.S., plain plates, 1*l.* 14*s.*—Mammalia, by R. Waterhouse, Esq., coloured, 2*l.* 2*s.*—Birds, by John Gould, Esq., F.L.S., coloured, 3*l.*—Fish, by the Rev. Leonard Jenyns, M.A., F.R.S., plain plates, 1*l.* 18*s.*—Reptiles, by Thomas Bell, Esq., F.R.S., F.L.S., plain plates, 1*l.* 2*s.*
Each Volume is complete in itself, and may be had separately.

GEOLOGICAL OBSERVATIONS made during the VOYAGE of the BEAGLE, in Three Parts.
By Charles Darwin, M.A., F.R.S., V.P.G.S.
Just Published, in 1 vol. 8vo, price 15*s.* cloth.
Part I.—ON THE STRUCTURE AND DISTRIBUTION OF CORAL REEFS.
Just Published,
Part II.—ON THE VOLCANIC ISLANDS OF THE ATLANTIC AND PACIFIC OCEANS.
(Together with a brief Notice of the Geology of the Cape of Good Hope and of part of Australia.)
Part III.—ON THE GEOLOGY OF SOUTH AMERICA.
London: Smith, Elder & Co., 65, Cornhill.

Just Published, Second Edition, revised, with Introductory Comments upon certain Criticisms that have appeared on the Work, in 2 volumes, post 8vo, with 8 Portraits,

A NEW SPIRIT OF THE AGE. Containing Critical Essays and Biographical Sketches of Literary and other Eminent Characters of the present time.
Edited by H. R. Horne, Esq.
London: Smith, Elder, and Co., 65, Cornhill.

IMPORTANT TO AGRICULTURISTS.
In the Press, the Second Edition,

A PRACTICAL ESSAY, and Instructions for the Use of Guano as a Manure, generally arranged for all Soils and Crops, Horticulture, &c., with a Table of 500 Testimonials and Results from the earliest introduction of Guano into the United Kingdom, including the Reports and Progress of the Royal Agricultural Meeting at Southampton, and the Highland and Agricultural Society of Scotland, down to the present time; with proper Rules for the Application of Guano and Gypsum, to be applied with Sowing and Drilling of Wheat, also for Grass and Meadow Land in the autumn, with Instructions to purchase and secure pure Guano, and to ascertain if genuine or spurious, and a remedy for retaining its full power and strength any length of time out of the soil.

Applications to the Author only can be supplied, and all letters to be post-paid, inclosing 1*s.* 8*d.*; including a Treatise on Gypsum, 2*s.*; and the work will be posted pre-paid.

N.B.—Attested Genuine AFRICAN GUANO, as imported ex ship at Liverpool, 5*l.* 15*s.*, and Spring delivery for 1845, 6*l.* per ton; payment by approved Bills at three months, on delivery.—Direct J. H. Sheppard, Land Surveyor, City of Chester.

Just published, the Thirteenth Edition, price 2*s.* 6*d.*; free by post, 3*s.* 6*d.*,

THE SILENT FRIEND on NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. Perry and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho; Wilson, 338, Oxford-st. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11*s.* and 33*s.* Perry's Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by all Medicine Venders.

Messrs. Perry and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

On the 1st September will be published, No. I., price 2*s.* 6*d.*, of

BRITISH WILD FLOWERS.
By MRS. LOUDON.

With three Coloured Plates in each Number. Demy 4to.

This work will only include those British Plants which are at once common and ornamental, as it is intended principally for the use of ladies taking country walks, who may wish to know the names of Flowers they meet with in the fields and hedgerows, and some particulars respecting them. As the work is to be of quite a popular character, the English names of the plants will be made the most prominent; but, in order to render it as generally useful as possible, especially to young persons, the most striking botanical characteristics of each plant will be explained in such a manner as to be perfectly comprehensible to every reader.

The form of the work will be that of the "Ladies' Flower Garden," and it is intended to comprise the whole in one thick volume of about twenty Numbers.

London: William Smith, 113, Fleet-street.

WORKS PRINTED FOR

TAYLOR AND WALTON,

28, UPPER GOWER-STREET.

CHEMISTRY APPLIED TO THE ARTS.

Now ready, Vol. 2, price 13*s.*, of

PARNELL'S APPLIED CHEMISTRY; in MANUFACTURES, ARTS, and DOMESTIC ECONOMY.

CONTENTS:

Glass, Starch, Tanning, Caoutchouc, Borax and the Boracic Lagoons, Soap, Sulphur and Sulphuric Acid, Soda.

Lately published,

PARNELL'S APPLIED CHEMISTRY, Vol. 1, Price 13*s.*

CONTENTS:

Preliminary Observations, Gas Illumination, Preservation of Wood, Dyeing, and Calico Printing.

THE STEAM-ENGINE, STEAM NAVIGATION, AND RAILWAYS.

One vol. 8vo, with 167 Engravings on Wood, 12*s.*, cloth,

THE STEAM-ENGINE EXPLAINED and ILLUSTRATED. With an Account of its Invention and progressive Improvement, and its Application to Navigation and Railways; including also a Memoir of Watt. By Dr. Lardner. Seventh Edition; with a Portrait of Watt.

CONTENTS:

Preliminary Matter—Engines of Savery and Newcomen—Early Career and Discoveries of James Watt—Exposition of Physical Principles—Further Discoveries of Watt—Watt's Engines—Double-acting Engine—Boilers and Furnaces—Life of Watt.

LOCOMOTIVE ENGINES ON RAILWAYS.

High-pressure Engines—Effects of Railway Transport—History of the Locomotive Engine—Liverpool and Manchester Railway—Experimental Trial—Progressive Improvement of Locomotive Engines—Detailed Description of the most improved Locomotive Engines—Dr. Lardner's Experiments on the Great Western Railway—Methods of surmounting steep inclinations.

LOCOMOTIVE ENGINES ON TURNPIKE ROADS.

Railways and Stone Roads compared—Gurney's Steam Carriage—Two methods of applying Locomotive Engines upon common Roads—Hancock's Steam Carriage.

STEAM NAVIGATION.

Form and Arrangement of Marine Engines—Common Paddle-wheel—Improved Efficiency of Marine Engines—Iron Steam vessels—Steam Navigation to India.

AMERICAN STEAM NAVIGATION.

Steam Navigation first established in America—The Hudson navigated by Steam—Extension and Improvement of River Navigation—American Steamers—Difference between them and European Steamers—Steam Tugs.

CHEMICAL ANALYSIS.

In 1 vol. 8vo, with Diagrams on Wood, price 10*s.* 6*d.* cloth,

ELEMENTS of CHEMICAL ANALYSIS, INORGANIC and ORGANIC. By Edward Andrew Parnell, late Assistant Lecturer on Chemistry in the Medical School of St. Thomas's Hospital.

"We have perused this interesting volume with great satisfaction, and have no hesitation in recommending it strongly as a safe and valuable guide in conducting the intricate and perplexing operations of analytical chemistry."—*Medico-Chir. Review*, Jan. 1843.

LIEBIG'S AGRICULTURAL CHEMISTRY.

Third Edition, with large additions and very numerous alterations, 8vo, 10*s.* 6*d.*

CHEMISTRY in its APPLICATIONS to AGRICULTURE and PHYSIOLOGY. By Justus Liebig, M.D., Ph.D., F.R.S., Professor of Chemistry in the University of Giessen. Edited, from the Manuscript of the Author, by Lyon Playfair, Ph.D.

"—a book infinitely superior to its predecessors, and to a very considerable extent unlike them."—*Gardeners' Chronicle.*

LIEBIG'S ANIMAL CHEMISTRY.

Second Edition, 1 vol. 8vo, price 9*s.* 6*d.*,

ANIMAL CHEMISTRY; or, CHEMISTRY in its APPLICATIONS to PHYSIOLOGY and PATHOLOGY. By Justus Liebig, M.D., Ph.D., Professor of Chemistry in the University of Giessen. Edited, from the Author's Manuscript, by William Gregory, M.D., Professor of Chemistry in the University of Edinburgh.

"While we have given but a very imperfect sketch of this original and profound work, we have endeavoured to convey to the reader some notion of the rich store of interesting matter which it contains. The chemist, the physiologist, the medical man, and the agriculturist, will all find in this volume many new ideas and many useful practical remarks. It is the first specimen of what modern Organic Chemistry is capable of doing for Physiology; and we have no doubt that from its appearance Physiology will date a new era in her advance."—*Quarterly Review*, No. 139.

LIEBIG'S CHEMICAL LETTERS.

Second Edition, fcap. 8vo, 4*s.* 6*d.*

FAMILIAR LETTERS on CHEMISTRY; and its Relations to Commerce, Physiology, and Agriculture. By Justus Liebig, M.D., Professor of Chemistry in the University of Giessen. Edited by John Gardner, M.D., Member of the Chemical Society.

"That the public will discover its merits, and that it will find its way into the drawing-room as well as the library, and be equally prized by the advanced man of science and the student, we venture to say is certain; and it must increase the respect entertained for Chemistry wherever it is read."—*Chem. Gazette.*

MULLER'S PHYSIOLOGY.

2 vols. 8vo, each volume 20*s.*

ELEMENTS of PHYSIOLOGY. By J. Muller, M.D., Professor of Anatomy and Physiology in the University of Berlin. Translated from the German, with Notes, by Wm. Baly, M.D., Graduate in Medicine of the University of Berlin. Illustrated with Steel Plates and very numerous Wood Engravings.

"We *do*, however, recommend it very strongly, and we have no hesitation in saying that it will supersede all other works as a text-book for lectures, and one of reference for students. It steers a middle course between the superficial brevity of many of our modern works, and the pleonastic and metaphysical jargon of Burdach."—*Med.-Chir. Review*, April, 1838.

*** Subscribers are requested immediately to complete their Copies.

MR. HOARE'S NEW WORK ON THE VINE.
This Day is published, 12mo. 5*s.* cloth,

A DESCRIPTIVE ACCOUNT OF A NEW METHOD of PLANTING and MANAGING the ROOTS of GRAPE VINES. By Clement Hoare, Author of "A Treatise on the Cultivation of the Grape Vine on Open Walls."
London: Longman, Brown, Green, and Longmans.

CONTENTS of the NUMBER for SATURDAY last, AUGUST 10, OF

THE ATHENÆUM,

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

NORTH BRITISH INSURANCE COMPANY, Established 1809. His Grace the Duke of Sutherland, K.G., President. Sir Peter Laurie, Alderman, Chairman of the London Board. Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman. John Webster, M.D., F.R.S., 24, Brook-street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on the 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. Born, 4, New Bank Buildings, or of the Actuary, 10, Pall Mall East.

JOHN KING, Actuary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY. 14, WATERLOO PLACE, LONDON.

The Chisholm, *Chairman.* W. Morley, Esq., *Deputy Chairman.*

PECULIAR ADVANTAGES OFFERED TO POLICY-HOLDERS IN THIS INSTITUTION.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l.*, for One Year, Seven Years, and the whole Term of Life.

AGE	ANNUAL PREMIUM.					
	ONE YEAR.		SEVEN YEARS.		WHOLE LIFE.	
	£	s. d.	£	s. d.	£	s. d.

60	3	3 5	3	17 0	6	8 3

Full particulars are detailed in the Prospectus.

A. R. IRVINE, Managing Director.

METROPOLITAN LOAN COMPANY. ESTABLISHED, 1839.

Offices, No. 1, Craven-street, Strand, London. Open from Eleven to Three o'clock daily.

Loans are advanced by the Company on the security of two responsible housekeepers, in sums of 10*l.* 10*s.*, 15*l.*, 20*l.*, 25*l.*, 30*l.*, 35*l.*, 40*l.*, 45*l.*, and 50*l.*, for periods of twenty-five weeks, at 2½ per cent., or of fifty weeks, at 5 per cent., at the option of the borrowers, to be repaid by weekly instalments. If the securities are approved by the directors at their weekly meeting, the loans are immediately advanced. Amounts exceeding 50*l.* are advanced by special agreement with the directors. Forms of application, containing the rules and regulations, may be had at any hour of the day, price 2*d.*

NATIONAL TESTIMONIAL TO Mr. ROWLAND HILL, Author of the Penny Postage, under the Management of the City of London Mercantile Committee on Postage.

Sir GEORGE LARPENT, Bart., Chairman and Treasurer.

The Committee engaged in this undertaking beg to intimate to the several provincial Committees and others, who are co-operating with them, that it is their wish to close the Subscriptions early in the ensuing month of September.

To those who have not yet contributed, the Committee again appeal for their Subscription, in the confident expectation that few would wish the opportunity of rewarding the author of a plan which has conferred such great social, moral, and commercial benefits on the country to pass by without their having taken part in it.

When the Collection is completed, the mode in which the amount raised is to be presented to Mr. HILL will be determined and made known to the public.

Subscriptions may be paid through any of the London Banks, or remitted by post-office orders, stamps, or otherwise, to the Secretary, Mr. GEORGE WANSEY, Solicitor, No. 3, Lothbury, London.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s.* 9*d.* per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

REALLY WATERPROOF.

BERDOE'S SUPERIOR WATERPROOF FROCKS, SHOOTING-JACKETS, GARMENTS for the SEA SIDE, &c.—An extensive variety of the above, in NEW and greatly improved materials always ready, guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid the disappointment and vexation consequent upon purchasing articles made by slopsellers, and sold by parties not Tailors.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BEARDE, Tailor, Waterproofer, &c., 69, Cornhill. (north side).

THE LATE MR. LOUDON.—The following Subscribers to the Works of the late Mr. LOUDON have been obtained since the publication of the List which appeared in the *Gardeners' Chronicle* of June 1st.

ARBORETUM BRITANNICUM, 10*l.*

Thos. W. Giffard, Esq., Chillington, Wolverhampton
W. Borrer, Esq., Henfield, Sussex
Lord Crewe, Bamburgh Castle
The Rev. W. J. Chesshyre, Barton Court, near Canterbury

Rt. Irvine, Esq., Scotsman Office, Edinburgh; the Supplement.

WATERTON'S ESSAYS ON NATURAL HISTORY, 8*s.*

The Rev. Thos. James, Theddingworth, near Welford
Dr. Murray, 2, Armiston-place, Edinburgh.

CEMETERIES AND CHURCHYARDS, 12*s.*

Dr. Murray, 2, Armiston place, Edinburgh.

THE GARDENERS' MAGAZINE, 9 vols., 9*l.* 17*s.*

Mr. J. P. Petersen, Copenhagen; the Vols. for 1838, 1840, 1842, and 1843; the Nos. from January to July inclusive, for 1839; and the Nos. for October, November, and December, for 1841.

Lately Published, small folio, Price 6*s.*,

A CONCISE TREATISE on the AGRICULTURAL GRASSES INDIGENOUS to IRELAND, with DRIED SPECIMENS of each GRASS. By D. MOORE, A.L.S., &c., Curator of the Royal Botanic Garden, Dublin.

"It is not too much to say of this work, that it is one of the most useful things that can be put into the hands of a person interested in rural affairs and unacquainted with botany; its very small price, 6*s.*, places it within the reach of everybody. Young gardeners, too, who are expected to know the common Grasses when they see them, will find it an excellent companion."—*Dr. Lindley in Gardeners' Chronicle for 30th March, 1844.*

"We have much pleasure in noticing this work on our Indigenous Grasses. With respect to the tables, some difference of opinion may exist, which, however, does not detract from the value of the work, the great merit of which, and one that we trust will, as it undoubtedly ought, recommend it to every lover of agricultural improvement—is, that it contains the Grasses in their natural state *correctly named*; we, therefore, welcome this performance as a boon to Agriculturists, and have no doubt it will be viewed as such."—*Irish Farmers' Gazette.*

"The work is one of the neatest and most comprehensive things of the kind which can be conceived, and although it embraces all, we may say, that can be learned theoretically of the Grasses of which it treats, it is free from confusion and simple in the extreme."—*Northern Whig.*

WILLIAM PAMPLIN, 45, Frith-street, Soho, London; CURRY & Co., Sackville-street, Dublin; DRUMMOND'S Agricultural Museum, Dawson-street, Dublin; SCOTT, Brothers, Seed Warehouse, Belfast; and at AUSTIN'S Seed Warehouse, Glasgow.

Second Edition, price 1*s.* 6*d.*,

CHEMISTRY MADE EASY FOR AGRICULTURISTS. By J. TOPHAM, M.A.

"A most valuable little work. As a *vade mecum* to the farmer, we know of no work to be compared with it."

Eddowe's Journal, August 7th, 1844.

WHITTAKER and Co., and all Booksellers.

BOOKS ON SPORTING. 1.

COLONEL HAWKER'S INSTRUCTIONS TO YOUNG SPORTSMEN, in all that relates to GUNS and SHOOTING. Ninth Edition, corrected, enlarged, and improved, with 85 Plates and Woodcuts by Adlard and Branston, from Drawings by C. Varley, Dickes, &c. 8vo. 21*s.*

"The very best book we have on the subject."—*Blackwood.*

"Colonel Hawker expounds the whole *rationale* of shooting with clearness, fulness, and vivacity."—*Edinb. Rev.*

2. AN ENCYCLOPÆDIA OF RURAL SPORTS; comprising HUNTING, RACING, SHOOTING, FISHING, COURSING, &c. &c. By D. P. BLAINE, Esq. One very thick volume, 8vo, illustrated with nearly 600 Engravings on Wood, 50*s.*

"A perfect library for all lovers of country sports, for all country gentlemen, and for all persons who delight in the manly and healthy recreations which are afforded to the inhabitants of no country in such perfection as to the inhabitants of the British Isles."—*Times.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

News of the Week.

BY extraordinary express from Paris, intelligence reached town yesterday of the bombardment of Tangiers by the French squadron commanded by the Prince de Joinville. Telegraphic despatches had been received in Paris in the beginning of the week announcing the suspension of hostilities and the appointment of the Pacha of Larache on the part of the Emperor with full powers to treat for peace. No doubt was entertained of the good faith of the Emperor, or of his desire to effect an amicable settlement of all differences; but the French Ministerial Papers were by no means sanguine of the result, and they referred ominously to the authority of letters from Gibraltar, and to the journals of Cadiz and Madrid, which described the exasperation of the Moors to be so great as to suggest fears that the Emperor would not be able to persevere in a pacific course. These forebodings have proved but too well founded, and the *Débats* of Thursday announces that the Government on Wednesday night received the following important despatch from the coast of Africa:—"The reply to the *ultimatum* sent to the Emperor of Morocco by the Prince Admiral commanding the French fleet was not appeared satisfactory. His Royal Highness the Prince de Joinville ordered the bombardment of the advanced works which defend Tangier. Those works have been destroyed. The European quarter of the town has been spared. Mr. Drummond Hay, the Consul-General of England, took refuge on board the French Admiral's ship." It will be observed that the date of the bombardment is not given, but it would seem to have occurred many days ago, as the Madrid papers of the 8th inst. mention the receipt of a letter from the coast stating that the firing was seen from the watch-tower of Cadiz, and that a steamer had left that harbour with passengers to view the sight. This statement was at first supposed to be untrue, but there can now be no doubt that the bombardment has taken place, and further advices may be looked for with some interest.—The affairs of Tahiti are still the subject of angry comment, but it is evident, from the tone of the Ministerial papers, that the possibility that the French authorities had been in the wrong is beginning to be admitted. The Opposition journals are still clamourous for war in preference to any concession to this country, but a general impression prevails in the best-informed circles, that the affair will terminate amicably. During the past week two other events have occurred, which, under other circumstances, would have excited speculation; one of these is the sudden equipment of a squadron for Tunis, for the alleged purpose of preventing the landing of troops from the Turkish fleet, which is supposed to be directing its course to that quarter; the other is the establishment of the French protectorate over the Gambier Islands, where the tri-coloured flag was flying on the 25th February. In addition to these occurrences, the visit of Count Nesselrode to London is regarded with some uneasiness by the French journals, which connect his visit with some unknown object of a political character. A rumour of M. Guizot's retirement, from an unwillingness to yield to the demands of England or incur the alternative of a war, is also current, and although not generally credited, these various reports have given rise to much uneasiness in Paris, and the funds have fallen considerably, from a prevailing belief that the present state of affairs presents a sombre prospect for the future.—From Spain there is nothing of much interest beyond the arrangements for the return of the two Queens to Madrid, and the continuance of arrests, in connexion with the plots which the Government profess to have discovered.—From Italy we learn that there is no longer any doubt of the issue of the late insurrection in Calabria. Of the 19 prisoners captured by the Neapolitan troops, 17 have suffered death, among whom were the two sons of Admiral Bandiera, who, as the commander of the Austrian navy, took part in Sir R. Stopford's expedition on the coast of Syria in 1840. Most of the prisoners executed were of noble families in Venice or the Papal States, and their execution has made so deep an impression at Naples, that the Government has found it necessary to adopt extraordinary precautions to prevent another outbreak.—The event of the week which is at once the most startling and unexpected, is the intelligence from Alexandria that Mehemet Ali has suddenly abdicated, and announced his intention to retire to Mecca. Although this determination is no longer likely to have much influence on European policy, it is still the most remarkable instance of a voluntary renunciation of political greatness which the world has seen since the retirement of Charles V. to the monastery of St. Just. The succession to the Pachalic of Egypt is secured to his son Ibrahim by the events of 1840, and it is supposed that Mehemet Ali, by his retirement to the City of the Prophet, is not only anxious to prepare for his final pilgrimage, but also to witness, before his death, the commencement of the career of his own posterity in the sovereignty which he created.

At home, with the exception of Her Majesty's convalescence, there is little which calls for particular observation, except the official notice served upon the attorneys for Mr. O'Connell and the other appellants to the House of Lords, stating that their cause will be taken into further consideration on Monday, the 2d of September, and that the Judges will then attend the House and deliver their opinions upon the questions of law submitted to them.

Home News.

COURT.—The following gratifying bulletin was issued on Wednesday morning:—"Windsor Castle, August 14, 1844. The Queen is convalescent. The infant Prince continues well. (Signed) James Clark, M.D., Charles Locock, M.D., Robert Ferguson, M.D. Her Majesty's recovery is so far advanced that no more bulletins will be issued." In consequence of this decision, the Queen's First Physician-Accoucheur, Dr. Locock, and Dr. Fer-

guson, left their apartments in the Lancaster Tower on Wednesday for town. Sir James Clark, Her Majesty's First Physician in Ordinary, will be in occasional attendance for some time longer. The Queen, we rejoice to state, is now going on so favourably as to be able to sit up two or three hours during the day. Prince Albert, the Prince of Wales, and the Princesses, are quite well, and have taken their usual airings during the week. On Sunday, Count Nesselrode, accompanied by his son, arrived at the Castle from town, and had an audience of His Royal Highness. On Wednesday, H. R. H. the Prince of Prussia paid a visit to the Prince, and partook of a *dejeûner* previous to his departure for Bushy Park. On Thursday Prince Albert came to town by a special train of the Great Western Railway, and visited the Prince of Prussia at the residence of Chev. Bunsen. H. R. H. then inspected the new summer temple in the gardens of Buckingham Palace, and afterwards returned to Windsor Castle. Tuesday, being the birthday of the Queen Dowager, the different members of the Royal family paid visits of congratulation to Her Majesty, and several of the public buildings in London were illuminated in the evening.

Arrival of the Crown Prince of Prussia.—His Royal Highness Prince William, the brother of the King of Prussia, and heir-apparent to the throne, arrived at Woolwich on Tuesday evening from Ostend, and was received with the usual honours by the authorities of the Dockyard. The Prince immediately proceeded to town, and took up his residence at the mansion of Chevalier Bunsen, the Prussian Minister, in Carlton Terrace. On Wednesday his Royal Highness proceeded to Windsor Castle on a visit to Prince Albert, and afterwards visited the Queen Dowager at Bushy Park, and the Duke and Duchess of Cambridge at Kew. On Thursday the Prince visited the Duke of Wellington at Apsley House, and afterwards inspected Westminster Abbey, the collection of frescoes in Westminster Hall, and the establishment of Messrs. Mortimer and Hunt in Bond-street. H. R. H. afterwards drove through Regent-street and round the Regent's Park. In consequence of the Prince having appointed to go to the Italian Opera House, the circle at dinner was limited, Prince Edward of Saxe Weimar, the Earl and Countess of Westmoreland, and Lady Hall being the only personages present exclusive of the noblemen in the retinue of the Prince, and the gentlemen connected with the Prussian Legation. After dinner the whole party left for Her Majesty's Theatre. Last evening a grand entertainment was given at the embassy, at which the Duke and Duchess of Cambridge, Duchess of Gloucester, the Hereditary Grand Duke and Duchess of Mecklenburgh Strelitz, and the Duke of Wellington were present to meet the Prince. This morning, his Royal Highness, attended by the Prussian Minister and his suite, will visit Woolwich, and in the evening the Prince will dine with the Duke of Wellington. It is rumoured that H.R.H. will pay a visit to Portsmouth on Monday next, in company with the Duke of Wellington, and that on the 20th his Royal Highness will leave town to make a tour in the provinces, during which he will pay visits to several of the nobility. The Prince's tour will, however, be of short duration, as his Royal Highness is compelled to be in town again on the 28th, in order to pay a visit to Her Majesty prior to his departure for the Continent, which cannot be delayed beyond the 1st or 2d of next month, the Prince having to attend a grand review on the 5th in Prussia. The Duke of Wellington as Commander-in-Chief has made arrangements for a review upon a large scale during his Royal Highness's stay in this country.

Count Nesselrode.—On Thursday Count Nesselrode visited the new Houses of Parliament and Buckingham Palace. In the afternoon he left town for Rosebank, to attend the Marquis of Londonderry's *fête*, and afterwards went to the Opera. On Friday he visited the Thames Tunnel and the Bank of England, and dined with Lord Aberdeen. On Saturday the Count honoured Mrs. Lawrence with a visit at her residence, Ealing-park. His Excellency is a great admirer of floriculture, and the inspection of the extraordinary collection of rare flowers and plants contained in this lady's conservatory afforded him the highest gratification. Upon taking leave, the Count proceeded to the Star and Garter at Richmond, for the purpose of enjoying the beautiful scenery of that locality. He returned to the Embassy to dine, and went to the Opera in the evening. On Sunday the Count paid a visit to Prince Albert at Windsor Castle, and afterwards inspected St. George's Chapel. On Monday His Excellency paid a series of visits to the nobility, including Lord Melbourne, the Earl of Westmoreland, and Lord Stuart de Rothsay. The Count subsequently called at the Foreign-office, where he was joined by the Earl of Westmoreland and Lord Aberdeen, with whom he had an interview of some duration. Count Nesselrode returned to an early dinner at the Embassy, and left shortly after 6 o'clock, with his son and Baron Brunow, by railway, for Brighton, where he took up his quarters at the York Hotel. His Excellency visited the Spa at an early hour on Tuesday and Wednesday mornings, and drank the waters; and on Wednesday proceeded to town by rail-way to meet his son-in-law and daughter, the Baron and Baroness Seebach, who arrived in town on Monday, and accompanied the Count on his return to Brighton yesterday. If the air of Brighton should agree with him, it is probable that Count Nesselrode may remain for a month or six weeks.

Army and Navy.—The Ministerial papers mention that, during last week, the principals of the different departments of the Horse Guards, Admiralty, and Ordnance had repeated communications with Sir R. Peel. There is reason to believe, from the confident rumours in circulation, that there will be an extended promotion in the Army and Navy this autumn.

Duchies of Cornwall and Lancaster.—An account of the gross and net revenue of the Duchy of Cornwall for 1843, and of the Duchy of Lancaster for the year ending Michaelmas 1843, was laid before Parliament shortly before the adjournment, by command of Her Majesty. It has since been printed and published. The gross total income of the Duchy of Cornwall for 1843 amounted to 40,100*l.* 18*s.* 11*d.* Of this sum, 14,069*l.* was derived from rents and arrears of rents received up to the 31st December, 3882*l.* from fines on new grants of leases, 15,741*l.* from compensation in lieu of the tin coinage duties, 2690*l.* from the produce of Royalties of the coal mines in Somerset, and 2842*l.* from Royalties and reservation of dues of mines in Cornwall and Devon. 18,579*l.* constitutes the total amount of payments made out of the above revenue to the use of his Royal Highness; the balance due to the receiver-general on the 31st Dec., 1842 (including arrears) amounted to 2585*l.*; the outstanding arrears due to his Royal Highness on the 31st Dec., 1843, amounted to 1904*l.*; and the balance in the hands of the receiver-general to 3996*l.* The general expenses amounted altogether to about 13,020*l.* From the accounts of the Duchy of Lancaster, it appears that the gross total income for the year ending Michaelmas, 1843, amounted to 33,037*l.* 18*s.*, including the balances remaining on account of the receiver-general at the expiration of the preceding year. 13,000*l.* constitutes the total amount of payments made out of this revenue to Her Majesty's keeper of the privy purse, and a balance of 4941*l.* remained on the account of the receiver-general to Michaelmas, 1843. The general expenses were about 15,030*l.*

Poor Law Returns.—A Parliamentary return has just been printed, showing the number of orphan and deserted children under 14 years of age, at present in the Poor Law Union workhouses of England and Wales, and of the number of widows receiving out-door relief, with the number of children under 14 years dependent on them for subsistence. By the summary it appears that there are 508 unions in England, and with the unions in Wales and others under local Acts, &c., the total was 580. The total number of children in England and Wales, having lost one or both parents, under 14 years of age, in March last, in union workhouses, numbered 18,261, of which number 8846 are boys, and 6959 girls. The number of children under 14 deserted by their parents at the same period, was 7152, making 25,413 children in union workhouses in March last in England and Wales, under 14. It further appears that in March last there were in England and Wales, 85,295 widows receiving out-door relief, and the number of children depending on them, 119,310. In England alone there are 15,805 orphan children in union workhouses, and 6108 in the same places, deserted by their parents; there are 71,250 widows receiving out-door relief, who have 102,913 children depending on them for subsistence. From another return, moved for by Mr. Hindley, of all children removed from union houses into the army and into the Navy, &c., it appears that, in England, the total number of children removed into the Army amounts to 132, and the total number removed into the Navy to 139; making altogether 271. Of these children, 137 were from 10 to 15, and 134 from 15 to 20 years of age.

Imprisonment for Debt.—The Act for abolishing imprisonment for debts under 20*l.* except in cases of fraud, being now the law of the land, it may be interesting to notice a Parliamentary return published prior to the adjournment, on the motion of Mr. Hume, showing the number of persons whose debts, without costs, were under the sums of 1*l.*, 5*l*, 10*l.*, 50*l.*, 100*l.*, 500*l.*, and above the last-mentioned amount,—stating, also, the average term of imprisonment of each of these classes of debtors, the name, amount of debt, and the amount of each person's expenses who had been imprisoned more than five years. These returns cover a space of no less than 56 pages. It appears from them that the total number of persons who at the beginning of this year were imprisoned for debt in the United Kingdom amounted to 3352, of whom 2154 were confined in England and Wales, 85 only in Scotland, and 1113 in Ireland. The total number imprisoned for debts (exclusive of costs) under 1*l.* amounted to 210; under 5*l.*, to 794; under 10*l.*, to 483; under 50*l.*, to 922; under 100*l.*, to 249; under 500*l.*, to 298; above 500*l.*, to 104, and 36 for amounts not stated. As many as 256 persons were imprisoned for offences against the revenue laws, and 85 prisoners had been confined more than five years—viz., 78 in England and 7 in Ireland. Nearly one-half of the prisoners, or 1469, were (exclusive of costs) confined for debts under 10*l.*, and one prisoner is mentioned as having been imprisoned within the Queen's Prison for 32 years, at an annual expense to the county of 9*l.* 2*s.* 6*d.*

The Game Laws.—A Parliamentary return of all inquests held by the coroners of England and Wales since the year 1833 upon the bodies of gamekeepers, and the number of persons convicted of offences against the game-laws during the year 1843, &c., has been printed by order of the House of Commons—having been moved for Mr. Mainwaring and Mr. Bright. The summary of the latter branch of the return states that the total number of culprits convicted of such offences in the various counties of England during the year 1843 amounted to 4402, of whom 144 were convicted at the assizes, and 4258 at petty and quarter-sessions. In Wales 127 were convicted—namely, 8 at the assizes, and 119 at quarter and petty-sessions. It follows therefore that the total number of convictions in England and Wales, during the past year, amounted to 4529, of whom as many as 4377 were convicted at courts of quarter and petty-sessions.

Foreign.

France.—Telegraphic despatches reached Paris on Monday from Tangiers and Gibraltar, announcing the suspension of hostilities between France and Morocco. They stated that at the moment when the Prince de Joinville was about to commence the bombardment of Tangiers, a letter from the Emperor was received, giving full power to the Pacha of Larache to treat for peace. The Emperor, besides, was to write a letter to the Prince de Joinville, in which he assured his Royal Highness that peace would be re-established. Mr. Hay, the British Consul, was mainly instrumental in effecting this arrangement, and it was said that he would accompany the Emperor on his way to Alkazar, which is within a day and a half's journey from Tangiers. It was even rumoured in Paris on Saturday that an embassy was to be sent forthwith to Morocco, and the Duke of Glucksberg, who is at present Secretary of the Embassy at Madrid, was mentioned as the probable Minister. Although this news was on the whole satisfactory, the Paris journals did not found upon it any very sanguine anticipations of peace. They doubted not the desire of Muley Abderrachman to remain on good terms with France, or even his earnest wish to be, by the aid of the French army, relieved from the dangerous presence of Abd-el-Kader. But they were apprehensive that the indomitable Emir would not be expelled the Morocco territory without a struggle, and that the exasperation of the Moors would not allow the Emperor to pursue his pacific intentions. These opinions have, unfortunately, been confirmed by a telegraphic despatch which reached Paris on Wednesday night, announcing that the reply to the *ultimatum* of the Prince de Joinville was not considered satisfactory, and that H.R.H. gave orders to bombard the advanced works which defended Tangiers. All these works were accordingly destroyed, but the European quarter was spared, Mr. Hay, our Consul, having previously taken refuge on board the Prince's ship. This news reached London yesterday, and the next advices are looked for with great anxiety.—Another expedition of the French navy has been organised with secrecy and despatch, the destination of which was supposed to be Tangiers. It appears however from the Paris *Globe* that the squadron is destined for Tunis, to which place the Turkish squadron, which left the Dardanelles a month ago, is supposed to be directing its course. From this it would appear that the orders given to the French Admiral are to fire upon the Turkish fleet, should the Capitan-Pacha attempt to land any of his troops at Tunis.—The Paris papers of Sunday are principally occupied with the conversation that arose in our House of Commons on Wednesday-week, on the foreign policy of this country, between Lord Palmerston and Sir R. Peel. These journals persisting in the belief that Mr. Pritchard had been guilty of endeavouring to create a revolt in Tahiti against the French, are indignant at the language used in the British Parliament in characterising the conduct of M. d'Aubigny; but it is evident, from certain expressions of the *Débats*, that the possibility that M. d'Aubigny had been in the wrong began to be admitted. That the affair would terminate amicably, was the belief in all well-informed quarters; although various rumours were afloat, which, whether true or not, had the effect of greatly depressing the funds. Morocco, Tahiti, the visit of Count Nesselrode to London, were each in their turn spoken of as offering sombre prospects for the future, and a change of the French Ministry was also spoken of as not an improbable event. These rumours, though not generally believed, had the effect of creating a considerable degree of uneasiness.—A letter from the Gambier Islands, published in the French papers, states that the chiefs of that group have placed themselves under the protection of France, and that the tricoloured flag was floating upon them on the 25th Feb.—The Duc de Nemours is at present on a tour of inspection of the army in the provinces. He has received addresses from the authorities of Besançon, and almost every other town he has passed through. The addresses are all very loyal, but have not taken a political turn, as they did last year.—The journals announce that three telegraphs are now constructing in Paris, which are to be erected on as many vessels stationed in the Channel between Dover and Calais, during the stay of King Louis-Philippe in England. By that means the London telegraph will be placed in direct communication with that of the Ministry of the Interior at Paris, for the transmission of news.—A paragraph, which has been running the round of the journals for some days past, stating that the eldest sister of the Duc de Bordeaux had contracted a Morganatic marriage with one of the sons of the Duc de Blacas, has been contradicted in the most positive manner by the Legitimist journal.—On Wednesday morning, the birth-day of the Prince, the Princess de Joinville was safely delivered of a daughter.—M. de Lamartine embarked at Marseilles on the 7th for Naples, whence he proceeds to the baths of Ischia.

Spain.—Accounts from Madrid of the 8th announce the return of the Ministers of Finance and Justice from Barcelona. Eleven officers of the regiment of the Princess had been dismissed. Several additional arrests had taken place during the preceding night, but the tranquillity of the capital had not been for an instant disturbed. The bank of San Fernando had agreed to advance 50,000,000 to the Treasury, for the wants of the Government during the month of August. The Supreme

Tribunal of Justice has decided that the Civil Court of Arragon was fully competent to try the Carlist officers at Caspe, and that the military were consequently in the wrong. The Barcelona papers mentioned, a few days ago, the arrival at Barcelona of a personage of the "most exalted rank," whom the courtiers had waited on, and whose countenance was "very agreeable." This illustrious visitor, who was suspected to be the Count de Trapani, or some other royal pretender to the Queen's hand, was nothing more than M. Munoz, husband of Queen Christina, the lately-created Duke de Rianzares. The celebrated Father Gonzales, confessor to the Queen Mother, whose dismissal from his post had been announced, arrived also at Barcelona, at about the same time as the Duke, and the circumstance had excited some sensation at Madrid. The programme of the Queen's voyage on her return, has been published in the journals. The court is to leave for Valencia, by steamer, on the 12th, remaining there some days, and returning to Madrid by the 22d. General Narvaez and M. de Bresson come with the Court. Mr. Bulwer returns *viâ* Cadiz. The health of the young Queen is by no means re-established, and it is said that her appearance is that of a person in a confirmed dropsy.—The general junta of the Basque Provinces, in its sitting of the 2d, unanimously claimed the full and entire re-establishment of the Fueros. It decided that a committee composed of seven members out of every district, making forty-two in all, shall be charged to examine the question and give its advice to the junta. In general, these committees only consist of from six to twelve members; but the gravity of this question appears to have rendered a larger committee necessary.—The Madrid journals, in confirmation of the last advices received from Tangiers by the French telegraph, mention several alarming rumours relative to the quarrel with Morocco, and the *Castellano* quotes a letter from Puerto Santa Maria, according to which the "French were bombarding Tangiers, the cannonading was to be heard from Cadiz, the fire to be seen from the watch-tower, and a steamer had left Cadiz with passengers anxious to behold so fine a sight."

PORTUGAL.—We have accounts from Lisbon to the 5th inst. They represent the commerce and agriculture of the country as in a state of great depression, the foreign trade gradually falling off, and its internal resources labouring under difficulties of a recent origin. The agent of Don Miguel in Lisbon has been sending missives and royal mandates throughout Portugal, which have one good tendency, to expose Don Miguel's pretensions to general contempt. The present Nuncio in Portugal is about to be removed, and to be replaced by the late Nuncio at the Court of Naples.—From Madeira we learn that Mr. Jay, the agent of the Court of Bankruptcy in London, had arrived in that island with a warrant from Mr. Commissioner Goulburn for the apprehension of Robert Banister, a bankrupt, who had absconded from his creditors with a large amount of property in his possession. Mr. Jay, in addition to this legal authority, was armed with such official means as the authorities and Foreign Secretary of this country could supply. He arrived in Madeira on the 24th July, and after experiencing much difficulty and opposition from the local authorities, has succeeded in bringing the bankrupt back to London. The property in specie and Bank notes recovered by this procedure, and which is now in the hands of the official assignee, amounts to nearly 3000*l*.

GERMANY.—The official paper of the Prussian Government contains the following letter from the King, dated Erdmansdorff, Aug. 5:—"I cannot leave the soil of my fatherland, if only for a short time, without publicly pronouncing in my own and the Queen's name the deep-felt gratitude by which our hearts are moved. It has been created by the innumerable proofs of affection, verbal and in writing, which the attempt of the 26th July has called forth—affection which, even at the very moment of the crime, hailed us, when the hand of the All-powerful had thrown the fatal missile from my breast to the ground. Looking up to the Divine Saviour, I go with fresh courage to my daily work, to complete what has been commenced, to execute what has been prepared, to combat evil with new certitude of victory, and to be such to my people as my high destiny commands me, and as the affection of my people deserves."—Accounts from Erdmansdorff say, that their Majesties were perfectly well, and intended to set out on the 6th, for Ischl. The Queen will remain there for some time, but the King, after stopping only one day, intends to go to Vienna, and to be back at Erdmansdorff on the 17th of this month. With respect to the proceedings in the affair of Tscheck, we learn that the prisoner having freely confessed the fact, and it appearing that he had no accomplice, the investigation is closed; but that, according to the course of legal forms, it may be a considerable time before the sentence will be published. The Minister of Justice has given directions to appoint a trustworthy guardian for the prisoner's daughter, who has been set at liberty.—Sir G. Hamilton, Chargé d'Affaires in the absence of the Earl of Westmoreland, is negotiating with Baron Bulow, for a treaty to prevent the printing of piratical editions of English books in Prussia, and *vice versâ*. It appears that if this treaty should be actually concluded, England will propose the same measure to the other States of the Customs Union.—The Hanoverian papers state that the important intelligence is in circulation, that Brunswick means to withdraw from the Prussian Customs Union at New Year's day, 1845.—Letters from Prague of the 28th ult. mention that the spirit of disorder was extending to the workmen of the manufactories in which no machines were used, and whose owners were Christians.—The King of Saxony landed at Hamburgh on the 7th, where His Majesty was received with due honour by the authorities; and great preparations are making at Leipzig and Dresden, to give him a cordial welcome on his return to his own dominions.

ITALY.—All doubts are now removed as to the issue of the late attempt to kindle an insurrection in the Neapolitan dominions. Of the band of refugees who left Corfu and landed on the coast of Calabria in June last, 19 have been captured, and 17 of them sentenced to death. Nine were executed on the 25th ult. Among these unfortunate men were the two sons of Admiral Bandiera, who, in 1840, commanded the Austrian squadron in the Levant. The official *Journal of the Two Sicilies* has the following paragraph on the subject:—"The second judgment of the Military Junta, sitting at Cosenza, was delivered on the morning of the 24th July. The sentence includes the individuals composing the band of foreign refugees who landed in Calabria on the 16th June last. Seventeen have been condemned to death. The King has ordered the penalty to be executed as regards the leaders and those who had most excited the rebellion. Nine were in consequence executed on the 25th. Their names are Don Attilio Bandiera, Don Emilio Bandiera, Don Nicola Riciotti, Don Anacarsi Nardi, Don Domenico Moro, Giovanni Veperucci, Giacomo Rocca, Francesco Berti, and Domenico Laputelli." The two Bandieras and Moro were all three officers in the Austro-Italian navy, and of noble Venetian families. Nardi was an Advocate of Modena, and the nephew of the President of the Revolutionary Government transiently established there in 1831. The other five were natives of the Roman States. These executions are stated to have made so deep an impression at Naples that the Government had deemed it necessary to adopt extraordinary precautions.—The health of the ex-King of Holland, now the eldest surviving branch of the Bonaparte family, has, it is said, suffered severely from the death of his brother Joseph.

MALTA.—Accounts from Malta state that great excitement has been caused there between the Catholics and Protestants in consequence of the Bishop of Gibraltar having united in matrimony in his own church, the Rev. Mr. Camilleri, a converted Roman Catholic priest, and a Roman Catholic widow, who had two children by her first husband, whose relations claimed and obtained, by legal process, the right of educating the children. But her newly-converted husband opposed himself with violence and arms to the surrender of the children, who were required to be delivered over to their paternal grandmother by a sentence of the Civil Court. For this contempt of court he was sent to prison for 20 days. The Bishop of Gibraltar, however, it is represented, interceded with the Governor of Malta, and obtained the immediate liberation of the offender, upon payment of a small fine. The Catholic papers contend that Mr. Camilleri ought to have been tried by the Criminal Court, as his crime was one of resistance against public authority, and that his liberation will have a bad effect as a public example; and that in fact the attribute of the pardon of criminal offences has been abused in this instance by the power that held it. Protestant papers reply that Mr. Camilleri is persecuted in consequence of his secession from the Church of Rome; and maintain that the Civil Courts of Malta had no right to annul the marriage, and remove the children from the mother's care: that in doing so the Court followed the practice of the French Courts, where the dominant religion is Roman Catholic; and that such laws are not applicable to British subjects, whose dominant religion is Protestant.

RUSSIA AND POLAND.—Advices from St. Petersburgh reached the Russian Embassy on Thursday, announcing the death of the Grand Duchess Alexandra, fourth daughter of the Emperor, and consort of Prince Frederick of Hesse, eldest son of the Landgrave William of Hesse. The imperial family were prepared for the sad termination of the Grand Duchess's illness, which, it is well known, was the principal cause of the Emperor's hasty departure from this country. The young princess, so prematurely cut off, was born 24th June, 1825, and was married last September to the Prince of Hesse. The courts of the Hague, Saxe Weimar, Wurtemberg, and Hesse are placed in mourning by the death of the Grand Duchess.—Accounts from Warsaw, of July 31, state that a frightful inundation, such as had not been experienced since 1830, has desolated that capital. The Vistula was 18 feet above its level, and the part of the city adjacent to the river was under water, while the faubourg of Praga and an inhabited island of the Vistula were so far covered that only the roofs of the houses and the tops of the trees were visible, all the environs had equally suffered, so that, as far as the eye could reach, nothing was to be seen but an immense body of water. The inundation extended upwards to Cracow, and downwards to Dantzic, and was for the moment sufficient to cut off all the resources of the country people. Houses, crops, cattle, all were buried in the floods. Many of the houses were undermined and destroyed, and the people were suffering from want of food, as all the bakers' and other shops were under water. The account from Kulm says that the Vistula had risen to a greater height than at any time during the last hundred years. It is impossible to say how many thousand villages may be inundated by this mighty river in its long course from Cracow to Dantzic. Above and below Kulm 100 towns and villages are as in a sea, and the inhabitants have been forced to take refuge on roofs, trees, or the neighbouring hills.—A letter has been received from Teflis, which gives an account of the taking of Derbend, on the Caspian, by the Circassians. The garrison, composed of 4000 Russians, were put to the sword. "The Iron Gates" are also said to be in the hands of the Circassians, who thus cut off the communication between Russia and Georgia. The advanced guard of a Russian army of 14,000 men, which had marched from Stavropol, was cut to pieces. An engagement is also said to have taken place in the neighbourhood of Piaty-gorsk, in which the Russians lost a large number of troops. M. de Titoff, the Russian Minister, has addressed a strong note to the Porte, in which he complains that the Turkish authorities upon the frontier do not prevent the passage of munitions of war into Circassia.

EGYPT.—A telegraphic despatch reached Paris on Tuesday, conveying the startling intelligence of the abdication of Mehemet Ali. The despatch is dated Alexandria, July 27. It states that His Highness the Viceroy has just suddenly left Alexandria, declaring that he renounces for ever Egypt and public affairs, and that he retires to Mecca. Ibrahim is at Alexandria. The city is quiet. The abdication or the death of Mehemet Ali is no longer an event of great European importance. The occurrences of 1840 and 1841 having secured the succession to the Egyptian pachalic in the family of Mehemet Ali, we are saved from the difficulties which would have arisen had the right to appoint remained with the Porte, while the resources of the country were in the hands of such a chief as Ibrahim. The abdication, however, is not without interest for Europe. It is not simply the withdrawal from active life of one of the most remarkable men of the present age. The announcement that the Pacha intended "to retire to Mecca" looks as if he had thoughts of preparing for his final pilgrimage. But the most recent accounts state that his health and intellect are still unimpaired, and it is well known that although Mehemet Ali had a high respect for the Holy Cities, as a source of tribute, and as affording by their possession unbounded influence over the faithful, yet by his opinions, conduct, and associations, the Pacha had often given great offence to all true believers. The Marseilles papers, of the 8th, announce the arrival, on the preceding day, of the steamer Redschid, having on board the two Egyptian Princes, Hussein Bey, son of Mehemet Ali, and Ahmet Bey, his grandson. Thirty-six young men, belonging to the first families of Egypt, sent to France at the expense of the Viceroy to receive a European education, accompanied the young Princes. Stephan Effendi, who also came a passenger in the Redschid, was intrusted with their charge. The Princes landed, in the course of the day, at the Lazaretto, where apartments had been fitted out for them, and where they were treated with all the honours due to their rank.

UNITED STATES AND WEST INDIES.—The Hibernia steam-ship arrived at Liverpool on Tuesday, after a passage of little more than 9½ days from Halifax, which she left on the 3d inst. The excitement produced by the Philadelphia riots had ceased, and, according to the papers, there are gratifying indications that the lessons so impressively enforced by these melancholy outbreaks have not been disregarded. The legal investigations and consequent arrest of the ringleaders of the mob, had produced a salutary effect, and there was a perceptible improvement in the tone and conduct of the organs of the native American party. Nearly all the military had left the city. The *Boston Times* publishes an official statement from the President of the branch of the Mormonites in that city, from which it appears that Samuel H. Smith, the oldest member of the family now living, and a brother of the murdered prophet, will take the office of his brother Hiram, as patriarch in the church, "according to the ancient custom of God's people." Governor Ford, of Illinois, has made a requisition on the United States Government for 500 troops, to be stationed in the neighbourhood of Nauvoo, to prevent any bloodshed by the Anti-Mormons or the Mormons. A great deal of exasperated feeling existed in that neighbourhood.—The piratical crew of the ship Saladin, recently arrested at Halifax, were put on trial in that city on the 18th ult. Four of them, Anderson, Travasgurs *alias* Johnson, George Jones, and William Hazelton, were first tried on the charge of piracy. One of them pleaded "Guilty." The Jury brought in, after 15 minutes' consultation, a verdict of "Guilty." On the next day the prisoners all pleaded "Guilty" to the charge of the murder of Capt. M'Kenzie. Carr and Galloway were then tried for the murder of Capt. Fielding. The Court charged the Jury that the crimes of Fielding, who must have been the inducer to the original piracy, were no palliation of the guilt of his murderers. The Jury, however, brought in a verdict of not guilty. A similar verdict was returned after the trial of the same men for the murder of Fielding's son. Sentence of death was delivered on the 20th ult., and the criminals were executed on the 24th, Jones and Hazelton having previously made a full confession of their guilt.—The inundations caused by the overflow of the Mississippi and its tributaries, of which vague accounts have previously been received, are stated to have done great damage to property, and the destruction of cotton cannot fail to have been large. No correct estimate has, however, appeared. Twenty-six houses have been burnt down at Brooklyn, and considerable property destroyed.—News of the rejection of the Annexation Treaty was received at Vera Cruz on the 10th ult. It was immediately forwarded by express to Mexico. The news gave great joy at Vera Cruz, and a revival of American business was expected from it. The fact of the Mexican Congress having granted Santa Anna 30,000 men and 4,000,000 dols. for the invasion of Texas, is confirmed.—Mr. Macready was playing on the 22d ult. at Montreal. The Governor-General ho-

noured his benefit with his presence, and his reception in the character of Macbeth was most enthusiastic. The Canadian papers are full of elaborate critiques upon this performance, as well as that of the characters of Richelieu, Werner, and Hamlet. Mr. Macready's success appears to have been complete.—Accounts had reached New York, stating that the mail steamer Tay, while on her way from Kingston to Havannah, with the mails from England, on 2d June, went ashore on a dangerous reef of rocks on the Havannah side of Cape Antonio, called the Coloradoes. The mail agent, immediately after the accident, started in an open boat, and delivered the bags on the 15th July at Havannah. A Spanish Government steamer, and the Mail schooner Lee, then went to her assistance. The steamer succeeded in getting her off, and she entered the harbour of Havannah on the 17th July, making 3 feet of water per hour. All the quicksilver, anchors, cables, and heavy stuff on board, with the exception of about 20 tons of coal, had previously been thrown overboard.—The intelligence of the loss of H.M.'s steam frigate Gorgon, with eight other vessels, brought over a few weeks since by the mail packet from South America, has been confirmed by dispatches subsequently received at the Admiralty. It occurred on the night of the 11th May last, during a terrific storm, off the coast of Monte Video, but we are happy to state that the whole of the officers and crew were saved. H.M.'s steamer Ardent was very nearly meeting with a similar fate. She parted with her anchors, and the strength of the current was carrying the vessel towards the shore, when she came in contact with another ship of greater bulk than herself, which stopped her progress, and enabled the crew to secure her. During the same gale, further up the coast, at a place called Bucco, no fewer than fourteen vessels were stranded, two of which are reported to be ships of war.

NEW SOUTH WALES.—The *Sydney Herald* states that three ships at the date of the last advices were loading with horses for different ports of India. A thousand good, serviceable horses can be procured in Sydney for 10,000*l.*, or at most 12,000*l*: the value of these in India are estimated at 60,000*l.* The cost of transport and agency expenses would amount to about 35,000*l.*, leaving a clear profit to importers of 25,000*l.*

Parliament.

HOUSE OF LORDS.

Friday.—After the division in favour of the Irish Law Courts Bill, several conferences took place with the Commons, but nothing of particular interest transpired. One or two other subjects were afterwards shortly discussed, and their Lordships then, upon the motion of Lord WHARNCLIFFE, adjourned until the 2d of September.

HOUSE OF COMMONS.

Friday. We gave in our last a brief notice of Lord JOHN RUSSELL's speech on the close of the session; and in order to complete our record, we now give a more detailed summary. His Lordship said, that during the late administration it was customary, at the close of each session, to distribute a pamphlet, purporting to be a speech of Lord Lyndhurst, and setting forth the little which Ministers had done. This he himself had never thought a very fair proceeding; 1st, because no Ministers could so control the Legislature as always to insure the passing of their measures; and, 2d, because the Peers almost all belonged to the political party which opposed the late Administration. If he were now disposed to follow that example, he might do it less unfairly, because the present Ministers had in both Houses a majority placing confidence in their Government; but the practice seemed to him to be productive of no public good, and he should decline to follow it. It might not, however, be useless at this period to take a general view of the state of the country as it now was, and as it probably might be when Parliament should re-assemble. Sir R. Peel had formerly said that his chief difficulty would be Ireland, and, after that declaration, it was surprising that the Government had never taken the state of that country into their serious consideration with a view to improve its condition. In the last year they would have done well to issue an early proclamation forbidding the repeal meetings, and announcing an intention to adopt measures of improvement and conciliation. Instead of that, the popular leaders were allowed to go on for many months unchecked. At length they were interrupted, and the chiefs were brought to trial; not, however, for their latest acts, but for the whole course of their proceedings during eight or nine months. They were tried by a jury not including a single Roman Catholic, but comprehending several violent Protestants. What good effect upon the public mind could be expected from a verdict given by a body of men, not one of whom professed the religion of the great majority of the Irish people? He hoped that during the recess Government would reconsider this important subject, would adopt the principle of the Union—that Ireland should be governed by the same laws with England. Whatever might be the opinion of the Judges or of the House of Lords, the wisest course for the Government, as a matter of state policy, would be the discharge of Mr. O'Connell. They should consider that, whatever his proceedings might have been, he was the man who had won the political franchise for his country, and that he was now, at 69 years of age, approaching the close of his political career. By releasing him forthwith Government would prepare the popular mind in Ireland to receive with favourable dispositions the good that might be intended for them, instead of carping, as they now did too often, with an unfortunate, but perhaps natural distrust, at measures sincerely intended for the welfare of Ireland. He would not think so meanly of Sir R. Peel as to believe that he would be deterred from a sound policy by the fear of alienating his own extreme partisans. The state of our foreign relations was such as to make this subject both a delicate and an important one; he alluded to Africa and to Tahiti. On both these subjects he considered Sir R. Peel to have given pledges, which Parliament, on its re-assembling, would expect to see fulfilled. With one or two exceptions, there had been no period since the peace when our foreign affairs were in so anxious a position. Though England should possess the strongest Army and the strongest Navy, there was another element of strength, which it was still more important to secure—the united feeling of Her Majesty's subjects. Another most important topic was the general condition of the people, the scanty means and severe toil of the labouring people, especially in the manufacturing districts. The condition of the labourers had not improved with the increase in the luxury of the higher and in the comforts of the middle classes. Unless Government should in the next session propose some measure, removing at least all restriction upon their means of employment and subsistence, he would himself originate a motion on that subject; not seeking to repeal the present Poor-law, nor to maintain the poor by a state charity, but tending to give them the means of maintaining themselves. The great question of the import duties ought to be considered. The new constitution of the currency was a wholesome proceeding; but the Corn-law required the attention of Parliament, though not without a due and fair regard to the rights of the agricultural interests, who were especially pressed by the malt-tax and the county rates. The emigration question also was of great importance, and he hoped it would not escape the attention of Government. He must observe too upon the waste of time at the beginning of each session, and the hurry and pressure of business at its end. Bills were sent up to the other House and down to this without sufficient time for either assembly to deliberate upon their contents. He had made these observations in no party spirit, but with a sincere desire to point out important public objects upon which both sides of the House might agree.—Sir R. PEEL gave credit to Lord John Russell for the absence of party spirit in his speech. He agreed in several of his observations. He thought there was little advantage in the modern protractions of the session. Mr. Burke had expressed an opinion that it was not desirable to retain Members in London during a very large part of the year, to the neglect of their local duties. He was not without hope that, by a concurrence of parties some better arrangement might be devised; indeed it had really become almost impossible for Ministers to give so long an attendance as at present in the House of Commons, and at the same time satisfactorily to perform their official duties. He regretted the vague intimations which the noble Lord had thrown out with respect to the condition of the people, because such language tended only to excite expectations which it was impracticable to fulfil. The increase of population in every country had a natural tendency to accumulate difficulties on this subject. The noble Lord had held out some hopes to the agriculturists of what he would do for them; but, for his own part, though he was glad to hear this acknowledgment, from such a quarter, of the existence of burdens peculiarly pressing upon agriculture, he must decline to give any pledges for the remission of that particular impost to which the noble Lord had especially adverted—the malt-tax. There never had been a session in which more of useful business had been done than that which was now about to close. The Ecclesiastical Courts Bill, indeed, had not been carried through; but other measures of great value had been completed. As the noble Lord had declined to enumerate them, he would specify them himself. First, there was the Poor Law Amendment Bill, debated with the greatest temper, and brought to a conclusion satisfactory to most even of those who at first were adverse to it. There was the measure for regulating factory labour; there was the measure for reducing the Three and a Half per Cents, by which 1,200,000*l.* of annual taxation had been saved to the country, mainly through that honest adherence to public faith which he called on other countries to imitate; there were the measures respecting Currency, Joint-stock Banks, Joint-stock Companies, and Abolition of Imprisonment for Small Debts. There were other measures of importance, touching religious questions; the Dissenters' Chapels Bill, which had superseded so much useless litigation; the Irish Presbyterian Marriage Bill, and the Irish Charitable Donations Bill. Measures, too, had been passed, less, indeed, in importance, but adding to the aggregate of good effected—relating to Railways, to the Duchy of Cornwall, and to Metropolitan Improvement. Reference had been made to the recent jury process in Ireland. On this subject he appealed to the decision of the Irish judges themselves, Mr. Justice Perrin included. He denied that Government had foreborne from an earlier suppression of the Repeal meetings with any view of entrapping the culprits into further offence. As to the recommendation for remission of punishment, that was a matter of prerogative, upon which he would observe a total silence; but he denied that there was any wrong which it lay on the conscience of Government to repair. The adjournment he had proposed was partly, but not wholly, owing to the writ of error on those Irish trials. It was not just to give out that nothing had been done for Ireland. A most important step had been taken in the appointment of the Land Commission; and it was the intention of Government, during the recess, to consider the important questions of Academical Education and the state of Maynooth. The Irish Municipal Bill had not indeed been carried, but it had been introduced, at all events, with the sincerest desire to do good; and he trusted that if the honour or interest of the Crown should require an appeal to the people, the Irish nation would be found the cordial and united defenders of the crown of their Sovereign. In respect to revenue, trade, employment, and general comfort, the state of this country was greatly improved since the year 1841; and he made this observation, not for the sake of a party contrast, but of a substantial congratulation.—Mr. BELLEW made some observations on the state of Ireland.—Mr. HUME said that, though there might have been some change for the better, the state of our population was not one with which Sir R. Peel would be content. The working classes were still in a suffering condition, and the question was, whether that suffering might not be mitigated? Let Government consider the proportion of taxation borne by the poor. If they would remove all duties upon raw materials, and give full scope to British capital and industry, he should himself have little apprehension. As to Mr. O'Connell, he believed the general opinion to be that, from the composition of his jury, he had not had a fair trial. It was gratifying, however, to see the spirit of conciliation which, during the latter part of the session, the Government had evinced.—Mr. COCHRANE had nothing to regret but that Sir R. Peel had held out no hope of further amendment in the Poor-law. He gave credit, however, to Sir J. Graham for his temper and courtesy in the conduct of the new Bill. He lamented the distresses of the people, and intimated an opinion that a Bill for regulating the wages of labour would do something to relieve the existing evils.—Mr. VILLIERS observed, that Mr. Cochrane thought too much about providing for pauperism, and too little about preventing it. He protested against the opinion in which Lord J. Russell and Sir R. Peel seemed to agree, that agriculture laboured under some especial burdens. The county-rate was not borne by agriculture alone, but by property of all kinds; and, as to the malt-tax, what indemnity was it for a tax on beer, to lay a tax on bread? Let not gentlemen believe that this bread-tax question would ever be settled, till they made up their minds that it should be settled as it ought to be. They must reduce their rents; the farmers themselves were discontented at the perpetual interference with their business by promises of legislative protection.—Colonel SIBTHORP agreed with Sir R. Peel, that there had been more real business done in this session than in the ten preceding. He would not follow Mr. Villiers into the Corn-law argument; but he would congratulate the country on the flourishing state of the harvest, and the declining state of the League.—Lord EBRINGTON thought Colonel Sibthorp very forgiving; for that gallant officer had opposed almost every one of the measures which Sir R. Peel had taken credit for carrying.—The motion for adjournment to Thursday, Sept. 5, was then agreed to.

CITY.

Money Market, Friday. — Consols for account closed at 98 ⅞. Reduced Three per Cents. 99⅝. Three-and-half per Cent. Red. 102⅜; New Three-and-half, 101½; Exchequer Bills 73 75, pm.; Bank Stock, 199¾.

BANKRUPTCY ANNULLED.—EDWARD RILEY, Stratford-upon-Avon, grocer.

GAZETTE OF THE WEEK—BANKRUPTS.—C. J. BANNISTER, Derby, linendraper—H. A. ROGERS, Sheffield, newsman—T. SLATER, Barnley, Lancashire, pawnbroker—J. ROTHERY, Golcar, Yorkshire, clothier—J. MICHAEL, North Shields, general dealer—B. O'BRIANS, Bath, wine-merchan—W. LAW, Reading, Berkshire, draper—H. C. YORK, Chesterman-place, Westminster road, lodging-house-keeper—P. COCK, Limbeth-walk, painter—H. C. WALTON, Liverpool, surgeon—J. C. and G. H. WHITE, Bath, musicsellers—J. TAYLOR, Deritend, Birmingham, victualler—J. SIMMS, Rochdale, Lancashire, flannel-manufacturer—G. S. RUTHERFORD and S. RUSSELL, Sheffield, britannia metal manufacturers—H. WEST, Burgh, Lincolnshire, grocer.

SCOTCH SEQUESTRATIONS.—J. BROWNING, Kilmarnock, auctioneer—W. C. JOHNSTONE, Dinkeld, surgeon—G. M'LEOD and J. ANDERSON, Glasgow, warehousemen—R. CRAWFORD, Greenock, farmer.

Metropolis and its Vicinity.

The New Houses of Parliament.—The following is an abstract of the second Report from the Lords' select committee on the progress of the building of the Houses of Parliament. That the committee appointed last session recommended that the architect should so conduct his operations as to secure the occupation of the new House of Lords, with temporary fittings, at the commencement of the session of 1844, and if he should find that more time would be required, that he should report the same to the Commissioners of Woods and Forests, in order that such report might be communicated in due time to the House. That instead of the new House of Lords being covered in by Christmas last, as was stated to be practicable by Mr. Barry, in his evidence last year, it is now only in course of erection. That Mr. Barry now states, that if great exertions are made, the House of Lords, the lobbies at each end of it, the corridors connecting the same with the front building and the libraries, the committee and other rooms belonging to the House of Lords, may be covered in before winter; and the committee having examined the building, with the clerk of the works and one of the contractors, are of opinion that the whole of these apartments may be prepared for the use of the Lords by April next. That the committee do not recommend that any temporary fittings should be prepared, but that all the works connected with the buildings above mentioned should be advanced with the greatest possible speed. And the committee have examined Mr. Barry with respect to the style of internal fitting and decoration, and he has distinguished those parts of the building to which he considers the more costly and elaborate style should be applied. In respect to the remaining portions of the internal arrangements, the committee entertain the strongest opinion, both in reference to economy and despatch, that the committee rooms and secondary apartments should be completed in the most simple and solid manner consistent with the character of the general building, but not involving any extraordinary expenditure. In respect to the deviations from the original plan, it has been satisfactory to learn that they have not been of a character to vary or affect the builder's contract; and that no future deviations are to be allowed, without the previous sanction and authority of the Commissioners of Woods and Forests.

New Royal Exchange.—At the meeting of the Common Council on Friday, Mr. R. L. Jones said that, from all the information he had been able to obtain, there was every possibility that the Royal Exchange would be opened before the expiration of the present shrievalty, that is, before the end of September. He was not aware that anything was likely to prevent it.

Statue of Prince Albert.—A marble statue of His Royal Highness, executed by the sculptor Wolff, was landed at the St. Katherine's-docks last week, out of the ship Mary Ridgway, from Leghorn, and forwarded to Windsor Castle, without being previously opened and examined by the officers at the docks.

Captain Warner's Invention.—Capt. Warner has addressed another letter to the daily papers, in which he states that, "to satisfy the curiosity of all those who *profess* to disbelieve my power, in order that they may worm out my modes of operation, or to remove the real doubts of many others, would be alike equivalent to a surrender of secrets which it has cost me the greater portion of my life, and all my fortune, to attain. But I pray the public to observe, that if Her Majesty's Commissioners had accepted the offer I deliberately and distinctly made to them in May last, and taken the John of Gaunt into their own custody, I should have been saved much inconvenient expense, and none of the doubts cast upon me, as to a secret communication with her at the time of her destruction could have been raised." In reference to the Shoreham pilots, whom Capt. Pechell mentioned in Parliament as having seen several suspicious ropes, &c., about the vessel, Capt. Warner says:—"But I can unfold to the public what Capt. Pechell did not represent to Parliament—the source of the animosity of his worthy informants. These very men coolly took possession of two best bower anchors and two chain cables which I had left with buoys attached to them in Shoreham roads; and when I insisted on their restoration, they had the impudence to dispute my right to my own property; and it was only by the active co-operation of Lieut. Pratt, of the Coast Guard, and his men, and also of the Custom-house officers, that I regained possession of any portion of them. In spite of our efforts, the wreckers managed to steal one of my boats, the gig; and I had the utmost difficulty in rescuing the launch from their rapacious grasp. The tow-rope which they picked up, and which has puzzled them and their worthy representative so much, had an anchor attached to it when cast off, for the simple purpose of saving it, I having paid 25*l.* for the tow-ropes a few days before. Will Capt. Pechell, or any other seaman, be kind enough to tell me in what other way I could have saved my tow-rope?" He concludes by saying, "The Hon. W. Cowper asserted in the House of Commons that I have offered the invention, which I exhibited off Brighton, to the Prussian Government, and that my offers were rejected. I most distinctly and unequivocally deny that I ever offered the invention in question to the Prussian or any other Government than my own; and I

challenge Mr. Cowper to prove his assertion. I had intended offering to the public a few observations upon the unfair remarks of Sir Howard Douglas, Sir G. Cockburn, and Sir C. Napier; but I will for the present desist, with an earnest solicitation for a little space for that purpose upon another day, when I have no doubt of being able to convince both the Prime Minister and the public that they have respectively been most grossly deceived as to the real importance and value to the country of my discoveries. I have been silent under cruel misrepresentation; I mean presently to speak out."

The Projected Embankment of the Thames.—The Bill recently introduced by Government relative to the Thames embankment, was published last week. It is entitled, "A Bill to empower Her Majesty's Commissioners of Woods to form a Terrace and Embankment, with convenient Landing-places for the Public, on the Middlesex shore of the Thames, between Westminster and Blackfriars-bridges." The measure, which was under the care of Lord Lincoln, M.P., and Sir G. Clerk, contains no less than 84 clauses, with a copious schedule. It is, of course, laid on the shelf until next session, being merely brought in and printed for the information of members, and to afford them an opportunity of considering its provisions during the recess. Power is given to the Commissioners to carry out the purposes of the act, the expenses to be defrayed out of the fund to be created for the execution of improvements in the metropolis. The third clause, which will most interest the public, empowers the Commissioners to make and construct a raised terrace, or communication from or near Whitehall-place, along the shore of the river, on the Middlesex and city of London side, to Chatham-place, Blackfriars; also to embank certain portions, on the Middlesex side, from Westminster-bridge to the intended roadway, at or near the northern pier of the Hungerford Suspension-bridge, and also from time to time to alter, widen, divert, and remove all causeways, piles, stairs, hards, or landing-places, on the shore of the river, or projecting from the bank between Westminster-bridge and Chatham-place; and to drive other piles, and construct other causeways, piers, stairs, &c., in such situations and in such manner as they shall deem best suited to the convenience of the public, to remove all mud-banks and obstructions on the bed or shore of the river, to deepen, scour, and cleanse, the same bed or shore on the Middlesex side, to dredge and deepen any other parts of the river between Westminster-bridge and Chatham-place; to make and maintain all necessary and convenient ways and communications from Whitehall-place, Villiers, Savoy, Wellington, Surrey, Norfolk, and Arundel-streets, to the intended terrace and roadway, and to construct and maintain all necessary viaducts, roads, bridges, embankments, and other necessary works. The remaining clauses relate to the details of measures by which the purposes of the act are to be carried into effect.

Metropolitan Improvements.—The old house in West-street, Smithfield, which was noticed in our last, is now nearly levelled to the ground. Fifty other houses of a similar character which adjoin Mallet's Court, where the famous dog-pit was situated, are to be sold this day. The spot is adjacent to the Fleet-ditch, which notwithstanding the improvements in the neighbourhood, runs for a distance of some hundred yards uncovered, disseminating the pestilential odours from all the sewers in the vicinity. All the houses are in a most dilapidated condition, being without windows and mostly without doors, and another spot of equal wretchedness is not perhaps to be found in any part of the metropolis. The misery of the inhabitants however arises more from debauched habits than poverty. This spot has been visited by many of the city authorities, and all who have inspected the condition of the district and its inmates have expressed surprise at such a spot existing in the very centre of civilisation.—The new street from Spitalfields to the Docks is rapidly advancing. Among the houses pulled down this week in its line of course was the mansion in Essex-street, Whitechapel, which was occupied by the Earl of Essex, the favourite of Queen Elizabeth, shortly before his death. It was situated on the east side of Essex-street, and at the rear of the houses forming that street; it was three stories high, and the attic windows were latticed; there was a part of the spacious staircase remaining, and the joists and girders were in as good preservation as when originally placed in the brickwork. At a short distance from this spot, between Elliston-street, Petticoat-lane, and Houndsditch, is another large mansion, which will be demolished in a few days. This was the palace where Queen Elizabeth occasionally resided. The building is four stories high, and some of the windows are latticed. The ceilings of the ground and first floors are ornamented with different devices, coats of arms, figures, &c, among which may be distinguished roses, fleur-de-lis, and the word "Britannia." There are also several Latin inscriptions, scarcely legible, and a quantity of oak-panelling in various parts. The premises were for some years latterly used as a common lodging-house, where beds were let out at 3*d*. a-night, and it was known as the "big-house." The rooms are now used as carpenters' workshops.

East India Company.—A dinner was given by the East India Company on Wednesday evening, at the London Tavern, in honour of those distinguished officers, Sir W. Nott and Sir R. Sale. The Chairman of the Company, Mr. Shepherd, presided, and among the guests were Sir R. Peel, the Chancellor of the Exchequer, Lords Ripon, Eliot, Lincoln, Dalhousie, and G. Somerset, Sir G. Murray, and other Cabinet Ministers, the Lord Mayor and Sheriffs, and the principal city authorities. Sir W. Nott was absent from indisposition, but Lady Sale accompanied her gallant husband, and was present in the gallery with Lady Nott and Mrs. Sturt. After the usual loyal and routine toasts, the health of Sir W. Nott was drank with all the honours, accompanied by an expression of regret from the Chairman that his health was too much impaired by the campaigns of Candahar and Ghuznee to allow him to be present. The Chairman then rose, as he said, with the greatest anxiety to discharge a debt he was most anxious to acknowledge, namely, to propose the health of his esteemed and gallant friend, Sir R. Sale. Sir R. Sale had served in India for upwards of forty-five years. In the records of the Burmese war his name was among the foremost; but it was left for him to complete his success on the opposite side of India. The march to Jellalabad needed not to be recalled to the recollection of the company present; nor the defence of that fortress—a fact memorable in the military annals of India. To the indomitable courage and unflinching zeal of Sir R. Sale was to be attributed the successful result of that formidable struggle in which this country was engaged in the East. Jellalabad and Candahar were the green spots in the wilderness — the oases in the desert—the rallying spots for despair—and Sir R. Sale had not only held the former against the hosts of Akbar Khan, but he had also proved that no enemy, however powerful, and however daring, could quench the fire or extinguish the energy of a brave man. It was, however, impossible for him to mention Sir R. Sale without also associating with him the name of his heroic lady—(enthusiastic cheering)—a lady, whose noble constancy, whose heroic spirit, and whose never-failing self-possession, had exhibited on that occasion, not only a noble example to her own sex, but one well worth imitation by the best of the other sex. He therefore proposed, with the most heartfelt pleasure, "Long life and happiness to Sir R. Sale and his distinguished lady." The toast was drunk with more than the usual honours, and great cheering in addition.—Sir R. Sale then stood up, amidst the loudest acclamations of applause, and said—"It is with extreme diffidence that I rise on this occasion to return you my best thanks for the excessive honour you have done me this night. As a soldier it is most gratifying to me to receive such a mark of your favour. I feel it so, but I feel it more on the part of my companions in arms. It has been my fortune to serve in India for many years, and during that period I have commanded the troops of the East India Company—on most occasions to my entire satisfaction. There are no troops in the world who will follow you more devotedly than the Sepoys, and since the affair of Jellalabad, I am satisfied that there are not finer soldiers in the world. The Officers, too, whom I look upon as brothers, are as jovial and as jolly a set of fellows as there is in existence. (Loud cheers and laughter.) They all knew we were in jeopardy at Jellalabad, but they were one and all determined that, if the enemy obtained any advantage over us, it should cost them dearly." (Cheering.) The gallant officer concluded by repeating his thanks and offering his acknowledgments to the company for the honour accorded him, which were received with great applause. The Chairman then proposed "The health of Sir R. Peel, and Her Majesty's Ministers. Sir R. Peel said, "I return you my most cordial thanks for the honour you have just conferred on me. And I return also my grateful acknowledgments to the directors of the East India Company for having permitted us to be present on an occasion when we have met to do honour to two gallant officers so distinguished by their exploits in India. I deeply regret, however, the absence of one of Her Majesty's servants, distinguished by all men as the first military commander of the age—but I should regret it much more if I was not aware that he had an opportunity—which he did not let pass—of doing justice in the House of Lords to Sir W. Nott and Sir R. Sale. That act of his was among the highest rewards which they could have received. It would have been a subject of additional regret to me if my Right Hon. Friend Sir G. Murray had not so well occupied the place of my Noble Friend the Duke of Wellington on this occasion. Sir W. Nott and Sir R. Sale have received high but not unmerited distinction. They have received the favour of their Sovereign, they have, on the recommendation of the Duke of Wellington, received the thanks of the House of Lords, and it has been my grateful duty, however unworthy of the office, to propose to them the thanks of the Commons of England, for their great military achievements in India. I had on that occasion the satisfaction of seeing, in that arena of political strife which daily resounds with acrimonious attacks, all parties unite in doing honour to those men who maintained the character of the country. There was but one thing wanting to complete the reward of those distinguished individuals—namely, that a company like this, which may be fairly said to represent all the great interests of the country—the East India Company—the commercial interests of England, Her Majesty's Ministers, and the body of the community, should meet to do them honour, in addition to the favour of the Crown and the votes of Parliament. The absence of one of these eminent men I most deeply regret; but I do rejoice, and while I live I shall never forget that I have been present when Sir R. Sale received from you the demonstration of public favour in the presence of his heroic lady—(Enthusiastic cheers)—who has, by her noble conduct, shed a double lustre on the name of Sale. (Renewed cheering.) We are not now merely returning our grateful acknowledgments to these distinguished individuals, but we are proving to the country that if any of our fellow subjects shall be placed hereafter in the position of Sir R. Sale, however distant may be the scene, whether at Waterloo or within the shattered walls of Jellalabad, if they do their duty there are millions of British hearts in sympathy with them, and millions of British voices resounding with grateful acclamations." (Great cheering followed the speech of the Right Hon. Baronet.) Several other speeches followed, among which was one by Sir J. Bryant, who proposed the health of Lady Sale, which was drank with the greatest enthusiasm.

Meeting of Magistrates.—A meeting of the magistrates of Middlesex took place on Thursday, when Mr. Sergeant Adams, the chairman, announced that he had that day received a communication from Sir J. Graham, stating that Her Majesty had been pleased to appoint him Assistant Judge of the court established by the new Bill for the better administration of criminal justice in this county. A presentment by two justices, Mr. Roth and Mr. Townsend, to the effect that the New Prison was unfit for the purposes for which it was intended and used, was laid before the court. The keeper was then sworn, and gave evidence in confirmation of the presentment. The gaol, he said, contained a vast number of inconveniences. It was not suited to carry out the rules and regulations of the various prison acts. In his opinion it could not be made suitable. The sun never reached some of the yards, which were surrounded by a continual damp atmosphere even in the middle of summer. The classification required by the act could not be carried out without rebuilding the gaol altogether. The visiting justices had always regretted the formation of the gaol. When the ventilation was bad, they opened the windows during the night. The drainage was bad, but measures were now in progress to deepen the drains. They had insane prisoners sent there sometimes, but had no place but the infirmary fit for them. When a lunatic was there the patients were subjected to much annoyance. They had two insane prisoners there some time ago, and at this time two patients were ill of a fever. By the new Act of Parliament the evils and inconveniences would be greatly increased, and the inspectors of prisons had expressed their dissatisfaction with the building in their Reports. Several magistrates confirmed these statements, and the Chairman stated on the authority of the county surveyor, that the plan for a new prison, submitted to them by Sir James Graham, if adopted, would not cost above 30,000*l*. After considerable discussion, it was resolved unanimously, that a committee be appointed to consider the requisite steps for carrying into effect the plans laid before the court by Sir J. Graham, or any other plans which may be approved of, to obtain estimates of the expenses of the several plans, and report at the next Michaelmas sessions. The Report of the committee appointed on 14th Dec. last, to inquire into the state of pauper lunatics in the county, and to report on the best means of providing for the complete and efficient accommodation of such lunatics, was read. This Report confirmed the statement that several hundreds of the poor lunatics of the county were deprived of the means of cure, and recommended that additional accommodation should be forthwith provided. Mr. Pownall trusted that they would at once act upon the suggestions of the Report, and moved that it be printed and circulated, and that the committee be directed to open negotiations with a view of securing 20 acres of land in the immediate vicinity of Hanwell, and report to the court next county day. The resolution was opposed by Col. Wood, M.P., and others, but after a long discussion it was ultimately carried, several magistrates explaining that they voted for it on the understanding that the proposed new building was to form part of the present asylum.

London Missionary Society.—A meeting called by this Society was held on Wednesday at Exeter Hall, for the purpose of expressing an opinion upon the recent conduct of the French at Tahiti. Mr. F. Smith, chairman of the Society, presided. Mr. Pritchard, our Consul, who has lately returned to England, sat on his right hand. The body of the hall was about two-thirds filled. The Report, which was read, entered into the history of British connection with Tahiti, from the earliest visits of missionaries down to the present time, and strongly deprecated the conduct of the French in their recent aggressions. Dr. Winter Hamilton, of Leeds, proposed the first resolution, to the effect, that reviewing the history of the missions of this Society in Tahiti, and numerous other islands in the South Pacific Ocean, during the past 48 years, and remembering the former idolatry and degradation of the natives before the blessings of Christianity were communicated to them, and the delightful change which, through the instrumentality of this Society and the favour of Heaven, had crowned their efforts, they regarded the recent events as threatening not only the prosperity, but the very existence of these missions. The resolution was unanimously adopted. Many other gentlemen addressed the meeting, and other resolutions of the same character were agreed to

The Polish Refugees.—A short time ago several of the Polish refugees in Paris and London petitioned the Emperor of Russia for permission to return to their native country. On the 31st ult. the Poles in London were informed by the Russian Consul that the Emperor had granted their prayer, upon condition that they should pass through Holland to a town of the name of Kowno, in Russia, there to surrender to the Russian Government, and submit to a trial upon such charges as might be brought against them. It was believed that the trials were merely of a formal character, and that at their conclusion the Poles would proceed direct to Warsaw. When those in London heard the terms offered by the

Emperor, several of them, particularly those who took a leading part in the insurrection, refused to accept them, fearing that they should have no chance of showing their innocence, and that from Kowno they should be sent to Siberia. Since the offer was made, those who appealed for the amnesty have received a communication from the Russian Ambassador, stating that their liberty was granted, upon condition of their proceeding to Poland through Holland, and, moreover, that as many of them were in a state of poverty, and unable to bear the expenses of travelling, a sum sufficient for the purpose was placed at their disposal by the Russian Government. On Sunday last 13, two of whom have married in England, quitted London in the Rotterdam steam-boat, amongst them being Count Golyowski and M. Nowacb, who, about a year ago, committed an assault on Lord Dudley Stuart. Some of the Poles remaining in London are deserters from the Russian army, and to them no pardon has been offered.

The Art-Union.—The annual meeting of the subscribers to the Art-Union of London was held on Tuesday in Drury-Lane Theatre, H. R. H. the Duke of Cambridge in the chair. The Report, after alluding to the late proceedings in reference to Art-Unions, stated that the subscription for the present year amounts to 14,848*l.* 1*s.*, being an increase of 2513*l.* 11*s.* over that of last year. The amount set apart for the purchase of works of art was 8590*l.*, which was allotted as follows:—

Fifty works of art, of the value of 10*l.* each	£500	Twelve, of 60*l.* each	£720
Thirty-six, of 15*l.* each	540	Eight, of 70*l.* each	560
Forty-two, of 20*l.* each	840	Six, of 80*l.* each	480
Twenty-eight, of 25*l.* each	700	Six, of 100*l.* each	600
Twenty five, of 30*l.* each	750	Two, of 150*l.* each	300
Twenty, of 40*l.* each	800	Two, of 200*l.* each	400
Fourteen, of 50*l.* each	700	One, of	300
		One, of	400

To these were added 30 bronzes of the "Bust of Hebe," making in the whole 283 works of art. The report stated that the reserve fund amounts to 1202*l.*, and urged the payment of subscriptions for the purpose of increasing it. The necessity of obtaining more ample apartments, and of a gallery for the exhibition of works of art purchased by the prizeholders, was also adverted to. After the reading of the Report, the Duke of Cambridge retired, and Lord Monteagle presided during the drawing of the lots. The following were the principal prizes:—400*l.*, Miss C. Hemmington, near Lonsdale. 300*l.*, Mr. George, 92, Cheapside. 200*l.* Mr. Sanders, Burton-upon-Trent; and Mr. Flamman, Tavistock. 150, Mr. Hazlitt, Hounslow; and Silentio. 100*l.*, Mr. Kelburn, Port Philip, Australia; Mr. Collingwood, Liverpool; Mr. Watlington, Bedford-place; Mrs. M'Queen, Tottenham-court-road; Mr. Chancellor, Bolton.

Navigation of the Thames.—On Thursday the committee again assembled at Guildhall, for the purpose of hearing the objections to the suggested regulations in the government of steam vessels on the Thames. The Lord Mayor took the chair, supported by Aldermen Lucas, John Johnson, Kelly, Farncomb, and Musgrove. Several members of the Navigation Committee, steam vessel owners, and others, stated their objections to many particulars in the regulations, and offered suggestions on the subject, which were entirely of a technical nature. The Lord Mayor informed them that the committee would immediately take into consideration the objections they had made, and adopt a course which he had no doubt would be favourably received by the public.

The Convict Dalmas.—This convict has been removed, by order of the Secretary of State, from the Milbank Penitentiary to the insane ward of Bethlem Hospital, there to be confined during Her Majesty's pleasure as a lunatic. It is said that the report of the medical men who have daily visited Dalmas since his incarceration in the Penitentiary, leaves but little doubt of his insanity.

The Newfoundland Church Ship.—A schooner yacht, called the Hawk, of about 60 tons, has been given to the Bishop of Newfoundland, by the Rev. Mr. Eden, rector of Leigh, to be used as a church in the smaller and more remote settlements, where there is no permanent church, and also to convey the bishop from place to place in his visitations. On Saturday the Bishop of London accompanied by several of the clergy, by Sir H. Douglas, M.P., Mr. Acland, M.P., Mr. Cotton, Governor of the Bank of England, and other friends, paid a visit of inspection to the vessel, and examined the missionaries who are about to proceed in her to Newfoundland. The Hawk has been supplied with the necessary ecclesiastical fittings, such as plate, an altar, table, books, &c., for the celebration of divine service, by the private contributions of the friends of Bishop Feild.

The Abolition of Imprisonment for Debt.—The above Act, which received the Royal assent on Friday by commission, came into operation on Saturday, when a number of debtors who had been imprisoned in the different metropolitan prisons for debts under 20*l.*, were liberated. The same course will be adopted in all the other gaols for debt throughout the country, with the exception of those who stand committed for penalties due to the Crown. The Sheriffs of London and Middlesex have given directions to the keepers of the respective gaols in the county, not to take in any person whose debt is under the sum stated in the Act.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending August 10th.—West Districts, 122; Northern, 197; Central, 178; Eastern, 209; Southern 228; Total, 934. Weekly average for the last five years, 916.

Provincial News.

Bodmin.—The execution of the murderer Weeks took place on Monday at the county gaol here. The unhappy man was reported several times to have died since the passing of the sentence; and in a state chiefly of unconsciousness the time passed away with him from that period to his last hour. He made an entire confession of his guilt, of which, indeed, the evidence adduced on the trial did not leave a doubt.

Buckingham.—The Marquis of Chandos will attain his majority on the 10th of next month, and great preparations are making at Stowe to celebrate the event. A meeting was held on Monday in this town, at which the Mayor presided, to consider the best means of celebrating the event; a series of resolutions were adopted for the furtherance of this object, and congratulatory addresses were voted to the Duke and Duchess of Buckingham and the Marquis of Chandos. All the poor in the neighbourhood of the Duke's estates are to be regaled on the occasion with old English cheer.

Cardiff.—The local papers state that Sir J. Guest, Bart., the proprietor of the Dowlais iron-works, has recently received an order from Russia for 50,000 tons of iron, for the purpose of being used in the construction of railways in that country.

Carlisle.—From Cumberland we learn that the sport on the moors in Cumberland and Westmoreland on Monday the 12th, was excellent. Birds were plentiful, but it required the greatest ingenuity to come within range of them, as they were universally strong on the wing. All the accounts agree in stating that the birds are numerous, but, in consequence of the long continued dry state of the weather during the hatching season, they are packed and remarkably wild.

Deal.—The Safety Beacon erected about a year ago, by Capt. Bullock, R.N., was run down last week by a Dutch galliot and destroyed. The Lords of the Admiralty, however, have ordered that another be placed on the same spot immediately, and on the principles of the old one.

Durham.—Wednesday, the 28th inst., has been fixed for laying the foundation-stone of the temple to be erected to the memory of the late Earl of Durham, on Painshaw Hill, in this county. An invitation having been given by the building committee to the Freemasons of Durham and Northumberland to attend the ceremony, a provincial lodge was held at Newcastle last week, at which it was resolved to accept the invitation, and testify once more their respect for the memory of their late grand-master. The Earl of Zetland has promised to lay the foundation-stone. It is expected that the temple will be completed early next summer.—A cruel murder was perpetrated at High Eighton, in this county, on Saturday. It appears that a potato-field, belonging to Mrs. Mitcalfe, of that place, had suffered severely from depredators, and Mr. Fleck, manager of the farm, had placed a watch to prevent a recurrence of these losses. On Saturday night last, he sent two young men to see that all was right, when, on passing through the fields, one of them, called Robson, was shot dead by a man concealed in the hedge. No less than 187 shots were found in his body. An inquest has been held, but adjourned for further evidence, no clue having been obtained to lead to the detection of the murderer.

Gravesend.—On Tuesday the Russian frigate Aurora weighed anchor and left Gravesend, where she has been lying for nearly a month, on her return to St. Petersburgh with despatches for the Emperor.

Isle of Wight.—Mr. Commissioner Goulburn, in the Court of Bankruptcy, last week gave judgment in the case of the Isle of Wight Bank, *in re* Roe and Blatchford. After adverting to the various charges brought against the bankrupts, which he considered to be substantiated, and to be attributable to false representations on their part, he said that neither partner could acquit himself. The official assignee, in answer to a question by the Court, said that the debts amounted to upwards of 100,000*l.*, but from the uncertain nature of the assets he should think that the dividend would not probably be more than one shilling in the pound. The Commissioner having gone through a full review of the facts, as detailed in the evidence, proceeded to say that there was a great difference in this case from that of persons who had got into difficulties from misfortune or from circumstances over which they had no control; but here was conduct grossly fraudulent, and he should be giving way to a morbid sympathy if he were to decide this case upon the same footing as that of an honest trader. Under the whole of the circumstances, as evolved in this extraordinary case, he felt it to be his duty to refuse the certificates of both the bankrupts.—The local papers mention, with much regret, that a piece of land surrounding Carisbrooke Castle, is about to be sold on building leases, and they complain that this measure will seriously injure the most interesting historical monument in the island. It appears that the range of land is partly in grass, and partly adorned with flourishing plantations, and in front and on one side it constitutes a part of the slopes of the eminence on which the castle stands. This land is thus essentially connected with the castle, forming an important feature in its beautiful scenery, and was part and parcel of the castle domain, until separated from it, in some unknown manner, about the period of the Commonwealth. The late Lord Bolton, when Governor of the Isle of Wight, purchased it from the then proprietor, solely with the view of preserving it from the builders. His Lordship's heir having no connexion with the island now wishes to dispose of it. It is said to have been offered to the Crown for 1200*l.*; but the Crown has hitherto declined to purchase, and it is now advertised for sale by auction on the 20th inst., parcelled out into small lots for building purposes.

Liverpool.—The Thomas Bennett, a fine American ship of 483 tons, which sailed from Liverpool for Charleston on the 3d inst., with a general cargo, worth about 30,000*l.*, has put back to this port in consequence of the murder of her captain on the high seas. It appears that 5 days after leaving Liverpool, Capt. Halsey, while in a state of intoxication, was irritated at some delay in getting his dinner, and proceeded from the cabin to the cook-house on deck, in which the steward and cook were employed in dressing the victuals. The cook was in the act of peeling potatoes, and had a large sheath knife in his hand for that purpose. The captain, in the first instance, seems to have abused the steward about the preparation of the dinner, and then snatched a large table-knife out of the steward's hand, and ordered the latter out of the caboose. He then seized the cook with his left hand by the throat, and dragged him out upon the deck. What occurred at this moment does not appear to have been exactly witnessed by any of the crew; but it is said that the captain made an attempt, with his knife, upon the cook's life. If, however, the attempt was made, it must have been unsuccessful, for the cook escaped without having received the slightest injury. There is no doubt, on the other hand, that the cook used his knife with a very effective and determined purpose; for scarcely had he been dragged upon deck when the captain fell dead at his feet from no less than nine deep stabs. The mate at once put the cook in irons, and brought the vessel back to Liverpool, where the prisoner, who is a native of the town, was handed over to the civil authorities, by whom he will be committed for trial.

Manchester.—A public funeral was given on Monday to the remains of Dr. Dalton, who died in Manchester a few days ago, aged 78. Dr. Dalton was a member of the Society of Friends, and was celebrated throughout Europe as a chemist, and as the discoverer of the "atomic theory." The Mayor and Corporation joined with his scientific friends in giving this public testimonial to his worth, and no less than 100 private carriages, including that of the Corporation, and the various societies in the town, formed a part of the procession to the Ardwick Cemetery, where his remains were interred. The shops and warehouses in the line of road were closed, and a marked desire was manifested by the inhabitants to pay every respect to the philosopher's memory.

Newcastle.—Notwithstanding the number of pitmen and their families ejected from the dwellings of their employers at the various collieries of this district, the strike yet remains in full force, and not the slightest prospect is afforded of the old pitmen resuming their employment. The commercial and trading interests are suffering most severely, and there never was a period in the history of Newcastle when so many acceptances, and to so large an amount, were held over at the different banking establishments, from the inability of the parties to withdraw them. The local papers also state that there are at this moment upwards of 50,000*l.* worth of silver lying unprofitably accumulated at the various banks, which, under ordinary circumstances, would have been employed in the payment of wages, and distributed weekly through the channels of trade and commerce in the district. There are upwards of 33,000 persons generally employed in the collieries of Northumberland and Durham, and of these only 2508 had resumed employment up to Saturday last; these had been joined by 3652 men, brought into the district from a distance; making a total of 6160 hewers at work, producing, on the average, 8310 chaldrons of coals per day. The coal-owners have already carried out the ejecting process to a considerable extent, but that seems to have failed in bringing the men to terms; and, in consequence, a general meeting of the owners was held in this town on Saturday, when it was determined that if the men did not resume work on or before Friday, the 16th, agents would be sent into the South of England, and elsewhere, where it had been ascertained that an abundance of miners could be obtained, to engage a sufficient number to supply the whole of the collieries.

Newcastle-under-Lyne.—On Sunday week a young man named William Cooper, son of a gamekeeper of Sir T. F. Boughey, Bart., and who was in the habit of assisting his father, when on his return from chapel, was shot dead on reaching the door of his father's house by some person lurking near. The police succeeded in discovering the footmarks of two persons near the spot, and traced them to Scot Hay, where they apprehended a young man called Powys, whose boots precisely corresponded with the smaller footmarks. They also apprehended a man called Downing, who had only been released from prison the day before the murder, after being imprisoned on the evidence of deceased's father for poaching. His boots corresponded exactly with the other footmarks. A gun was also found at Powys's house, which had been recently discharged, and both prisoners have been committed for trial.

Nottingham.—In our Assize Intelligence last week we briefly noticed the catastrophe which attended the execution of Saville the murderer, in this town on the 7th inst. The local papers state that it is impossible to give any adequate idea of the consternation produced in all classes by the occurrence. The crowd at the execution was immense: it was wonderful to see what countless thousands were packed on the pavement. As far as the eye could reach, nothing but the heads of men and women could be seen. Occasionally a cry was made that a man, woman, or youth, was fainting or being crushed to death, and if the individual were fortunate enough to have strength left, he was lifted up and allowed to walk to the extremity of the crowd on the heads of the people. Many hats were thrown about the heads of

the mob, which were destroyed, and great numbers had their clothes stripped off their backs, some of them being almost left naked. Soon after the criminal had dropped the immense crowd burst in the middle. The greater portion of them having been standing for hours were anxious to escape from their uncomfortable position, for the purpose of obtaining fresh air, and a great rush was made from the centre opposite to the drop; like a gun heavily charged and closely rammed, the explosion was tremendous. The greater portion of the doors of the houses in the streets were closed, and those were crushed by the immense body of human beings who had no means of escape. The effect of the crush was the most fatal near Garner's-hill, down which hundreds were hurled one on top of the other, the consequence of which was that 16 were killed, and more than 100 received serious injuries. Those who were looking out of the windows on each side of the street observed the rush, and foreseeing the consequences, screamed out to those behind to retreat. The Mayor was especially active; from one of his windows he put out a long lath, and waved it for those behind to retreat, and pocket handkerchiefs, &c. were waved as signals by others. It was all of no use. Although the Mayor almost threw himself out of his window for the purpose of staying the advance of the mob, very little heed appeared to be taken, and hundreds of individuals were thrown down, over whom the advancing crowd marched, without being able to help themselves. At the time of the occurrence the public seemed paralysed by astonishment. They had never seen such a thing before. After the first excitement was over, and the injured had been removed, the hospitals were besieged by those who had, or who fancied they had, lost their relations or friends. Parents and friends ran franticly to and fro, inquiring after those who were missing. It was some time before most of the dead and badly injured could be identified, and in the interim many were driven to distraction who had not the least cause for it. The inquest on the bodies concluded in the following verdict:—"The jury are of opinion that the deceased individuals were accidentally thrown down, in and by a crowd of people who had been attending a public execution in the town of Nottingham, and were then and there trampled to death, or suffocated; that the front of the county hall is a most improper place for a public execution, and the jury trust the persons who have the authority to fix upon a place for that purpose will not allow another execution to take place there." The foreman proposed to add to this verdict an expression of censure which was carried by a majority of two, in the following terms:—"A majority of the jury at the same time express their opinion that, considering the extensive excitement which prevailed, sufficient precaution was not taken by the proper authorities to prevent accident."

Portsmouth.—The Royal yacht Victoria and Albert has been fitted with new boilers and is now rapidly completing stores for service. The disagreeable effluvium which has ever been most annoyingly prevalent on board this fine vessel, has been totally removed by the application of Sir W. Burnett's patent preparation for the preservation of timber, &c. She will go out of harbour to try her new machinery in a day or two.

Romford.—The adjourned examination of Messrs. Johnson and Mann, of the late Romford Bank, took place before Mr. Commissioner Goulburn on Monday at the Court of Bankruptcy. Alderman Johnson in the course of a long examination admitted that he had drawn the customers' money to the amount of 10,000*l.* or 15,000*l.* out of the bank, and applied it to different purposes, but chiefly to pay off a bond given 30 years back, and with which his partner had no concern. He had drawn checks for 2700*l.* in the name of Johnson and Mann, the oil-firm in Whitechapel, and had dealt with several bills in the same manner, in order to increase his private credit, and without Mr. Mann's knowledge. He begged, however, for further time to give explanations of these matters. The banking business was begun without reference to the oil-trade, with a capital of about 22,000*l.*, of which he took 15,000*l.* in order to pay his bond above alluded to. In 1820 the capital in the oil-trade was 55,000*l.*, and the profits from 1819 to 1825 were upwards of 5000*l.* a-year, but he drew more out of the business than he ever put into it. Mr. Mann, on his examination, said he knew nothing of Alderman Johnson's proceedings, not even of the joint account opened at the bank. Mr. Johnson kept the cash and drew the checks. The assignees said that the opinion of the creditors as to the very improper conduct of Mr. Johnson remained just as it was before. They considered that he came down to Romford without the necessary capital to take up the high position of a banker, and as they still considered his conduct was unsatisfactory, they could not consent to his receiving an allowance. Mr. Commissioner Goulbourn did not think it necessary that the ground of refusal should be stated now; if the assignees refused, he could not interfere. The assignees said there was no objection to the continuance of Mr. Mann's allowance. The result of the examination was, that an adjournment was directed to take place till November, in order that in the interim the bankrupt's accounts should be fully gone into.

Wigan.—On Monday morning one of the most serious explosions that has occurred in this neighbourhood for many years took place at the canal pit of Messrs. Blundell and Sons, at Mesnes, attended with the loss of two lives. A report similar to the firing of a volley of artillery was heard in many parts of the town. The explosion was preceded by a violent hissing of the steam, immediately followed by the report, and a dense cloud of steam, dust, and smoke—the boiler in its ascent being torn to pieces; one piece was forced over a hedge into a field, a distance of 91 yards from its previous situation; another was thrown a distance of 68 yards; and another, which appeared the principal and largest piece, a distance of 50 yards. The steam-pipe, which connected the two boilers, was so firmly embedded in the ground that it could not without considerable difficulty be removed. The road leading to the colliery was literally strewed with bricks and other fragments. At the inquest the jury declared their opinion, that the accident arose from the employment of an incompetent engineer, whose services could be commanded at a low rate of wages. They then returned a verdict of Accidental Death, with a deodand upon the boiler and apparatus of 60*l.*

Windsor.—For some weeks past, H. R. H. Prince Albert has been actively engaged in superintending the manœuvres of his regiment, the 2d battalion of the Scots Fusilier Guards. His Royal Highness gives the word of command and puts the battalion through their various movements. The object of these exercises is said to have reference to the review which will take place on the arrival of the King of the French, when the Prince intends to appear before His Majesty at the head of his regiment.—A vacancy has been created on the foundation of the Military Knights of Windsor, by the decease of Major Anderson, K.G.H., late of the 10th Foot, who died in London on Friday last, in the 57th year of his age. The deceased, who had been engaged in active service, both in the East and West Indies, was buried at St. George's Chapel, with military honours.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3234*l.*; Bristol and Gloucester, 1002*l.*; Eastern Counties, 4765*l.*; Edinburgh and Glasgow, 2653*l.*; Great Western, 19,062*l.*; Grand Junction, 10,762*l.*; Glasgow, Paisley, and Ayr, 1627*l.*; Great North of England, 1982*l.*; London and Birmingham, 22,067*l.*; South Western, 10,289*l.*; Blackwall, 1393*l.*; Greenwich, 803*l.*; Brighton, 6121*l.*; Croydon, 548*l.*; Liverpool and Manchester, 5834*l.*; Manchester, Leeds, and Hull, associated, 7737*l.*; Midland, 11,932*l.*; Manchester and Birmingham, 3148*l.*; Newcastle and Carlisle, 1970*l.*; Newcastle and Darlington, 893*l.*; Preston and Wyre, 1115*l.*; South-Eastern and Dover, 6272*l.*; Sheffield and Manchester, 602*l.*; York and North Midland, with Leeds and Selby, 3105*l.*—The meeting of the London and Birmingham Company took place on Friday. The dividend declared was at the rate of 10 per cent. per annum, and the report stated that the gross produce of ordinary traffic for the half-year was 409,401*l.*, and the ordinary expenses 129,498*l.*, after deducting which, and making the necessary allowance for interest on borrowed capital, and the rent of the Aylesbury line, there was left, with the surplus of the last account, the sum of 258,685*l.* for division among the shareholders. The dividend will absorb 242,748*l.*, and then there remains 15,937*l.* to the credit of the next half-year's account. The Directors at this meeting were empowered to proceed with the Rugby, Stamford, and Stafford, the Worcester and Banbury, and Bedford lines, as they may deem fit, for the interest and security of the Company. At the close of the proceedings, a very handsome service of plate, and a purse of 2100*l.* were presented to Mr. Creed, the secretary, as a testimonial from 965 shareholders of the high esteem in which they hold his services of 14 years' duration.—The meeting of the London and Brighton Company took place on Friday. The report stated that an increase on the balance of net revenue, amounting to 10,215*l.*, had taken place during the half-year ending the 30th June. The amalgamation of the working stock with the Croydon and Dover Companies had taken effect since the 1st March last, but the result had not been sufficiently ascertained. Instead of the fixed sum paid to the Greenwich in lieu of toll, the Company will in future pay for 1st class passengers 4*d.*, for 2d class 3*d.*, and for 3d class 2*d.* Mortgage bonds at 5 per cent. to the amount of 41,450*l.* have been renewed at 4*l.* per cent. After considerable discussion, during which many objections to the report were raised, but satisfactorily explained, the report was adopted. Resolutions for purchasing an interest in the railways from Brighton to Hastings and to Chichester, and settling the terms on which the new shares for this purpose should be taken by the proprietors, were then proposed and carried. The dividend declared was at the rate of 12*s.* per share.—The London and Greenwich Company held their meeting on Tuesday, and the question of renewed negotiation with the South Eastern and Dover for a lease of the line on improved terms was discussed, and encouraged by a communication that the South Eastern Directors were inclined to give something more than the sum previously offered. It seemed to be the desire of the shareholders to have some sort of amalgamation with the South Eastern or other contiguous companies, which would insure a certain return for capital invested, though at the same time there was evidently a more harmonious spirit of co-operation among them to support their rights, and not immediately accept any terms that might be dictated. If no arrangement of a profitable character can be made with the South-Eastern or Croydon Boards, the new prospect of a North Kent line, with its consequent advantages, is regarded as another point on which the shareholders may rely for success; but, as it is believed that the South-Eastern Directors are disposed to enter into a modified agreement which will meet the Greenwich Directors half-way, the majority expressed an opinion in favour of coming to an equitable arrangement with that company, so as to avoid the probability of a further accumulation of debt. The result was the appointment of a committee of seven shareholders to act with the Directors in re-opening these negotiations, an adjournment of the meeting to a future day being made to receive a report on the subject. According to the report the receipts of the half-year were 23,416*l.* 9*s.* 7*d.*, an increase of 1871*l.* 19*s.* 4*d.*, compared with 1842; but there appeared also a very large increase in expenditure. The question of the payment of preference shareholders was referred to, but this and other matters were by general consent allowed to be suspended till the termination of the labours of the new committee is announced.—The York and North Midland, at their meeting last week, announced a dividend of 2*l.* 10*s.* per share on the 50*l.* shares, and a dividend of 1*l.* 4*s.* each on the 25*l.* shares. The total receipts of the half-year are stated to be 42,197*l.* 14*s.* 2*d.*, showing an increase of 2176*l.* 15*s.* 7*d.* upon the receipts of the same period last year. The expenses of working amounted to 15,679*l.* 18*s.* 7*d.*, and the interest on debentures to 4373*l.* 11*s.* 3*d.* An increase of nearly 500*l.* had taken place in the balance due from the Leeds and Selby. The contracts for the York and Scarborough line, as connected with Clifton, and thence to Falsgrave, had been let at a sum much below the engineer's estimate. Part of the land has already been purchased, and the works are said to have commenced.—The Newcastle and Darlington, at their meeting, carried their present limited amount of profits to the next half-year's account. Considering the pitmen's strike, and the short time the line has been opened, the directors express themselves perfectly satisfied with the progress of affairs. The accounts of all contractors have been closed, and the arrangements completed for the purchase of the Durham Junction. The Newcastle and Berwick line will cost 760,000*l.*, and the capital is to be raised by the issue of 28,000 shares of 25*l.* each, the preference being given to shareholders in the Newcastle and Darlington.—The Pontop and South Shields Company, at their meeting on Saturday, also announced that their line had been affected by the strike of the pitmen, and the depression of business consequent on it at Newcastle. Before the strike the profits had gone on increasing to the extent of 1130*l.* The total receipts for the half-year were 29,554*l.* 12*s.* 9*d.*, and the expenditure 21,483*l.* 12*s.* 6*d.*, leaving a balance of 8071*l.* 0*s.* 3*d.* The directors declared a dividend of 1*l.* 4*s.* per share, equal to 4 per cent. on the paid-up capital.—The cheap pleasure trips are becoming of more importance to the public no less than to the railways, in proportion as they are better understood. The Halifax papers mention a charitable trip as now in progress, by which sets of tickets of 40 for 1*l.* will be offered to the clergy and benevolent persons for distribution among really poor and aged persons who are not able to pay for themselves, and who will be conveyed to Fleetwood and back on an early Monday, when there will be a good mid-day tide. Thus many who seldom see beyond their own cellars, or their own street-ends, will be favoured with the sight of this rising town, enjoy the pleasure of the fresh air, view the Fylde, and bath in the salt water.—The London and Birmingham Company have also projected a journey to Liverpool from London by rail, on the 19th inst., and from Liverpool back to London on the 29th, in order to give travellers an opportunity of visiting Scotland, Ireland, Wales, the Lakes, and the Isle of Man.—On the South-Eastern, on Sunday evening, a train was dispatched from Dover to London, consisting of 40 carriages, which were all crammed with passengers, consisting principally of persons who had availed themselves of excursion tickets, and who reached Dover by the trains on Saturday and Sunday mornings. Four engines were used, and the passengers amounted to at least 1400.—On Sunday an excursion train to Brighton and back (being the first of a series of four), left London with 33 carriages and about 1000 persons, arriving at Brighton in time to enjoy the day there, returning in the evening to London.—The Directors of the South Western Railway have received a letter from the Secretary of the Royal Agricultural Society of England, stating, that at a general meeting of the society, on the 26th ult., at which Earl Spencer presided, it was moved by the Duke of Richmond, and seconded by Mr. Shelley, that the best thanks of the society be given to the Chairman and Directors of the Company for the facilities they had afforded, by their excellent arrangements, in the conveyance of passengers and stock to and from Southampton, on the occasion of the society's recent meeting, and for the liberality they had evinced in the reduction of their charges in favour of the exhibitors.—We lately noticed the arrangements made for completing the mail communication between this country and Belgium. We have now to state that the journey from London to Brussels can be accomplished regularly in one day. The arrangements for this object commenced on Sunday last. The train left London for Dover at half-past 5, A.M., arrived at Dover at 9; the embarkation on board the Princess Mary, belonging to the Dover Company, took place immediately; and the voyage to Ostend was performed in little more than four hours and a half. The passengers left Ostend at a quarter past 4, and arrived in Brussels at a quarter past 9 the same evening, the whole distance (238 miles) having been accomplished in 15¼ hours. The stoppage in Ostend exceeded two hours.

IRELAND.

Dublin.—The usual meeting of the Repeal Association was held on Monday, Mr. R. O'Gorman in the chair. Mr. S. O'Brien commenced the business of the day by handing in remittances. Mr. D. O'Connell, jun., acknowledged the receipt of several remittances, and then said he had to make his usual weekly return from the prison.

He was happy to inform the Association that the imprisoned martyrs were in good health and excellent spirits, enjoying the perfect tranquillity of Ireland throughout its entire extent. They were likewise rejoiced to find that the spirit of perseverance, in looking by legal and constitutional means for the repeal of the Union, still pervaded Irishmen of every class and persuasion. Peace and perseverance, and the Union would necessarily be repealed. He could state to the Association, of his own knowledge, that when the account reached Mr. O'Connell, of the speech made by Mr. Sheil on the subject of the State Trials, he expressed his regret that any such speech should have been delivered—a regret not unmixed with some indignation. Mr. O'Connell totally disavowed and repudiated the matter of that speech; he thought it a highly unbecoming one as proceeding from any friend of his, and he considered it anything but a friendly act on the part of Mr. Sheil. He could also state that as Mr. O'Connell, at the close of the proceedings in the Queen's Bench, solemnly protested against the injustice done to him, he continued firm in that protest. There had never been upon his part, and there never would be, any shrinking or compromise, and he could not consider any man his friend who talked of compromise or shrinking. Mr. O'Connell had now, and long had had, but one political object, the restoration of the domestic legislature of Ireland—a restoration which, in his judgment, was merely a question of time. Come it should—the only question was when. He deemed the period not distant; he desired to be at large only that he might the more actively pursue all peaceable and legal means to restore the native legislature of Ireland; he did hope, as he did anxiously wish, that his imprisonment might arouse every patriot who is out of prison to increased peaceable exertion for the repeal of the Union. It was the duty of those who were at large to redouble their efforts for the repeal of the legislative Union. There had been an assertion attributed to Sir R. Peel, by the public papers, to the effect that the Government had intended to issue a proclamation against the holding of the two meetings prior to that of Clontarf, but that the meetings were abandoned. He had made inquiry, and he could now state to the Association, that if Sir R. Peel made any such assertion, he did so upon false information, the assertion being in itself perfectly untrue, as there were no meetings agreed to be held, and then given up, prior to the Clontarf proclamation. The falsehood of the assertion, of course, is not attributed to Sir R. Peel, but to the base men who misinformed him. The assertion, however, itself was perfectly false. He then adverted to the municipal elections, and expressed a hope, on the part of Mr. O'Connell, that the burgesses would pay their taxes, and qualify at once. Mr. Powell, M.P., moved an address to Her Majesty, praying for the restoration of the Irish Parliament. Mr. H. Grattan, M.P., seconded the motion in an emphatic speech, and on concluding was loudly cheered. Mr. S. O'Brien mentioned that the number of signatures to the document amounted to 1,084,988; and he had to announce that a large proportion of these came from the northern counties. On the motion of Mr. M'Nevin, seconded by Mr. Mackay, a committee was appointed to inquire into the facts of the recent disturbance in Cork, which had arisen out of a religious cause. Mr. O'Connell concurred in the propriety of this step, and expressed his conviction that the statements respecting this affair had been greatly exaggerated. After some farther business had been gone through, Mr. S. O'Brien announced the rent for the week to be 946*l.* 17*s.*—The Duke of Devonshire sailed in the mail packet for Liverpool on Wednesday week from Kingstown. The Duke was accompanied by one of his English agents; and Mr. Paxton, his head gardener at Chatsworth, formed one of his suite.—There is a rumour in Dublin that Her Majesty and Prince Albert intend to visit Ireland during the present autumn.

Limerick.—At the triennial visitation, in Limerick Cathedral, on Saturday, Dr. Whately, Archbishop of Dublin, directed that a reading-desk, moved convenient to a communion table, should be restored to its former place, as his Grace was against even the appearance of innovation in the interior economy of the church, which might be supposed to savour of Tractarian or Puseyite discipline.—At the Limerick petty sessions on Friday, Mary Regan, whose husband was convicted at the last assizes of conspiracy and arson on Lord Dunraven's demesne at Adare, and sentenced to transportation for life, was brought forward by her parents, who represented to the bench that it was her intention to commit a similar outrage, in order to be sent out of the country with her husband. The recorder inquired if she would like to be sent to America, and she replied in the affirmative. He then promised to use his influence to have her passage secured, and she was set at liberty on undertaking to keep the peace.

Law.

Summer Assizes.—Northern Circuit.—Carlisle.—*Post Office Robbery.—John Nicholson*, a young man respectably connected, the brother of a hosier at Carlisle, and of Mr. W. Nicholson, warehouseman, in Milk-street, Cheapside, was indicted for having, while employed as clerk in the Post-office at Carlisle, embezzled a post letter containing 30*l.*, directed to Mr. Smeals, at Glasgow. It was proved that the letter containing the money had never reached its destination, and one of the notes had been traced as having been paid to a firm in the city by the prisoner's brother. This brother proved that he received it from the prisoner on account of their brother at Carlisle. The prisoner gave an unsatisfactory account of his possession of the note, and on searching his room, a coat was found containing in the pocket the original letter addressed to Mr. Smeals, of Glasgow, from which the money had been abstracted. The prisoner was found guilty, and sentenced to transportation for 10 years.

Midland Circuit, Warwick.—*William Stanley Warner*, who was committed a few days ago from Birmingham to Warwick Gaol for having stolen 1200*l.* from the District Banking Company, was brought up on Friday before Mr. Justice Coltman, and pleaded guilty. Mr. Miller made a powerful appeal to the Bench in his behalf, but his Lordship said it was indispensably necessary to visit with a severe sentence the prisoner, who had been a confidential servant. For such a person there was the least possible excuse. He ordered him to be transported for 14 years.

Western Circuit, Wells.—*Joel Fisher*, formerly a private in the Dragoons, was indicted for the wilful murder of his wife, at Weston super Mare. It appeared from the evidence that deceased and the prisoner lived very unhappily together, and that the wife was a violent woman, constantly resorting to all kinds of arts to annoy the prisoner. On the 5th June, after a violent altercation, prisoner killed her by knocking her on the head with a crowbar, and afterwards cutting her throat. For the defence it was urged that the provocation received reduced the crime to manslaughter, and that the prisoner was insane. This plea, however, failed, and the jury returned a verdict of Guilty. Upon the prisoner being asked why judgment should not be pronounced against him, he said that he had killed her, and was justified in doing so, as she was such a bad and provoking woman, that he would rather be hanged than have lived with her. His Lordship then proceeded to pass on the unhappy man sentence of death, which he heard unmoved, and was led from the dock urging excuses for his crime.—In the course of a trial of two men, before Mr. Justice Pattison, for stealing, a girl 14 years of age was tendered as a witness in behalf of the prisoners. She was objected to on the part of the prosecution, as not understanding the nature of an oath. On this the Judge proceeded to question her. She stated that she lived at Chenstock, which is a parish between this place and Bristol. She had never been to school. Had not learned to read or write. Had never been in chapel or church, or received the least religious education beyond this, that she had sometimes said her prayers to her mother. But she did not know where those went who told lies and perjured themselves. Knew nothing about heaven or hell, and had never heard there was a God. Of course her evidence was rejected. The learned Judge, in summing up, said it was truly awful to find that, in a country like this, and in a part of it where there were, comparatively speaking, but few inhabitants, a girl like the witness should be so neglected as to be obliged to confess that she had never heard of a God.

Police—Thames Office.—After the unusually long remand of six weeks, *Mr. C. Belaney*, the surgeon, was brought before Mr. Broderip last week, for final examination, charged with the wilful murder of Rachael Belaney, his wife, by administering to her a quantity of prussic acid, at Stepney, on the 8th June last. The Crown Solicitor, who attended to prosecute, said he did not wish to offer further evidence, but prayed that the prisoner might be committed for trial. After an attempt on the part of prisoner's counsel to obtain permission for him to remain in Clerkenwell prison, the magistrate committed him to Newgate on the charge of wilful murder.

SPORTING.

Tattersall's, Thursday.—*St. Leger.*—500 even on the field agst Scott's lot (field for choice); 3 to 1 agst Mr. Salvin's The Cure (taken to 50*l.* and aft off); 4 to 1 agst Lord Stanley's Ithuriel (9 to 2 taken); 15 to 2 agst Mr. J. Scott's Bay Momus; 8 to 1 agst Mr. Vane's Valerian (taken to 50*l.*); 10 to 1 agst Duke of Richmond's Red Deer (taken and aft off); 13 to 1 agst Col. Anson's The Princess (taken to about 200*l.*); 15 to 1 agst Mr. Irwin's Foig-a-ballagh (taken and aft off); 15 to 1 agst Mr. J. Day's The Ugly Buck (taken and aft off); 35 to 1 agst Mr. J. Hampson's Lightning (taken). To the above it is only necessary to add that Ithuriel and the Princess were in considerable demand; and that although the prices quoted against the Cure, Red Deer, Foig-a-ballagh, and the Ugly Buck, were taken to a small amount, the disposition to lay against them (the Ugly Buck in particular) was general. Business, on the whole, was excessively dull.—*Derby.*—17 to 1 agst Col. Peel's Cobweb colt (taken and aft off); 25 to 1 agst Mr. Forth's lot (taken); 33 to 1 agst Mr. S. Stanley's Minikin colt (taken); 33 to 1 agst Mr. Winteringham's Rebecca colt (taken); 35 to 1 agst Mr. Mostyn's the Black Prince (taken); 40 to 1 agst Mr. Ferguson's Clear-the-way (taken).

Carver, Esq., of Camden-town, Middlesex, aged 79—10th inst., at Heveningham-hall, Suffolk, Joshua, Lord Huntingfield, of the peerage of Ireland, aged 66—10th inst., at Clapham-common, J. Hudson, wife of R. Hudson, Esq., aged 32—10th inst., at Camden Town, S. M. Abington, eldest surviving sister of the late William Abington, Esq., of the East India House, aged 76—10th inst., in Guilford-street, Elizabeth Mayow, wife of P. W. Mayow, Esq., aged 65—11th inst., at Rochester, on his return from the Continent to Ireland, of consumption, Richard, Lord Viscount Powerscourt, aged 29—12th inst., at Hall-place, the seat of Sir E. C. East, Bart., J. J. W. Peyton, Esq., of Wakehurst-place, Sussex, and late of the 2d Life Guards, aged 26—12th inst., at 24, Torrington-square, Henry White, Esq., B.C.L., of Trinity College, Cambridge, youngest son of J. White, Esq., aged 27—12th inst., at his residence, Camberwell-grove, S. Butler, Esq., aged 82—14th inst., at his residence, Charlotte-street, Bloomsbury, the Rev. H. F. Cary, well known as the translator of Dante, aged 72.

EXTIRPATION OF THE MEALY-BUG, THRIPS, AMERICAN BLIGHT, &c.—A Practical Gardener, Author of a Work on Blight, is in possession of receipts by which he can effectually extirpate the above pests to Gardens at a trifling cost, and without the prolonged and injurious processes hitherto practised.—Address, prepaid, S. Hereman, Romsey, Hants.

PRICE'S PATENT CANDLES, are retailed by most of the respectable Dealers throughout the Kingdom at 1*s.* per lb., at which price they are cheaper, taking into account the quantity of light given, than the commonest Tallow Dips. They are beautifully white, and burn without snuffing more brilliantly than the finest wax.

The Trade may obtain them wholesale from Edward Price and Co., Belmont, Vauxhall; or from Palmer and Co., Sutton-street, Clerkenwell.

EXTRACT FROM OLD MOORE'S ALMANAC for 1844.—"AUGUST.—CARE OF HEALTH.—This is generally the hottest month in the year; languor and inability for active mental and bodily exertion is experienced by all, but more especially by ladies and those of delicate constitution. Recourse should be had to that excellent medicine, Parr's Life Pills, which will quite re-invigorate the whole system, and render the heat of this month, which is otherwise so oppressive, as delightful as any month in the year."

PARR'S LIFE PILLS are sold by all respectable Medicine Venders.

See the words "Parr's Life Pills," in White Letters on a Red Ground on the Government Stamp.

DRESS AND FROCK COATS.—Superfine Cloth Dress Coats, 30*s.* to 35*s.*; Extra Quality, 40*s.* to 50*s.*; Frock Coats, with Silk facing, 35*s.* to 42*s.*; with Silk Velvet Collar and Silk facing, 50*s.*; Waterproof Chesterfield, Codrington, and Travelling Coats, 12*s.*, 15*s.*, and 21*s.*; Waistcoats, 5*s.* 6*d.* to 8*s.* 6*d.*; rich Satin, Silk and Cassimere, 8*s.* 6*d.* to 12*s.* 6*d.*; Trowsers, 6*s.* 6*d.* to 10*s.* 6*d.*; Doeskin and Kerseymere, 12*s.* 6*d.* to 21*s.*; Shooting Jackets, 10*s.* 6*d.*, Boys' and Youths' Cloth, Hussar Suits, 21*s.* to 30*s.* A Suit of Superfine Black Cloth, 3*l.*; Extra Quality, 3*l.* 10*s.* to 4*l.* At Fisher & Co.'s, Tailors, 31, King William street, City, ten doors from London-bridge.

AT No. 9, CHARLOTTE-STREET, BLOOMSBURY, and at no other place in the world, can MIND or NERVOUS COMPLAINTS be CURED. Here, and by the means of cure and advice that can be sent to all parts, every person can be perfectly cured who is suffering from depression of spirits, determination of blood to the head, groundless fear and suspicion, loss of memory, irresolution, indecision, incapacity for study and business, sleeplessness, wretchedness, delusion, melancholy, thoughts of self-destruction, &c. Most recover in six weeks. Apply to, or address, post-paid, Rev. Dr. Willis Moseley. At home from 11 to 3.

AGRICULTURAL COLLEGE.

WANTED, for the Superintendence of an Agricultural College, a HEAD MASTER, who must be perfectly conversant with the cultivation of Land and the management of Stock on the most improved principles; he must also have a competent knowledge of the Sciences connected with Agriculture.—Direct to Robt. J. Brown, Hon. Sec., Cirencester.

WANT PLACES.—All Letters to be post-paid.

TO NOBLEMEN AND GENTLEMEN.

AS HEAD GARDENER, a married Man, aged 36; has a thorough knowledge of his profession in all its branches, from varied experience in situations of distinction in Scotland and England, in the most improved principles of Horticulture, in Fruits and Exotic Flowers; and has had great experience in laying-out Pleasure-grounds, Flower-gardens, and Ornamental Plantations, &c.; is conversant with accounts, and has no objection to act as Forester or Bailiff; and can produce testimonials of character and ability from several Curators and esteemed Gardeners, and from the Noblemen and Gentlemen he has served, which will stand the strictest investigation.—Direct, P. Q., Mr. Cameron's, Curator, Botanic Garden, Birmingham.

AS FOREMAN under a Nobleman's Gardener.—A respectable steady single Man, age 24, understands the management of Pines, Vines, Kitchen and Flower-Gardening; can have a 4 years' character from the gardener he has left.—Direct to A. H., 32, Cochrane-terrace, Portland-town, London.

AS GARDENER.—A married Man, aged 34, a native of Scotland, who is perfectly acquainted with Horticulture and Floriculture on the most improved principles, practised in the neighbourhood of London. He can be well recommended by a Nobleman with whom he lived about four years and a-half.—Direct to A. W., at Messrs. Ronald's Nursery, New Brentford, Middlesex.

AS GARDENER.—A respectable middle-aged Married Man, without incumbrance, who perfectly understands his profession in all its various branches; he is about to leave his present situation in consequence of his employer going abroad, from whom he can have an unexceptionable character, having lived with him 8 years.—Direct to T. Gadd, at J. Boasor's, Esq., Polesden, Leatherhead, Surrey.

AS GARDENER.—A married Man, without incumbrance, a native of Scotland, aged 34; is well acquainted with the cultivation of Pines, Grapes, Melons, and Cucumbers, upon the most improved principles, and has had extensive practice in the Flower-forcing department, as well as a thorough knowledge of Kitchen and Flower-Gardening. Highly respectable reference can be given as to character and ability.—Direct to A. M. G., at Mr. Glendinning's Nursery, Chiswick.

AS GARDENER.—Samuel Hereman, Author of "Blight on Flowers," late Gardener, Forester, &c. to the Right Hon. Lord Viscount Palmerston, at Broadlands, is just disengaged from that nobleman, and is now at liberty to form another engagement; he is 42 years of age, a married man, with three children, and can have a satisfactory character from his lordship.—Direct to S. Hereman, Romsey, Hants.

AS GARDENER.—A Married Man, without a family, 34 years of age, who has a practical knowledge of his business in its various branches, including the management of Plants, Flower and Kitchen Garden, Vines, Forcing, &c.—Direct to C. H., Post-office, Wandsworth, Surrey.

AS GARDENER.—A Married Man, aged 30, with one child. He can be highly recommended, and perfectly understands Forcing, Kitchen and Flower Garden, Greenhouse, and Wall Trees. No objection to a single-handed place. Distance no object. Direct J. L., Mr. J. Pamplin, Nurseryman, Walthamstow, Essex.

TO NURSERY AND SEEDSMEN.

AS CLERK or SHOPMAN, a young Man, aged 21, who writes an expeditious hand, and has been seven years in the business; can have the most unexceptionable testimonials as to character and ability.—Direct to O. P., 9, Great Russell-st., Covent Garden.

TO LANDED PROPRIETORS AND AGRICULTURISTS.

AS FARM-STEWARD.—The Advertiser is a native of Scotland, 30 years of age, and unmarried; brought up to Farming from his youth; is desirous of obtaining a situation as above—having been employed in the management of Cattle and Sheep, as also in Land Draining of the latest and most approved system, Road-making and Fencing to a considerable extent, on estates of Noblemen and Gentlemen in England and Scotland, where he can with confidence rely as to ability and character.—Direct to A. P., care of Mr. William Skirving, Nursery and Seedsman, Queen-square, Liverpool.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

Horticultural Societies, local	573 *b*		

RAY SOCIETY, instituted 2nd February, 1844.—This Society has been formed upon the principle of the Parker, Camden, Sydenham, and other Societies, for the purpose of securing to those attached to the study of Natural History, such Works on the various branches of Zoology and Botany as could not be obtained by other means; and will consist of original works; of new editions of works of established merit; of rare tracts and MSS.; and of translations and reprints of foreign works. Every subscriber of one guinea annually will be considered a member of the Society, and will be entitled to a copy of every work published by the Society. The Council have great pleasure in stating that the number of Members already exceeds 300, and beg to call the attention of their friends to the necessity of sending in their names as early as possible, in order that they may be enabled to determine the number of copies of their works which they ought to print. The Council hope to publish two volumes before Christmas, the first of which will consist of translations from the German and Italian, of Reports on the progress of Zoology and Botany during the last few years.

Communications on the business of the Society are requested to be addressed to the Secretaries, Dr. George Johnston, Berwick-upon-Tweed, and Dr. Lankester, Golden-square, London. Subscriptions to be sent, by post-office order or check, to the Treasurer, J. S. Bowerbank, Esq., 45, Park-street, Islington.

GEORGE JOHNSTONE, M.D.
EDWIN LANKESTER, M.D. } Secretaries.

INGA PULCHERRIMA. (Figured in "Paxton's Magazine of Botany" for August, 1844.)—Fine Plants of this extremely elegant and beautiful Exotic, with most of the other new and rare Plants of the season, may be obtained of the undersigned, at the following low prices:—

Inga pulcherrima, 7*s.* 6*d.*
Achimenes picta, 10*s.* 6*d.*
Æschynanthus Horsfieldii, 7*s* 6*d*
Amycia zygomeris, 7*s.* 6*d.*
Clerodendron splendens, 10*s.* 6*d*
" squamatum, 5*s.*
Hindsia, or Rondeletia longiflora, 15*s.*
Epacris campanulata rosea (the finest selected from 1000 seedlings), 7*s.* 6*d.*
Habrothamnus elegans, 15*s.*
Tremandra Hugelii, 10*s.* 6*d.* to 21*s.*
Veronica speciosa, 5*s.* to 15*s.*
Erica elegans, fine and healthy, 15*s.*, 24*s.*, and 30*s.* per doz.
Drymonia punctata, 3*s.* 6*d.*
Phlox Van Houttei, (flowering plants), 2*s.*
Spirea Reevesiana, 5*s.*
Viburnum cotonifolium, 3*s.* 6*d.*

Also the following, in collections:

100 Cape Ericas of 100 distinct sorts, (including many fine sorts) 5*l.*
12 Epacrises of 12 distinct sorts, (including Campanulata rosea) 21*s.*
12 Azalea indica, of 12 distinct sorts, (including fulgens) 21*s.*

THOMAS JACKSON, Kingston Nursery, Surrey, August 23.

MESSRS. J. AND H. BROWN are now sending out to any part of the Kingdom the following very desirable plants:—

The beautiful new Lilium lancifolium album and punctatum, flowering plants, 3*s.* 6*d.* and 5*s.* each; very strong plants, 25*s.* each; good bulbs that will bloom next season, 18*s.* and 24*s.* per dozen.
Lilium venustum, sanguineum, longiflorum, and eximium, 12*s.* per dozen.
Chrysanthemums, newest and best varieties, 9*s.* p. doz., sent post-free.
The best new Fuchsias of 1844, 18*s.* per dozen; other approved kinds, 6*s.* and 9*s.* per dozen.
Bouvardias, 4 varieties, 6*s.* per doz.; strigosa, 5*s.* each.
12 varieties of Tea-scented Roses, 9*s.* per doz.
Yellow Noisette, Yellow and White China, 9*s.* per doz.
Fine new buff Rose, Eliza Sauvage, 18*s.* per doz.
New crimson odorata, 12*s.* per dozen.
Fine new Rose, Le Pectole, pale primrose, 2*s.* each, or 20*s.* per dozen.
Queen of the Bourbons, a beautiful Rose, 2*s.* each, or 20*s.* per dozen.
All these Roses—or established in small pots—could be shaken out and sent by post.
The new Achimenes picta, 7*s.* 6*d.*; hirsuta, 1*s.* 6*d.* each.
The dwarf orange Brugmansia, flowering plants, 3*s.* 6*d.*
Pentas carnea, 3*s.* 6*d.*; Veronica speciosa, 3*s.* 6*d.* each.
Gesnera tubiflora, fine new white, 2*s.* 6*d.* each.
Inga pulcherrima, 5*s.* each.
Niphæa oblonga, 2*s.* each.
Centradenia rosea, 2*s.* each.
Albion Nursery, Stoke Newington, London.

NEW AND RARE PLANTS.

W. JACKSON AND CO., NURSERYMEN, SEEDSMEN, and FLORISTS, have now the pleasure to offer the following Novelties:—

Cineraria Celestial, No. 1. . . . . 5*s.* each.
" Fairy, No. 2. . . . . 5*s.* "

See Dr. LINDLEY's opinion in the *Gardeners' Chronicle*, of April 6, page 216, under the letters, C. L. N. "Seedling No. 1, a bright blue. The flowers of this variety are rather small, but they are very abundant, and bright and beautiful in colour. No. 2, pure white centre, with the termination of the petals of a delicate azure blue. This is also an abundant bloomer with well-formed flowers, lively in appearance, and forms a distinct and desirable variety." Discount to the Trade on the above when six plants of each are ordered.

Boronia ledifolia, 5*s.*; Chorozema triangularis, 5*s.*; Epiphyllum, Conway's Giant, 3*s.* 6*d.* to 5*s.*; large E. Russellianum, 2*s.* 6*d.*; Gastrolobium spinosum, 5*s.*; Gompholobium polymorphum luteum, 5*s.*; Hydrangea Japonica, 2*s.* 6*d.*; Mirbelia speciosa, (Loddiges') 5*s.*; Oxylobium acutum, 5*s.*; Pimelea spectabilis, 2*s.* 6*d.*; Thunbergia chrysops, 7*s.* 6*d.*; Veronica speciosa, 2*s.* 6*d.* to 7*s.* 6*d.* each, large.

W. JACKSON and Co. beg to state that their 60 beautiful Seedling Calceolarias, selected from upwards of 2000, will be sent out early next Spring, a descriptive Catalogue of which will be printed. Railway communication to all parts of the kingdom. A reference from unknown correspondents is respectfully solicited.—Cross-lanes Nursery, Bedale, Yorkshire.

TO THE LOVERS OF PANSIES.

S. WIDNALL, Grantchester Nursery, Cambridge, begs to inform his friends and the public that he has with great care selected his Superior PANSY-SEED, warranted to be all new of the present year, and which he can with confidence recommend. This being a favourable season for sowing, it will be advantageous to those who wish to ornament their gardens with this beautiful flower at a very cheap rate, as packets containing sufficient seed, with careful cultivation, to grow 500 plants and upwards may be had postage free at 2*s.* 6*d.* per pckt., or three packets for 6*s.*, upon receiving a post-office order.

VALUABLE NEW PLANTS.—The following are confidently recommended as being infinitely the most beautiful of their respective tribes, and worthy a place in all choice collections:—

Achimenes picta, 7*s.* 6*d.* to 15*s.* each; Gloxinia cartonii, 5*s.* to 10*s.* 6*d.* do.; Cereus carnata, 3*s.* 6*d.* do. The Subscribers feel so confident of this Plant giving entire satisfaction, that they are willing to engage to return the money to all who are not pleased with them. They have also now to offer 12 Plants of choicest kinds of Geraniums, including Duke of Cornwall, Sunrise, Fair Maid of Devon, Lord Ebrington, and others equally good, for 21*s.* the 12, or 2*s.* 6*d.* each. 12 most splendid new kinds of Verbena, 6*s.* 12 choicest Fuchsias in cultivation, 10*s.* 6*d.*, sent free by post.—R. WHITE and Co., Poole Nursery, Dorsetshire.

THOS. CRIPPS respectfully offers the following New FUCHSIAS at 24*s.* per dozen, reserving the selection to himself; or 30*s.* per dozen if selected by the purchaser, viz.:—Marnock's Princess Sophia, Sidmouthii, Pullen's Adonis, Pondii, Stormontii, Le Chinois, Audot, Queen, Magnet, Pawley's Prince of Wales, Kentish Bride, Duke of Wellington, Bridegroom, Transparens (Oudin's), Akhbar Khan, Sanguinivea, Cylindrica Superba, London Rival, Edwardsii, Victorine, Queen Adelaide (Holmes's). A splendid collection of older kinds at 12*s.* per dozen.

Also the following select plants, viz.:—Achimenes picta, 10*s.* 6*d.*; Habrothamnus fascicularis, 3*s.* 6*d.*; Gloxinia rosea alba, 5*s.*; Thunbergia chrysops, 10*s.* 6*d.*; Brugmansia Knightii (new double white), 5*s.*; Brugmansia floribunda, 5*s.*; Statice pseudo armeria, 3*s.* 6*d.*; Mimulus Moodieana (fine), 2*s.* 6*d.*; Mimulus Colen (the finest scarlet yet out), 3*s.* 6*d.*; Hydrangea japonica, 2*s.* 6*d.*; Ribes albidum, 3*s.* 6*d.*; Veronica speciosa, 5*s.* A remittance or respectable reference accompanied with the order is respectfully requested.

Tunbridge Wells Nursery.

PINE PLANTS.—Persons in want of the above have an opportunity of choosing from a particularly strong and healthy stock, warranted clean, at moderate prices. Apply personally or per post to W. DAVIS, Green-street, Marlboro'-road, Chelsea.

T. AND J. BACKHOUSE, NURSERY & SEEDSMEN, York, beg to offer to the public strong plants of the following new and rare species:—Achimenes picta, 10*s.* 6*d.*; Aristolochia gigas, 10*s.* 6*d.*; Lisianthus nigrescens, (small) 2*s.* 6*d.*

T. and J. B. have also a good stock of Lisianthus Russellianus, Phlox picta, Van Houttei and bicolor, 1*s.* 6*d.* each; Achimenes hirsuta, 2*s.* 6*d.*; and Pentstemon Murrayana, 2*s.* 6*d.*

AURICULA SEED from Stage Flowers, to be had in Packets at 2*s.* 6*d.*, of W. J. NUTTING, Seedsman, 46, Cheapside, London.

NEW PANSY SEED.

WILLIAM CLARK, 25, Bishopsgate-street-within, London, is now sending out Seed just gathered, warranted from the best Flowers, and can confidently recommend the same, knowing the kinds collected from; in papers of 2*s.* 6*d.* and 5*s.* each. Also, J. H. Cox, Esq.'s, superb PICOTEE SEED, 5*s.* per paper. Very fine CALCEOLARIA, from the first flowers, 1*s.* and 2*s.* per paper. CINERARIA, from 12 best varieties, 1*s.* per paper. GERANIUM, fine mixed, 1*s.* per paper. May be had on receipt of a post-office order.

EARLIEST STRAWBERRY in CULTIVATION.—Strong Plants of the "PRINCESS ALICE MAUDE" STRAWBERRY, which has proved itself to be the earliest grown in this country, are now ready to be sent out at 3*s.* per 100. As an Early Strawberry, it has taken the First Prize at all the Horticultural Exhibitions in the early part of the season. Also Plants of the "British Queen," "Deptford Pine," "Prince Albert," and all the leading kinds. To be had of Messrs. WARNER & WARNER, Seedsmen, 28, Cornhill, London.

DUTCH HYACINTHS AND OTHER FLOWER ROOTS.—The undermentioned has received, per Rotterdam Steamer, "Emerald Isle," in FINE CONDITION, an assortment of the above. Early orders for which will secure Good Roots, and upon terms equal to any other Dealer.

T. D. WATKINSON, Seedsman, 6, Market Place, Manchester.

MR. HOYLE'S NEW SEEDLING GERANIUMS.

WILLIAM MILLER respectfully announces to the Nobility, Gentry, Amateurs, and the Trade, that he has purchased the entire stock of the following superb SEEDLING GERANIUMS raised by G. W. HOYLE, Esq., of Guernsey, viz.:

1844. each.—	£	*s.*	*d.*
Titus	3	3	0
Pompey	3	3	0
Champion	2	2	0
These three for six guineas.			
1843.			
Unique	1	1	0
Queen of England	1	1	0

Claude . each.—	£	*s.*	*d.*
Sarah Jane	1	1	0
Amelia	0	10	6
Majestica	0	10	6
Rosalia	0	10	6
Flora	0	10	6
General Pollock	0	10	6
These nine for five guineas.			

The entire set 10 guineas, with a discount of 20 per cent. to the Trade. A remittance must accompany the order from unknown correspondents.

Titus received a seedling prize at Chiswick, June, 1844; Pompey, Champion, and Unique were pronounced by Professor LINDLEY, in the *Gardeners' Chronicle* of June 29, 1844, to be "three flowers of good substance, size, and variety;" and Mr. Glenny, in *Gardeners' Gazette* June 22, 1844, says, speaking of the Geraniums at the Chiswick Fête—"Mr. Hoyle had by far the best lot there; Pompey was the best of them, and Titus next." Blooms of the others were likewise exhibited at the June Fête, Chiswick, 1844, and attracted very extraordinary attention, and were universally admired. On the whole, the above varieties, for substance, roundness of form, and general excellent qualities, are among the best ever offered to floriculturists. Printed Lists, with full descriptions, can be had on application. To commence sending out plants in October.

W. M. has been supplied by Mr. Hoyle with some choice GERANIUM SEED, which he saved from his own beautiful Seedlings, and the newest and best varieties sent out by other growers. Sealed packets of 100 seeds, 12*s.*; do. of 50 seeds, 7*s.* Also, Hybridised Seed, saved from his own extensive collection of Pelargoniums; packets of 100 seeds, 10*s.*; of 50 seeds, 5*s.*

Providence Nursery, Ramsgate.

T. DAVIES and Co. beg to offer, at very reduced prices, the following plants, of which they possess a fine healthy stock:—

	£	*s.*	*d.*
Auracaria imbricata, 3 to 5 in. high, per 100	4	4	0
Rose Cloth of Gold, per plant	0	5	0
Habrothamnus fasciculatis	0	3	6
Hydrangea japonica	0	2	6
Epacris coccinea	0	5	0
Ilex latifolia, from 15*s.* to	1	10	0
Berberis tenuifolia, 10*s.* 6*d.* to	1	1	0
Primula sinensis alba pleno, 3*s.* 6*d.* to	0	7	6
Camellias of almost every kind in cultivation, from 2*s.* 6*d.* to	0	5	0

T. D. and Co. can also supply the following SEEDS, which have been collected by them with the greatest possible care:—

GERANIUM.—Positively gathered from their Show-Plants, which have gained all the leading Prizes this year in the neighbourhood of Liverpool, and which cannot fail to produce excellent varieties, if not superior new kinds, 2*s.* 6*d.* to 5*s.* p. packet.

CALCEOLARIA.—From the best varieties out, mixed with their own dark-spotted seedlings, 2*s.* 6*d.* to 5*s.*

CINERARIA.—The most of which has been gathered from the bright blue, mixed with other light varieties, 2*s.* 6*d.* to 5*s.*

PANSY.—Collected from flowers of almost every hue, and of the finest form, 1*s.* to 2*s.* 6*d.*

The larger packets of all, except the Geranium, will produce from 100 to 200 plants.

A liberal discount allowed to the Trade, taking large quantities.—Wavertree Nursery, near Liverpool, Aug 24.

FOR FRAMES, GREENHOUSES, &c.

JOHN HAYES respectfully offers his Composition for rendering Brown Holland, Calico, and Irish Linen Transparent and Waterproof. His own Greenhouse is covered with cloth prepared with this Composition, and answers admirably; the cloth requiring only a coat of boiled oil once a year to render it as lasting as the wood frames; and the plants, which require only half the usual quantity of water, are more vigorous and healthy than under glass.

Specimens of the prepared cloth may be seen at Messrs. BATT and RUTLEY's, 412, Strand, of whom, or at his Nursery, West-street, Farnham, Surrey, the Composition may be had at 3*s.* 2*d.* the quart bottle, sufficient for 100 feet of cloth.

TO AMATEURS.

AN AMATEUR who has a First-rate Collection of CARNATIONS and PICOTEES would be willing to make an exchange with any Gentleman for named TULIPS and RANUNCULUSES.—Direct to A. B., Post-office, Tavistock.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND MACHINE, for depositing all kinds of Seed on the various Sorts, with the greatest accuracy and despatch.—This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of Seed intended to be planted, into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kind of Garden Seeds. In Tin, 1*l.* 10*s.* each; or with Copper Box and Tube, 1*l.* 15*s.* each. Commission allowed to Agents.

These Dibbles may be obtained of Messrs. COTTAM and HARDEN, 2, Winsley-st., Oxford-st., London, through the agency of the principal Agricultural Implement Sellers in the United Kingdom; or from the Inventor, by letter, to his address, inclosing a Post-office order for the amount.—RICHARD SMITH, Upper Hall, near Droitwich, Worcestershire.

LYNDON'S PATENT SPADE.—Sold by GREEN and CONSTABLE, Ironmongers, 36, King William-st., London-bridge. Horticultural Tool Chests, Bright Ladies' Spades, Meney's Patent Water Pots, Lord Vernon's Patent Hoes, with a general assortment of Garden Implements.

TANNER'S VITREOUS FLUID and CLOTH, a Substitute for Glass for Horticultural Purposes.—The Vitreous Cloth proves its superiority over Glass, by producing the light most suitable to vegetation, superseding the necessity of any shading, preserving a healthy moisture on the plant, retaining its bloom to a more lengthened period, less expensive, and not requiring so much attention. The above (retaining heat) is preferable to Glass for Hothouses, &c., the temperature of which is maintained with less fuel. It is equally applicable as a covering for Fruit-trees, preserving them from frost, blight, and excessive heat. The Vitreous Cloth, made by machinery, is much superior to any prepared in a different manner. By the use of the Vitreous fluid, the Cloth (after lengthened service) may be renewed.

The Fluid sold in bottles 2*s.* 6*d.* and 4*s.* 6*d.* The Cloth 2*s.* 6*d.* and 3*s.* per yard. Manufactured by N. W. TANNER, Chemist, Exeter. Agents for Exeter and vicinity, Messrs. LUCOMBE, PINCE, & Co., Exeter Nursery. Liverpool: Mr. CUNNINGHAM, Nurseryman, Paradise-street. London: Messrs. BUTLER and MUCKLEY, Herbalists and Seedsmen, Covent-garden.

N.B. The Vitreous Cloth if fixed in the manner recommended by the Proprietor, will stand *a much greater pressure* of air than glass.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d.	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & C. beg to inform the Trade that at their Manufactory in New Park st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

CONICAL BOILERS.—The Boilers invented by JOHN ROGERS, Esq., are made of several sizes, and may be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs Chandler's, Vauxhall, Loddiges', Hackney; Henderson's, Pine-apple-place, Edgware-road: Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick, and in the Gardens of the Royal Botanical Society, Regent's-park.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the Ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to JAMES CLARK, 24, Billiter-street.

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Aug. 23, 1844.

GYPSUM, &c.—Pure Gypsum (Sulphate of Lime) for Compost Heaps, Urine Tanks, Stables, &c.; also Sulphuric Acid, Guano (foreign and Potter's), Rape Cake and Rape Dust, and all other Manures, may be had of the Undersigned.

Synopsis of Prices, and mode of use, on application.

MARK FOTHERGILL, 40, Upper Thames-street.

GUANO.—The undersigned is ordered to offer the following GUANO of the first analysis and soundest quality, in any quantity, about 46 tons, ex Magnet from Ichaboe, lying at Fenning's Wharf; also a choice cargo of 460 tons hourly expected, to be delivered free at any safe port in the British Isles. CHARLES RIVERS, Sworn Guano Broker,
5, Water-lane, Tower-street.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, Aug. 23, 1844:—

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

TO FLORISTS AND ADMIRERS OF FLOWERS.
BRAIN'S CONCENTRATED LIQUID GUANO, for the Garden, Shrubbery, Hothouse, and Conservatory.

This preparation is peculiarly adapted for the development of Flowers, furnishing them with the materials (in a soluble form) out of which they weave their delicate tissues and elaborate their beauteous colouring. It has no unpleasant smell, is easily applied, and thus recommends itself, either for the Garden or Drawing-room.—Price 1*s.* 9*d.* per quart Bottle, and may be had of WM. JACKSON, late Geo. Butler, 93, Cheapside, corner of King-street, and most respectable Druggists and Seedsmen, with full directions for use inclosed.—Works, Thomas-st., Stamford-st., Blackfriars-rd.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COITAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, viz., one man and three boys. With this amount of labour, the product of a day of 10 hours is as follows, viz.:—

1 inch diameter of Tile,	11,000	1¾ inches diameter of Tile,	5,600
1¼ ,, ,, ,,	8,400	2½ ,, ,, ,,	3,200

The Machine is movable down the drying-sheds, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operation for upwards of four months at Hempstead Park, near Cranbrook, Kent. No charge made for Patent dues or licence. The purchase of the Machine includes free use of it.

ASPHALTE.—BROWN OIL VARNISH, BLACK VARNISH PAINT.—Asphalte in a pure state, without grit, 5*s.* per cwt., in casks 2 cwt. each, for forming or improving garden walks, terraces, court yards, stables, ground-floors, roofs, or for applying to damp walls. Brown Oil Varnish for varnishing gates, outhouses, fences, &c., 8*d.* per gallon—it dries very quickly. Black Varnish Paint for outhouses, fences, &c., 5*d.* per gallon.—Asphalte Roofing Canvas, very thick, 1*s.* per square yard.—ROBERT RICHARDSON, Maker of Garden Nets, Fishing Nets, Sheep Nets, Rabbit Nets, Tents, Marquees, and improved Tarpaulins, 21, Tonbridge place, corner of Judd street, New-road, London.—N.B. Several thousand Police Capes on Sale.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay-making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil-Cake Crushers	Threshing Machines for the
Double action Turnip-cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch Street, London.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130*s*, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup; giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Gal-ley Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5*s.*, 10*s.*, 20*s.*, 50*s.*, and 100*s.* each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1*l.* to 5*l.* per annum; mansions and estates from 10*l.* and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

TO FLORICULTURISTS, CONNOISSEURS, AND NURSERYMEN.

MR. E. E. STONE will sell by Auction on the premises, No. 22, Park Place West, Liverpool Road, Islington, on Tuesday next, August 27th, at 12 o'clock, a valuable Collection of Cacti, Monstrosus, Euphorbia, Aloes, and other Stove and Greenhouse Plants. Also an excellent Tulip Stage 30 feet by 10 feet, and the surplus Household Furniture, a fine-toned 6½-octave Piccolo by Peachey, and other effects. May be viewed on Monday and morning of sale, and Catalogues had on the premises, and of the Auctioneer, 83, St. John-street, near Smithfield.

TO MARKET FARMERS AND OTHERS.

WANTED, a MARKET FARM, or Land convertible to that purpose, sufficiently near London to be within reach of the Markets.—Direct to G. M., Post-office, Guildford.

THE FINEST DUTCH HYACINTHS and OTHER BULBS DIRECT FROM HAARLEM.

YOUELL AND CO. beg to inform their Friends and the Public they have just received their first Importation of the above in the finest possible condition, Catalogues of which can be had on application. They are enabled to offer "the finest Double or Single Blue, Red, White, and Yellow Hyacinths at 18s. per dozen."

Very fine ditto . . . . . 12s. per doz.
Fine ditto . . . . . 6s. "

And other Roots at equally moderate prices.
P.S.—Bulbs will be added as compensation for long carriage.
Great Yarmouth Nursery, August 22, 1844.

COUNTRY SHOW.

TUESDAY, Aug. 27 Knaresborough Horticultural and Floral.

AT the request of a correspondent, we beg to state that those who are desirous of using SULPHATE OF IRON for the purpose of disinfecting manure may procure it wholesale of Mr. WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street; or Mr. FOTHERGILL, in Thames-street.

NEW flowers or new fruits are not often fit subjects for Leading Articles. But a case has arisen to which it seems desirable to attract particular attention.

Among the countless species of rare plants, for the introduction of which this country is indebted to the Indian Government, there is a little hardy evergreen shrub called "THE SMALL-LEAVED OLEASTER," or Elæagnus parvifolia, having the aspect of the Bohemian Olive when out of flower, but being greener, and, like it, exhaling a delicious fragrance when in blossom. The shrub would not attract notice if it were not for its sweetness and being evergreen. The warm summer has brought the plant into fruit, in the Garden of the Horticultural Society; and it is this which leads us to notice it.

Under a south wall it is loaded with clusters of the most beautiful berries, not bigger than a Pea, and totally unlike any fruit as yet found at the dessert. They are oval, and bright red, but all over their skin are scattered innumerable silvery scales, which dim the redness, except where it peeps out between them, and gives the berries a singular mottled appearance. Inside is an angular stone, with a thin shell. The flesh which covers it is of the consistence of a Plum, and of so very pleasant sub-acid a taste, that, if there were more of it, the fruit would certainly be held in as much esteem as Plums.

Now it strikes us that in this instance we have at last the promise of a new class of fruits, if gardeners will set themselves to cultivating it. The plant possesses the important attributes of hardiness, abundant bearing, and good quality; but the fruit is in the usual state of wildings—lean and bony. The latter defect was once the fault of the Peach, the Plum, and the Cherry: we see what cultivation has brought them to; and the success of perseverance without skill in working upon those fruits, seems to justify our hoping as much from the Elæagnus, when subjected to perseverance aided by skill. What chance has brought about in the course of centuries, science may be expected to effect in a few years. In short, we believe that the fruit of the Elæagnus may be brought to the same condition as the Plum, by judicious management.

The course to take is this:—As soon as the plant again shows fruit, every means that experience may suggest should be taken in order to increase the size of a small number of the berries. Those means are excessive thinning, constant watering with liquid manure, and full exposure to the sun. Such means may be expected to increase the size of the berries immediately. The seeds of those berries should be sown in very rich soil; the vigour of the seedlings should be promoted by ample room for the roots, active manure, copious watering, and the brightest sunlight. In two years such appliances will have produced strong seedlings, with an abundance of firm well-formed wood. In the beginning of the third year, the oldest and best wood should be grafted on the common Bohemian Olive (Elæagnus angustifolia), stocks of which should be got ready for the purpose. The succeeding year, the grafts may be expected to bear. When that happens, the same process of manuring, thinning, and sunning should be followed, until the fruit is ripe. Little doubt can exist that the first seedling fruit will indicate a manifest tendency to enlarge; if so, the point is gained—for the moment we can succeed in producing in a plant a disposition to change, we know, from experience, that the change will go a long way, provided we continue to encourage the disposition.

Another way would be, to hybridise this small-leaved Oleaster with the Zinzeyd, or Elæagnus hortensis, whose fruit is as large as an Olive, and eaten in Persia, although it is too insipid for European tastes. By that means an immediate enlargement of the fruit would be certainly obtained; but, perhaps, at the expense of its quality.

Should these remarks attract the attention of any ingenious experimenter, we would suggest, in addition, that some experiments ought at the same time to be made upon grafting the Oleaster, because the operation is not at present practised, and it is uncertain what method may be most successful. And if this point were not determined beforehand, the seedling scions might die, after all the pains of rearing them, and the whole work would require to be commenced over again, or at least an entire season might be lost.

There will probably be some difficulty just now in procuring the Small-leaved Oleaster, but the Fellows of the Horticultural Society will easily obtain it another year. In the meanwhile, if nothing else comes of these suggestions, it is useful to make the tree known, as a capital shrub to be introduced into game preserves, for the sake of its berries. Any quantity of the seed can be procured from the Botanic Garden, Saharunpur.

AMONG the luxuries which seem necessary to the state of a great man's household are all sorts of flowers, fruits, and vegetables, forced into unnatural maturity at unheard-of seasons. The *alienis mensibus æstas* is the measure of patrician gardening; and so completely has the taste for precocious enjoyment fastened on the public mind, that the "forced" things, which opulence only can command, are valued at a great price, while the very same objects, left to Nature for perfection, are too often consigned with indifference to the multitude. Did the expense connected with such unseasonable gardening insure equivalent advantages, it would be a harmless indulgence, and wise mode of eliciting skill and stimulating to exertion. Were the subjects of it, brought to maturity three or four months before their customary period, really improved in quality, or even rendered as good as they naturally are, there would be still greater reasons for its encouragement. But, in the majority of cases, the *pallida poma* of the Romans are only another name for the forced productions of modern England; and many of the objects thus early acquired are inferior, in every important respect, to what they are when suffered to mature at the allotted time. Their great recommendation is, that there must have been an unusual outlay of money and skill in rearing them. Such an outlay may, no doubt, be defended on many grounds, and we are the last to depreciate the consummate skill with which it is often applied. We would only impress upon gardeners that it is not, as is often supposed, the *sole* end of their profession.

The great end of gardening is to improve the qualities assigned to plants by Nature, to the utmost extent of possibility, and it is a secondary object to bring such things into use at any period besides the natural one.

It is therefore a question of some moment, whether those means, which are so efficient in forcing, might not be more usefully employed in ameliorating the same productions at the natural season; and also, whether intrinsic excellence ought not to be sought for more than that fictitious value which attaches to unseasonableness. Let no one fear that wealth would lose its mark if this were so. There can be no difficulty in seeing that money and talent will always keep in advance of limited resources in the hands of the ignorant, and that the distinction which is now attained by forcing would be equally, and we think better, established by superiority of produce. That too is surely a less enviable distinction which depends on having things out of season, than the one which is founded on real and decided excellence of quality.

The majority of vegetables and fruits that are forced are less nutritious, less digestible, less palatable, than natural crops; the standard by which their merit is measured is not so much their good quality as their earliness and external appearance. We, however, regard the highest aim of the grower to be the production of positive rather than comparative superiority; and this can only be effected by assisting Nature at the right time, instead of overstraining her energies by an artificial stimulus. Certainly there are exceptions, but they do not affect the general argument, and we pass them by for the present.

Let it not, however, be supposed that we depreciate forcing, properly so called. We would simply urge that it is not of first-rate importance, and that the greatest share of a gardener's attention should be bestowed on giving his produce the best quality at the season when it naturally appears.

With respect to flowering plants, no one needs telling that their productiveness, their beauty, and the fragrance of their blossoms, are materially lessened by forcing; and yet how many of them are hardly ever grown except for blooming early. The Hyacinth, for instance, is universally used for decorating plant-houses or drawing-rooms, but how few cultivate it as a border flower. To get bad forced Roses in March, is regarded as a matter of more importance than to produce the finest natural Roses in June. To be sure it is very desirable to have Roses, Lilies of the Valley, &c., blossoming in winter. The evil is, that the possession and improvement of plants in such circumstances is often more cared for than when they flourish in all their natural conditions.

It is doubtless a proud feeling for a Gardener that he can chain Nature to his side, and, refractory as she is, that he can bend her to his absolute will. It is a great thing thus to assert his superiority over the menial servants of a household; and we trust that he will ever maintain that empire of intellect which raises him, in the minds of thinking people, above the herd of domestics. But we would submit to him that his power may be exercised and his empire maintained in more ways than one; and that the improvement of the absolute quality of a plant is quite as much worthy of his notice as the forcing its unwilling stores to be given up at all seasons at his imperious command. We none of us like much to act upon compulsion, and we may depend upon it plants agree with us in that respect.

ON "FIXERS" AND "RETARDERS" OF AMMONIA.

I THINK I perceive a little confusion of ideas in the way in which some writers apply the term "fixer" of ammonia to a variety of substances which they recommend for this purpose. I have more than once seen the *Gardeners' Chronicle* quoted as authority on this point; as, for instance, at p. 41 of Mr. Hannam's useful little work on "Waste Manures." Now, surely, it is not judicious to apply the same term "fixer" to the effect produced on carbonate of ammonia by sulphuric acid and certain sulphates, and to that produced by charcoal, bog-mould, &c. By the former class of substances the carbonate of ammonia is decomposed, and the sulphate of ammonia is formed; that is, a volatile salt is replaced by a fixed salt. Here we may say the ammonia is "fixed." But the other class of substances, the charcoal, &c., effect no decomposition of the carbonate of ammonia: they merely "retard" its escape into the atmosphere; they cannot even retain it for an indefinite period. We are, therefore, producing two very different results according as we use a "fixer" or a "retarder." In the former case we shall apply to the soil a result (the sulphate of ammonia) which must undergo a fresh change before it can be serviceable to vegetation; whilst in the latter we apply the carbonate itself ready for action. Without speaking positively, I think we may argue *à priori* that a "fixer" will produce a more permanently valuable effect on manure than a "retarder," if we reason according to the present position of the still advancing inquiry that is making into the theory of vegetation. According to Boussingault it is probable (and Liebig states the same thing), that the sulphate of ammonia must be decomposed, and the carbonate of ammonia restored, before the nitrogen can be fixed in a plant. I find some writers on Agricultural Chemistry very careless in the terms they make use of: they talk of ammonia when they mean carbonate of ammonia, and of lime when they mean carbonate of lime. This conventional negligence may not mislead proficients in chemistry, but we, who are only partially initiated, are sometimes apt to be puzzled by such inaccuracies. Precision in the application of technical terms is the very soul of science. I have penned these remarks in consequence of seeing that Mr. Mechi, in his third letter on Agricultural improvement, speaks of introducing into his tank "a layer of earth or gypsum between each layer of manure," so as to secure the ammonia. I do not know whether it has occurred to him that the action of the two substances here named must be different; the former being what I have called merely a "retarder," whilst the latter may very possibly be truly a "fixer." I have just read Mr. Mechi's letters with very great pleasure. This is indeed something like coming to the point. If Mr. Mechi be correct in his speculation,—and his arguments appear to be generally such as should command attention,—then must our present race of farmers turn over a new leaf, or most assuredly some of them will get pushed from their seats. Mr. Mechi reposes a laudable confidence in what practical men have shown to be advisable, and a wholesome faith in what science has proved to be true. He is now trying, on a very bold scale, to apply the best resources of practice and science to the regeneration (I think we may call it) of a wretched hungry soil, and its conversion into sound fertile land. Let all farmers watch him narrowly, but let them be very cautious of prejudging him, as it seems by his own account many of them are disposed to do. If his speculation should only prove half as successful as his enterprise and intelligence deserve, the laugh will be sorely against some of our farmers of the old school. Let them rather read Mr. Mechi's letters, and digest them; then, whether this particular speculation of his prove successful or not, they will not fail to profit largely by his reflections, and improve their own notions by his suggestions.—*J. S. Henslow, Hitcham.*

THE ROSE-GARDEN.—No. XVI.

(*Continued from page* 524.)

Annual Pruning.—The annual pruning of the tree Rose takes place in the first week in March. Previous to detailing the manner in which this must be done, it

may be well to observe that the growth of a tree is thus:—the rings round the bottom of both stem and branches are the depositaries of dormant buds, which will not be called into action unless the buds above be injured, or unless the sap arise so profusely as to be unable to expend itself by the upper parts, in which case the buds below break out; though, indeed, they will occasionally do so, as the natural act of the tree, in preference to rising higher. This is more observable in the Wild Rose than almost any other plant, and perhaps may, in some degree, explain the reason why budded Roses are shorter lived than those on their own bottom; for any one who has at all observed the growth of wild stocks must have noticed that the original head is seen generally on hedges in much worse plight than the shoots which have been subsequently formed at its base. This tendency of the Dog-Rose to break out below must be checked in two ways: the first, by destroying every sucker and shoot as it starts; and the second, by finding full work for the sap above, and by giving it a free passage. If, then, upon cutting in a tree at pruning time, a couple of buds be left on every shoot of last year's growth, or three at most upon a very strong one (with free growers no rule can well be given), there will be quite enough to occupy the sap, keep the tree within bounds, make it much handsomer, save the sap the expense of maintaining old wood, and give it a free course.

Grafts differ from buds in this respect, viz., that an inserted scion must be considered as a tree which has finished throwing up its suckers, and whose vitality and appearance depends upon the shoots to be produced from buds at the points or sides of the wood already formed. An inserted bud may be considered in the light of a seed sown at the top of a stock, instead of in the ground; it seems to retain the same habits (though limited in extent), and to form its roots, as it were, at the point of insertion, throwing up suckers from thence as it would have done from the ground. Such large shoots, then, as spring at once from an inserted eye, do not come under the same restrictions as those at the points of old wood, which are necessarily more feeble, and the buds upon the bases of which are in a more forward state of preparation for breaking out than the base buds of a vigorous shoot direct from the eye. The latter must be treated according to the position it is intended to occupy; to its strength, and to the state of the wood, and the buds which are upon it. If the buds at the base appear very undefined, and consequently disinclined to break, cutting it in low causes a fresh production of free-growing wood; while, if the same shoot were moderately shortened, the buds at its summits would not only break out freely, and continue the regularity of the tree, but, in the event of excess of sap, recourse would be had to the base buds to expend it. Gardeners, in general, trim such shoots as may be here denominated suckers, or crown shoots, low or high, in proportion to the rest of the tree; but with reference to the health and appearance of the tree, it is only necessary to observe that close cutting is calculated to produce wood, and moderate amputation flower.

If there be more sap than enough, a fresh shoot will likely enough start from the crown of the graft, or the rings upon the first year's shoot, and increase the head of the tree, as well as bring it back with new wood nearer home—a matter always desirable, as tending to keep the head from straggling.

Cutting to the lowest buds always leaves the sap with but a short channel to pass through, strengthens the branch below the buds, and is every way beneficial, if care be taken that a sufficiency be left to occupy the sap.

There are, however, several sorts of Roses, which are, with more or less difficulty, brought to flower when thus treated; and such plants as are found to throw nothing but wood, must frequently be allowed to retain a considerable portion of the last year's produce to insure their flowering: in these cases, a much greater degree of experience is necessary, than when a decided rule can be laid down; the operator must be able to distinguish between flower and wood buds, the former of which are oval, the latter pyramidical: he must learn not only the quantity to be left on each shoot, from the general appearance of the tree, but in a degree also with reference to the shoot itself; thus, pruning the plant altogether in a different manner to that above pointed out, it is obvious that, under such circumstances, it is far more difficult to keep the head near home than when trimming year after year to a stated number of buds; the removal of wood which has straggled away is also more frequent, and the form of the head altogether much more difficult to preserve. Whenever a tree is destined to remain year after year where planted, an equal attention should be paid to the appearance of the future, as well as of the present; but where the current season only is of importance, the plant should be encouraged to produce the greatest possible quantity of flowers; a mode of treatment which has been known to kill fruit-trees entirely. Such plants as throw little or no flower, are in general, from the nature of the thing, more healthy and vigorous than when the contrary is the case, and half standards will therefore be found less productive than whole ones, while the wood is in general finer, the stem more rapidly enlarged, and the head stronger. The larger the shoot, the more likely are the buds upon it to form wood; the bolder the buds, the more likely are they to throw flower; the fifth bud from the base is generally a wood-bud, those above it producing flowers; with a light soil, however, and a hot sun, flower will be produced under any pruning; nor is it by any means uncommon to see a brilliant show of flowers upon old shoots which are annually cut down and layered for the sole purpose of multiplying the number of plants, and of producing wood only.

If the tree be not pruned at all, it will lose its shape entirely in a single year, and become more and more unsightly, each succeeding one. Trimming the shoots has nothing essentially different in the manner of execution to trimming the stock; in trimming to a bud, barely the thickness of a sixpence should be left above the bud,

R

and the excision should form a slant about equal to that caused by dividing a square from angle to angle: if more were left above the bud, it would die down to the bud, and prevent the bark from healing over the wound; in general, the line of the bud is the slant the knife should make in its passage through the shoot.

Cutting out old wood should always take place where it is feasible, the desirable point being to keep near home, as it is called; when, therefore, a tree throws out a fresh and vigorous shoot, close to the base of an old branch which has straggled too far from the graft, the old wood should be cut out in March, close to its base, and the young shoot left to supply its place, and receive its nourishment. This principle, well applied, will always keep the trees in bounds; but as this requires judgment, and cannot well be explained in writing, it may be requisite to take a lesson upon the subject, the first convenient opportunity, from a scientific gardener.

ICE-HOUSES.

Perceiving in a late Number a letter from a correspondent desirous of building a small ice-house at a cheap rate, I beg to inclose a plan of a very cheap one. It would be better to have three or four such small ice-houses than one large one, as the air gets in, and causes the ice in the latter to dissolve before a third of it is consumed. The following plan is proved by experience to be at once cheap and efficacious for its purpose.—*B. D., Greys.*

REFERENCE TO PLAN.

A B A conical hole in the ground.

C B. Stones or rubble, to act as a drain, 18 inches.

A D. Slabs, 4 feet high above the surface.

E. Door.

F. A Trap-door, to answer a similar one on the opposite side, to be opened in a dry air, and carefully closed when the circumambient atmosphere is damp.

THE FLORIST REFORMER.—No. II.

THE POLYANTHUS.

Among Polyanthuses there have not been so many candidates for floral honours as among other florist flowers, consequently there are less synonymes in this class than in any other. The few that have been twice named have been done so apparently by mistake; and those few were raised by Mr. Hufton, of Nottinghamshire, well known for having introduced many good Carnations and Picotees, as well as Polyanthuses. It is said that Mr. Clegg, of this neighbourhood, who bought the stock, named them, and that Mr. Hufton also did the same; they are known principally by the name the latter gave them, in the midland counties.

The Polyanthus has experienced less improvement than any other class of florist flower, and this is principally owing to the great sameness in seedlings to the parent from which they were raised. The following list contains the whole of the Polyanthuses cultivated in this neighbourhood; they are classed according to their merits, and are not distinguished by the colour of the ground—as dark, red, and scarlet.

First Class.

Barrow's Duchess of Sutherland	Hufton's Earl Grey, *alias* Clegg's Lord John Russell
Buck's George the Fourth	
Bullock's Lancer	Hufton's Lord Rancliffe, *alias* Clegg's Prince of Orange and Clegg's Golden Hero
Clegg's Lord Crewe, *alias* George Canning	
Crownshaw's Invincible	Hufton's Lord Lincoln
Collier's Princess Royal	Maude's Beauty of England
Cox's Regent	Nicholson's Bang Europe
Eckersley's Jolly Dragoon	Ollier's Beauty of Over
Gibbon's Sovereign	Pearson's Alexander
General Bolivar	Saunders's Cheshire Favourite
Fletcher's Defiance	Wood's Espartero
Hilton's President	Goud's Independent.

Second Class.

Beauty of Coven	Nicholson's Ranger
Buckley's Squire Starkie	" Nonsuch
Burnard's Formosa	" King
Dew's Britannia	Sir Sidney Smith
Faulkner's Black Prince	Head's Telegraph
Fillingham's Tantarara	Turner's Emperor Buonaparte
Queen's Earl Fitzwilliam	" Princess
Hepworth's Elizabeth	Timm's Defiance and
Jolly Sailor	Yorkshire Regent

—*John Slater, Cheetham Hill, Manchester.*

Home Correspondence.

Ice-Houses.—Ice being water in a solid form, acquires its solidity by the process of losing its heat. It is a law of matter, that when a mass of ice shall, by absorption, imbibe a certain amount of heat, equivalent to that which it has lost during the process of congealing, it assumes its natural or fluid state. If two bodies of equal solidity are placed near each other, the one heated, the other of the temperature of the surrounding atmosphere, it will be found that, after a short time, the heated body will, by the law of radiation, lose its heat, and the cold body, by absorption, will imbibe a portion of that heat until both indicate the same temperature. The more compact a body is, the slower it is in acquiring heat, and it is equally slow in parting with it. Now I consider the ice-house and the surrounding atmosphere as two bodies, the one (the atmosphere) being heated, and the other cold; consequently the colder body, viz. the ice, will absorb the heat radiated by the surrounding medium, the result of which is, that the ice resumes its fluid state. From these remarks it would appear that one great object in the preservation of ice is to exclude the air by every possible means. Many do take this precaution; but in contradiction to this, I beg to mention the practice of a gentleman who frequently, during the warm days of spring and early summer, (for he never has any ice afterwards,) orders the ice-house doors to be thrown open for a few hours, to dry, as he expresses it, the ice and walls of the building. This he denominates the American mode; and, for those who wish to hasten the departure of their ice, a most efficient mode it is. With respect to the situation of the ice-house, if the place is dry and well screened from the sun, little importance is to be attached: the great secret lies in the body of ice being compact, in order that it may resist, as much as possible, the absorption of heat; and, for becoming as solid as possible, there is no substance so good as snow, which possess all the qualities of ice. I am sure that if snow was well beaten and trodden until the ice-house was quite full, beginning the treading at the bottom, and gradually proceeding, making quite firm each thin layer, to the top, the body of snow would acquire such compactness as would resist the heat of our summers. For instance, how often do we see the snow-balls which the schoolboy makes, resist the action of the open air and sun for days, while a heap of ice of equal size would disappear in half the time, from the fact that it is less compact, and therefore absorbs heat more readily? If ice could, by any means, be reduced to powder similar to snow, the result would be far better than under the present method, although the water, which is necessarily mingled with it, would, in some measure, spoil its keeping. In Italy, where ice is looked upon not only as a luxury, but as a necessary of life, the inhabitants of the mountains, in order to meet the demands of the valleys, collect the snow, and, packing it into the fissures of the rocks on the shady side of the mountains, find no difficulty in keeping a supply when the heat of summer has arrived. From this source is derived all the snow which cools the drinks of the thirsty Neapolitan, and which enables him to wash down his favourite dish of maccaroni, or cool his palate beneath a cloudless sky.—*Walter Wakefield.*

Bees.—The history of the bee has been written with so much truth by Huber, that little is left for inquiry. I know but of one error, which is, I presume, by the translator. The extraordinary fecundity of a queen is stated to be 200 eggs a day. A queen which deposited no more eggs than that, could never produce a swarm, on account of the daily loss of bees which go out to the fields. I have had queens which laid 1000 eggs daily for three months in succession. This summer, in a glass hive containing one comb four feet square, the queen deposited 800 eggs a day, or 16,000 in 20 days, 2000 of which were males. My glass hive is two feet square; the glasses are one inch and a half apart, which compels the bees to build but one comb. The object of this communication is to inquire if any correspondent can solve the following queries:—As the queen knows when she is to lay a drone or male egg, in what way is that knowledge acquired? What difference is there in the size of male and common eggs? Does one ovary contain male eggs only, or are they to be found in every ovary?—*A Lover of Truth.*

Guano.—A neighbour of mine has found among his guano a perfect egg. Is this usual? The egg is about the size of a duck's: it is discoloured by the guano, but does not appear to have been speckled or mottled. The shell is very firm, and the interior is so dried as to rattle on shaking the egg.—*Frederick H. Sankey.*

Liquid Manure.—The dryness of the season has been very unfavourable to the growth of summer Cauliflowers. I sowed some seed about the end of February, on a slight hot-bed, protected only by mats; after being planted out, they suffered severely, both from the weather and from grubs; and it was only by means of frequent watering that I saved a fair quantity. Having good faith in liquid manure, I gave each of them one good dose of it, and notwithstanding the dry weather, I have had a much better crop than I expected. I cut a head last week which weighed 3lbs., and another since—dressed in the usual manner for cooking—which weighed 5½ lbs. It measured 10 inches in diameter, and 30 inches in circumference; this is a proof of the value of liquid manure for this much esteemed vegetable. The plants were not over-grown, but were close and compact, and were not attacked by grubs, which were very troublesome during spring and summer. I am not aware of any effectual mode of destroying them, and would be glad to receive a hint on the subject. I contemplate

dressing a piece of ground with lime and soot, having it well dug, and allowing it to lie exposed to the weather all winter, in the hope that this may eradicate the evil. I have lately applied a good dose of liquid manure to all my winter Greens, and I can already perceive a most beneficial result; they have made rapid growth during these last few days.—*Henry A. Wood, Statfold Hall.*

Growth of Trees.—As you say, in reply to my question about the growth of forest-trees, that you are not aware of any exact observations on the subject, and as your correspondent of last week only repeats an old story of an observation very imperfectly taken, you will, I hope, allow me to state the result of my experience, which causes me to doubt the generally received opinion, that wood lengthens after being formed. The Fir-tribe offer the most convenient subjects for inquiry, as the growth of each year is in them clearly defined, as far as the lower branches are permitted to remain on them; and I find that Spruce-trees in a sheltered situation, in the fifth year of their growth, form top-shoots measuring as much as 2 feet 4 inches, and in the seventh year, as much as 3 feet; and in the same kind of tree, equally sheltered and in the same soil, I find that on trees aged 18 years the shoots, which were formed in the fifth and seventh years of their growth, do not exceed those measurements. I have also found that an Oak-tree of about 30 years' growth which I measured in two places, which I marked, for the purpose of ascertaining its increase in circumference, did not lengthen between the marks, although it increased in circumference about 2 inches in one year.—*A Subscriber, Ireland.*

Miltonia Spectabilis.—At the last Glasgow Horticultural Society's Exhibition there was, among other well-grown specimens of plants sent by Mr. Turnbull, gardener at Bothwell Castle, a very fine one of this rare plant, about 3 feet in diameter, with some 35 expanded blossoms, and a good many more to open; the leaves were of a very dark green, which is also quite unusual with the plant.—*A Subscriber.* [We have seen nothing like this in the south.]

The Polmaise Heating.—I believe there are upwards of ten or a dozen different systems of heating hothouses described in the *Chronicle*, but perhaps none of them possess the essential properties to such a degree as the Polmaise system, namely, simplicity and efficacy. I have seen the new vinery that has been erected at Polmaise, by William Murray, Esq., and it only requires to be seen at present to be admired; the luxuriance of the Vines, the size and number of the bunches and berries, all testify that the system upon which the house is worked is one that agrees well with the growth of the Vine. If those who have not seen it would only imagine luxuriant shoots, with leaves approaching in size to the foliage of the Tussilago Petasites, with clusters of the black Hamburgh Grape more than a foot long, with enormous shoulders supported with small cords, they might have some idea of the plants and fruit at present growing in the vinery at Polmaise, heated by means of hot air issuing from a chamber at the back of the vinery. There is another thing attending the Polmaise heating, which, perhaps, may be worth noticing, namely, the crest-fallen appearance of some who considered themselves among the best Grape-growers in Scotland; they have watched the progress of the Vines from time to time, and at present they consider themselves beaten. Some of them may not be fond of innovations, but in order to raise their dejected spirits, and maintain their character as successful cultivators of the Vine, some change must be made in their present system. I was informed by Mr. Carmichael, the gardener, that the difference of temperature between the front of the house and that part where the hot air enters is only about 5 degrees; he also showed me a graft which he put upon one of the Vines. This season it has made a shoot corresponding in strength with the other Vines in the house; it has also a bunch of Grapes upon it: the variety is the Muscat of Alexandria. It is thought by some Grape-growers that this variety should have a small vinery for itself, as it requires a higher temperature; but a short time will prove how it agrees with its new situation. At present, the Vines in the house grow as freely as common Cabbages in a well-manured garden, or Willows by wet ditches.—*Peter Mackenzie.*

The Grey Parrot.—"A Constant Reader" wishes to be informed if any remedy can be applied to prevent a favourite bird picking off its feathers. The usual food has been bread and milk, chicken bones, &c., but notwithstanding every attention to diet, the unsightly bird continues to devour every wing and tail feather as soon as they appear.—*N. S. H.*

Destroying Wasps.—The mode of destroying wasps described at p. 541 is a very old affair, and by no means so simple and effectual as the one with turpentine, discovered by Professor Henslow, and detailed in the *Gardeners' Chronicle*, p. 637, 1842. Even on this latter method, however, a great improvement has been made by putting the turpentine in a bottle, instead of a cup, and inserting the neck of the bottle in the hole leading to the nest, and surrounding it with some earth, in the way recommended by a correspondent, "B. C. K.," at p. 556, vol. 1843. Very little turpentine is required—merely as much as will wet the sides of the bottle. If applied in the dusk of the evening, every wasp will be dead by the following morning. In no instance have I known it to fail of the desired effect, excepting in cases where the nest was deeper in the ground or at a greater distance from the mouth of the hole than I had anticipated. A partial failure may sometimes occur where there happens to be two entrances to the nest instead of one, but a second application the following evening is sure to prove effectual.—*M. E. H.*

Abies Douglasii.—The following account of the loss of a very fine Abies Douglasii may prove interesting to some of your readers. In the year 1830 I received from the Horticultural Society's Garden, at Chiswick, two plants of Pinus ponderosa, one of P. cembra, and one of A. Douglasii. They were all planted in a shrubbery here together with a young Deodar plant, the soil being a fine light loam, formerly a garden. All throve well for about five or six years, when the two Ponderosas were attacked by an insect which fed on the pith of the young shoots, and every year destroyed them. The plants, consequently, got stunted and deformed; one was taken up, and the other, though still alive and making efforts to recover, presents a wretched spectacle of disease. The others throve apace; the Cembra is a noble-looking tree, a picture of health and beauty; but the Douglasii and the Deodar became the admiration of all who saw them, and confessedly, so far as I was assured by many well-informed gardeners and nurserymen, the finest specimens in Scotland. The Douglasii had attained the height of more than 30 feet, being a growth of more than 2 feet (about 2¼ feet) per annum. During the summer before last (1843), we remarked that two of the lower branches dried up and withered; but as the tree still looked vigorous, we hoped it was owing to some accidental cause. In the winter, however, I remarked a less healthy hue stealing over other branches; and in spring, while the other trees were beginning to make their shoots, the unfortunate Douglasii was observed gradually to change colour, like a branch separated from the stem: no swelling of the buds took place, and by the end of May, when I returned from an absence of some months, it had become red as if scorched with fire—the tree was dead. A friend in the neighbourhood, who has very extensive plantations, and who has studied the matter much, having called one day and seeing what had occurred, suggested that the cause would probably be found to be in the roots having struck through the congenial soil into some unfriendly stratum below; and that, as all of the Silver Fir species love a moist soil, this had in all likelihood penetrated to the dry gravel which forms much of our subsoil. His forester having come some days after, examined the spot with my gardener; and, on digging beside the tree, found that the roots had struck into a dead sand, where they had been literally starved. The unusually dry weather of this spring had accelerated the catastrophe. The Cembra continues as healthy and vigorous as ever; and the Deodar, though not more than 11 feet high, spreads its thick pensile branches over a circumference of 10 yards, resembling a fountain of green waters in the regularity of its weeping boughs.—*James B. Fraser, Moniack, Inverness.*

Local Horticultural Societies.—Mrs. Thomas Lewin, principal secretary and treasurer of the Eltham Horticultural Society, presents compliments to the Editor of the *Gardeners' Chronicle*, and begs to contradict the statement lately given in it of the falling to the ground of the above Association. Being assured it cannot be his wish to discountenance the smallest exertions in such a cause, she begs to tender her assurance, that though its object is little more than parochial improvement, and had not been supposed worthy of notice in such a register as the *Chronicle*, yet that its Editor may record it as doing successfully, and affording an example easy of imitation to all parishes where a few persons will take the management of it.—*Barn House, Eltham.* [We hope our correspondents will be in future more cautious in their reports of dead Societies. We rejoice to find that the Eltham is flourishing, and wish it all the success its managers can desire.]

Flower Garden at Tandridge Court.—I imagine that if my neighbour, "W. H. M." had resided in the neighbourhood at the time the Flower Gardens were made here, which is nearly ten years ago, he would have found that the first operation was draining. If he had referred to my former statement, he would have found the pond mentioned in it. To our great disappointment, we found only one spring, and the water from it is conveyed through the garden in an iron pipe. "W. H. M." might have stated that, in order to add to the number of beds, the present design of the Flower Garden is the third that has been made on the same spot. He might also have stated that some of the beds are on a sandy bank, and look equally well with those in the horse-pond.—*J. Clark, Tandridge Court, Surrey.*

Pine-Apples.—In February last I had about 100 Pine-suckers potted into six-inch pots, and plunged over the rims of the pots, in a bed composed of two-thirds leaves, and one-third fresh tan, 20 inches deep, and heated by means of hot-water tanks below. In May the plants having filled the small pots with roots, were shifted into pots 10 inches wide and 9 inches deep, the sides being perforated. These were plunged in the same pit, so that the rims of the pots were 2 inches below the surface of the bed. The plants grew very well, making stiff short leaves of the finest healthy hue. On the 12th of this month I took them out of the pit again, and found that not only the pots were filled with roots, but that they had extended through the holes at the sides, and over the rims of the pots, in many cases as much as 20 inches. The plants were not watered during the whole season, but merely syringed overhead on the afternoons of fine days. The bed was always in a medium state of dryness, and the soil in the pots was the same. Perhaps those who are now engaged in discussing the relative fitness of leaves and tan for Pines to root in, will be able to draw some conclusion from these facts that may help to set the matter at rest. I will only add, that nothing could be more satisfactory to myself than the present state of the plants, many of which I hope to have in fruit in February next.—*G. Fleming, Trentham.*

Valerian Root.—No doubt many unverified traditions have been perpetuated, and some from a remote antiquity, without sufficient inquiry. How is this, as to the continually re-asserted predilection of cats for Valerian? Thinking it might have remedial effects, in case of indisposition, I tried it. I found the cat would drink an infusion of druggist's Valerian, with plenty of milk, but not at all without. I found no disposition to touch or smell the drug, or the fingers which had handled it. The same indifference was manifested for the leaves, stem, and blossom of fresh Valerian. I find no difference between cat and kitten in this respect, and can discover no appearance of truth in the story. Can you either affirm or deny it? The same questions apply to the Mint called Nepeta Cataria. But I cannot try it, as I do not know the plant, or where to find it.—*A. H.* [If your Valerian roots are fresh, and given to male cats, you will soon find that the influence of it is perceptible enough.]

Transmutation of Corn.—In the *Gardeners' Chronicle* of the 17th inst., I observe an article in which you give an account of an experiment tried by Lord Bristol, suggested by the old German notion that one species of grain, if cut over in an early stage of its growth, will in the following year produce grain of another description. Having heard of this hypothesis several years ago, I determined to test it. Accordingly I sowed a small patch in the kitchen garden with Oats, and cut them over several times before the flowering stems appeared. The following spring many of the plants were dead, but the leaves of those which remained had very much the appearance of Barley. I showed this to Mr. Smith, of Deanston, and several other eminent agriculturists, who thought that the plants were of the Barley species; and I had not previously informed them why I wished to have their opinion. They grew luxuriantly, and in the course of a few weeks I felt the ear in the sheath, which, when it opened, showed magnificent seeds of Timothy Grass. Whether this was a transmutation, or whether the Oat plants had died, and dormant seeds of Timothy Grass had taken their place, I know not. I determined to try the experiment again, and did so with Oats, Barley, and Wheat. I gave these the same treatment as in the former case; and the second year, although many of the plants had died, those which survived showed ears of Oats, Barley, and Wheat, just as they had been sown. I am determined again to test this theory, and, by way of greater security, I mean to sow the grains in flower-pots—two seeds in each, having the mould well examined to prevent, if possible, the presence of any other seeds. Although rather late for this season, still I shall try it this year, as well as next at an earlier period.—*J. S. R.*

Foreign Correspondence.

Extract of a Letter from one of the Secretaries to the Wellington (New Zealand) Horticultural Society; dated Wellington, 19th Feb., 1844.—His Excellency has granted to our Society 10 acres of land in a very convenient situation, for the purposes of a garden, and we only want increased funds to avail ourselves to the utmost of this liberal provision. I was led to recommend the packing of fruit and other trees in zinc cases through an inadvertence it is needless to explain; and I regret this the more, as it may be productive of injurious consequences. The trees—Apple and Pear—to which I alluded in my former letter, and which, after being nine months out of the ground (the vessel not sailing until five months after the time stipulated in the advertisement), are now flourishing in my garden, some of them having borne fruit this season, were packed in a deal case, in Moss only, and without straw. At Valparaiso I witnessed another successful instance of this way of packing. A Frenchman arrived there, after a voyage of nearly four months, with several cases of flowering shrubs and trees from France, in the very best order. They had each a small ball of earth to the roots, which were afterwards wrapped in Moss, and the plants were packed in the same material to prevent their being disturbed. I am anxious to correct any error, because a case of plants was sent to us by the London Horticultural Society, packed air-tight, and they all perished. In the warm latitudes these air-tight cases prevent evaporation, and this causes fermentation, especially if straw be used, as in the instance of a case I received, with the other alluded to above, containing Peach, Plum, Gooseberry, and Currant-trees, all of which died. I hope a better fate is reserved for the Vines you are good enough to promise us, and which I expect with great impatience. They shall receive every care, and I have provided for them an excellent situation. I feel greatly obliged by your promise of the Poppy and other seeds; if I may venture a suggestion, you cannot forward them in a better way than by post, inclosed in brown paper, as a letter, or as you sent the Trifolium, every seed of which grew, and it has since been widely disseminated through this and the neighbouring settlements. You would also greatly oblige me by sending in this way a few Cucumber and Melon seeds; Cucumber seeds I have not yet been able to save in the colony. I am making another effort this year. From the inquiries I have made I find neither Box for borders nor the Lily of the Valley are to obtained in Sydney or Van Diemen's Land; the common Primrose and double and single Violets, we have. I must confess a great partiality for the established favourites of the gardens of our fatherland; they have a double charm, from early associations.

I am anxious to make a collection of Roses—in my opinion the most beautiful flower in a garden; I have nine varieties, and have written to England for 20 others. It requires some philosophy and patience to tax the imagination while we indulge in the pleasures of anticipation, until at length we have those of fruition; but I believe the collection of useful and ornamental trees or plants in the colony is more complete than could be reasonably expected in so short a time. While on this subject, I may mention a curious fact I learned at Tahiti.

S ome 20 years since a well-meaning person thought to confer a benefit on the island by introducing the Guava. It has since spread most rapidly, and is now the pest of the place, as it is necessary to eradicate it whenever cultivation is attempted; it is, in truth, the only clearing required. I will take care to make a collection of dried specimens for you, as you wish, and forward them by some convenient opportunity. I refer you to those *Gazettes* containing an account of the establishment of an Agricultural Association, and two articles written by myself advocating its uses, to show that your suggestions have been attended to, where any hope of success presented itself. You will be glad to learn that the harvest this year has been very good; they are now busy cutting; the weather is very fine, and there is every prospect of an abundant return.—*Robert Stokes.*

COUNTRY SHOWS.

Cambridge Florists' Society, July 25.—At this Exhibition the following Prizes were awarded: Carnations.—Mr. Twitchett, P.P., Headly's Empress of Purples. *Scarlet Bizarres*: Mr. R. Headly, Rainforth's Gameboy; Mr. Twitchett, Twitchett's Don John; Mr. Ready, do. *Crimson Bizarres*: Mr. Twitchett, Ely's Lord Milton, Mr. Marshall, Mansley's Robert Burns; Mr. R. Headly, Lord Milton; Mr. Wood, Puxley's Queen; Mr. Rickard, Jacques's Georgiana; Mr. Ready, Wakefield's Paul Pry. *Scarlet Flakes*: Mr. R. Headly, Addenbrooke's Lydia; Mr. Wood, Lydia; Mr. R. Headly, do.; Mr. Ready, Wilson's William IV.; Mr. Rickard, do. *Purple Flakes*: Mr. Twitchett, Headly's Empress of Purples; Mr. Ready, Lascelles's Queen of Sheba; Mr. Wood, Kenney's Excellent; Mr. R. Headly, Mansley's Beauty of Woodhouse; Mr. Twitchett, Headly's Incognita; Mr. Ready, Macbeth. *Rose Flakes*: Mr. R. Headly, Bates's Briseis; Mr. Twitchett, Hudson's Lady Flora Hastings: Mr. Ready, Ely's Lady Gardiner; Mr. R. Headly, Brookes's Flora's Garland; Mr. Wood, Ely's Lovely Ann; Mr. Twitchett, Wilson's Harriet. Seedling Carnations. *Scarlet Flake*: Mr. Twitchett, Twitchett's Hannibal. *Purple Flake*: Mr. Ready, Read's Mary Ann. Picotees.—Mr. Wood, P.P., Wood's Princess Alice Maude. *Red (heavy-edged)*: Messrs. R. Headly, Rickard, Ready, Green, Dickerson, Sharp's Duke of Wellington. *Red (light-edged)*: Mr. Ready, Sharp's Hector; Mr. Rickard, Sharp's Gem. *Purple (heavy-edged)*: Mr. Wood, Wood's Princess Alice Maude; Mr. Marshall, Brinkler's Conductor; Mr. Ready, Church's Victoria; Mr. Twitchett, Sharp's Invincible; Mr. R. Headly, Mitchell's Nulli Secundus. *Purple (light-edged)*: Mr. Ready, Brinkler's Purple Perfection; Mr. R. Headly, Seedling; Mr. Twitchett, Purple Perfection; Rev. J. Thackeray, Giddins's Laura; Mr. Twitchett, Ely's Grace Darling. *Rose (heavy-edged)*: Mr. R. Headly, Wilmer's Princess Royal; Mr. Green, Green's Queen Victoria. *Rose (light-edged)*: Mr. Twitchett, Crouch's Ivanhoe; Mr. J. Marshall, (Seedling) Marshall's Augusta; Mr. Twitchett, Brinkler's Beauty of Cranfield; Mr. R. Headly, Waine's Victoria; Mr. Wood, do.; Mr. Twitchett, Crouch's Prince Charlie, *Yellow Picotees*; Mr. Richard, Howlett's Paragraph; Mr. J. Marshall, Martin's Victoria; Mr. Ready, do.; Mr. Wood, do. Seedling Picotees.—*Light-edged Purple*: Mr. Twitchett, Twitchett's Queen Mab. *Light-edged Rose*: Mr. J. Marshall, Marshall's Augusta. *Heavy-edged Purple*: Mr. Twitchett, Twitchett's Cassandra. 2 *Balsams*: 1, Mr. Ready; 2, Messrs. Hudson *Cockscombs*: Mr. R. Headly. *Specimen Plant*: 1, Messrs. Hudson, Hoya carnosa; 2, Mr. Ready, Fuchsia globosa.—*Cambridge Chronicle.*

Devon and Exeter Botanical and Horticultural Society.—This was the 48th Exhibition; the weather was most auspicious, and the company numerous. From the garden of Mrs. Wells were a fine Cattleya Harrisoniæ, Stanhopea oculata and insignis; Lycaste Deppei and Skinneri, &c. Of *Stove or Hothouse Plants*; Ixora coccinea, a good I. crocata, Cyrtoceras reflexa, Rondeletia speciosa, Achimenes hirsuta and multiflora, &c. Of *Greenhouse Plants*: Phœnocoma prolifera and Crassula coccinea, Leschenaultia formosa, Boronia viminea, Pimelea Hendersoni, &c. The *Heaths* were remarkably fine, containing good specimens of ampullacea, reflexa, alba, tricolor, inflata and jasminiflora, &c. *Pelargoniums* comprised Beck's Leonora, Admiral, Meteor, Lyne's Sunrise, and Duke of Cornwall, &c. A fine plant of Lilium lancifolium, and some Cut Flowers were also from the same collection. From the garden of J. W. Buller, Esq., were Cattleya Harrisoniæ, Oncidium flexuosum, O. Papilio, Acropera Loddigesii. *Stove Plants*: Pavetta caffra, a noble plant 9 feet high, and covered with 200 bunches of white blossoms; a fine Clerodendron squamatum, and C. paniculatum, Ixora coccinea, Rondeletia speciosa. *Greenhouse Plants*: A fine plant of Roella ciliata, Aphelexis humilis, a good Leschenaultia formosa, Mirbelia dilatata, Boronia crenulata, Tecoma jasminoides, and a fine specimen of Fuchsia exoniensis. From Mr. Buller's were also a collection of Verbenas, Cockscombs, and Balsams. Mr. R. Webber had a stand of *Carnations* and *Picotees*; among them we noticed Hogg's Champion, Queen of Sheba, Wilson's William IV, Harry Giddings, Lady Payne, Countess of Surrey, Heath's Superb, Duchess of Kent, Clark's Wellington, Burtle's Lady Talbot. Of Fruits there was a fine display, for which the following prizes were awarded:—*Pine Apple*: 1, Enville, 7½ lbs., E. Lousada, Esq.; 2, Queen, 6 lbs., Mrs. Wells. Dish of white *Grapes*: Muscat of Alexandria, E. Lousada, Esq. Best flavoured *Melon*: Blackhall Green-flesh, S. Kingdon, Esq. *Apricots*: Moor Park, J. W. Buller, Esq. *Nectarines*: 1, Red Roman, Sir J. Kennaway, Bart.; 2, Elruge, H. Porter, Esq. *Plums*: Orleans, H. Porter, Esq. *Cherries*: Bigarreau, Sir J. Kennaway, Bart.; May Duke, F. Cross, Esq. *Red Gooseberries*: Roaring Lion, H. Porter, Esq.; *White ditto*: Batt's Favourite or Old Dutch, H. Porter, Esq.; *Yellow ditto*: Royal Sovereign, H. Porter, Esq.; *Green ditto*: Ocean, J. W. Buller, Esq. *Red Raspberries*: Antwerp, J. W. Buller, Esq. *Dessert Apples*: Juneating, T. W. Gray, Esq. *Dessert Pears*: Citron des Carmes, H. Porter, Esq. *Strawberries*: Elton, S. Kingdon, Esq.—*Exeter Flying Post.*

Forres and Nairn Horticultural Society.—This was the summer Exhibition. The show of flowers was equal, if not superior, to that of any former meeting. Fruit and Vegetables were rather scarce, owing to the long-continued drought. The Prizes awarded are as follow:—*Calceolarias*: Mr. M'Murtrie, gr. to J. Dunbar, Esq., for Duchess of Buccleuch, Lady Constable, Lady Peel, Armosa, Eliza, Grandiflora, Lass of Richmond Hill, and Bain's Queen Victoria. *Pelargoniums*: Mr. Hopkirk, gr. to Major C. Bruce, M.P., for Priory Queen, Foster's Alicia, Gem of the West, Garth's Perfection, Coronation, Eliza Superb, Britannia, Alexandrina, Victory, Fanny Garth, and Princess Royal. *Stove Plants*: Mr. Hall, gr. to Sir W. G. G. Cumming, Bart., for Hoya carnosa, Thunbergia alata alba, and Gloxinia speciosa. *Greenhouse Plants*: Mr. Hall, for Clematis Sieboldii, Thunbergia aurantiaca, Philibertia grandiflora, Crassula coccinea and Fuchsia Brandsii; 2, Mr. Brander, gr. to N. M'Leod, Esq., for Achimenes longiflora, Epiphyllum Jenkinsonii, Erica ovata, Cytisus canariensis, and Leschenaultia formosa. *Specimen Fuchsia*: Mr. Hall, for Chandlerii. *Cinerarias*: Mr. Hopkirk, for Splendens, Royal Blue, King, and North Star. *Petunias*: Mr. Nimmo, gr., Moy House, for Superba, Vesuvius, Squib's Seedling, Mountfordiana, Mrs. Weymss, and a seedling. *Stove Plant*: 1, Mr. Hall, for Manettia bicolor; 2, Mr. M'Murtrie, for Ixora coccinea. *Pelargoniums*: Mr. Nimmo, for Jewess, Victory, and Alexandrina. The following articles were sent for exhibition from Dalvey.—The curious Pitcher Plant (Nepenthes distillatoria), the Butterfly Plant (Oncidium Papilio), Erica ventricosa superba, v. prægnans, tenella, spuria, ceruthoides ovata, hybrida, perspicua, &c.; Polygala speciosa, Leschenaultia formosa, and Pimelea decussata; also a Ward's case containing Heaths, Oncidium flexuosum, &c. From Altyre—Gloxinia maculata, rubra, Youngii, and several seedlings. From Mr. J. Gillan, Epiphyllum Jenkinsonii, Ackermanni and speciosum, Cereus speciosissimus and flagelliformis. From Sea Park—Erica ventricosa, and ovata, Leschenaultia biloba, and Statice arborea. From Holm—Gloxinia candida, double Yellow Rose, &c. From Springfield Cottage—Victoria Rhubarb.—*Forres Gazette.*

North-Riding Horticultural and Floricultural Society, July 26.—This was the second meeting for the present season. The plants in pots, cut flowers, fruits, and vegetables, were numerous and in great perfection. The Prizes were awarded as follows:—*Stove Plant in Pot*: 1, Mrs. Parkin, for Achimenes grandiflora; 2, Mr. Pinkney, gr. to T. S. Walker, Esq., for Hedychium coronarium. *Greenhouse Plant in Pot*: 1, Mr. May, for Lilium lancifolium punctatum; 2, Mr. Jackson, for Erica ventricosa superba. *Fuchsias*: 1, Mr. May, for Stanwelliana; 2, Mr. Jackson, for Formosa elegans. Among Fruit, Mr. Graham obtained a first Prize for Frontignan Grapes.

The Norfolk and Norwich Horticultural Society.—This was an excellent Show for the season. The collections of Picotees were larger than on former years. A seedling exhibited by Mr. H. Cooke, was said to be of first-rate quality. The petal is of the Rose form, of fine substance; the crown is well up, and the habit excellent. The Fuchsias were well-grown, and presented a rich appearance. A Yucca gloriosa in bloom was exhibited by Mr. Short, gr. to Mr. J. Stracey. Mr. Short, gr. to H. N. Burroughes, Esq., showed a seedling Dahlia of good form and substance; which, if it retains its habit, will be a valuable flower. Its colour is a deep velvety dark maroon. Melons, though numerous, were scarcely so fine as on former occasions. Strawberries were fine in size; but they were not well flavoured. From the gardens, Bracondale, were Erica Hartnelli, Irbyana, viridiflora, ampullacea, Westphalingia, Jasminiflora alba, refulgens, gemmifera; Fuchsia Britannia, Paragon, Kentish Hero, Robusta, Princeps, Alata, Eclipse, Nobilissima, Majestica, Duke of Wellington, Brockmanni, Lindleyana, Maria, Champion, Exoniensis; Campanula fragilis; Achimenes longiflora, grandiflora, and rosea; Rivina humilis, Crowea saligna, Lycopodium stoloniferum, and denticulatum; Polypodium aureum, Nerium splendens, Sollya salicifolia, Lisianthus Russellianus, Acrostichum alcicorne. The following prizes were awarded—*Picotees (white ground)*: R. Fellowes, Esq., for Kirtland's Queen Victoria, Miss Bacon, Miss Jane, Miss Irby, Hope, Harry, La Polka, Princess Royal, Teazer, Purpurea elegans, Red Rover, Rebecca, Joan of Arc, Sir W. Middleton, Harlequin, Maid of Orleans, Mrs. Bevan, The Queen, Nottingham Hero, Burroughes's Seedling, Parmegiano, Fair Flora, Grace Darling, and Nulli Secundus. *Fuchsias*: Mr. Short, gr. to H. N. Burroughes, Esq., for Formosa elegans, Stylosa maxima, St. Clare, Globosa major, Conspicua, Mirabilis, Standishii, Blanda, Insignis, Magnifica, Dalstonii, Venus Victrix, Chandlerii, Grandis, Youelli, Invincible, Carnea, and Racemiflora; Maurandya Barclayana alba, C. Middleton Esq.; Ipomœa Learii, Mr. Short. *Pine Apples*: Queen, Mr. Stewart, gr. to W. Bagge, Esq., M.P. *Grapes*: Black Hamburgh, Mr. Gale, gr. to H. N. Burroughes, Esq.; Grizzly Frontignan, extra prize, C. K. Thompson, Esq.—*Norwich Mercury, Aug.* 3.

Reviews.

Gramina Britannica, or Representations of the British Grasses, with Remarks and occasional Descriptions. By J. L. Knapp, Esq. 2d Edition, 4to. Longmans.

The late President of the Linnæan Society called the first edition of this book "an elaborate work," and not without reason. Its fault has always been its rarity—an evil now remedied by the issue of a second edition.

It is a volume of 119 coloured 4to plates of Grasses, drawn with great care, and offering such excellent likenesses that a person of no botanical skill cannot fail to recognise the species by their assistance. And this gives Mr. Knapp's book great value, for the larger part of the persons interested in the art of distinguishing Grasses are country gentlemen and farmers, who know nothing of Botany, and cannot use the technical descriptions or analytical figures of Botanists. To that great class such a book is invaluable. It ought, in fact, to form a part of the library of every one interested in rural affairs who can afford to buy it; for there are few plants so difficult to distinguish as Grasses, not any more so, and none which it is more important to know correctly, because of their various uses and qualities. With Mr. Knapp's book before him no one can have the least difficulty in making himself master of the subject.

We must also add, that the plates are tastefully drawn and carefully coloured, and the printing a beautiful specimen of typography, so that the work, independently of its practical value, forms a handsome drawing-room volume. Indeed, we know of no book of its kind so exactly what would be wished for by a lady who is turning her attention to the study of this interesting branch of Botany.

Orchideæ in the Collection of Conrad Loddiges & Sons. 12mo. 1844.

A new edition of this remarkable Catalogue has just appeared. In addition to its other merits, it now includes references to the books in which species are figured, which makes it extremely useful as a book of reference. The enormous extent of Messrs. Loddiges' collection may be judged of when we mention that the numbers of Orchidaceæ cultivated by them now, extend to 1916. The highest number in the last Catalogue was 1654.

NOTICES of NEW PLANTS WHICH are EITHER USEFUL OR ORNAMENTAL.

Hindsia violacea. Porcelain blue Hindsia. (*Greenhouse Shrub.*) Cinchonaceæ. Pentandria Monogynia.—The generic character is taken from this species and from the closely allied Rondeletia longiflora of Chamisso and Schlechtendahl, which may be characterised as a second species of Hindsia. It is much to be regretted that these plants should have been referred to Rondeletia, from which they differ so much in appearance, and from which they may be essentially distinguished by the form of the corolla rather funnel-shaped than salver-shaped, without any callous contraction or beard at the mouth of the tube; by the capsule, which (according to Chamisso and Schlechtendahl separates by the splitting of the dissepiment into two cocci, which are loculicidally split, and by some other minor points. Nearly the same characters distinguish them also from Sipanea, which is quite as nearly related as Rondeletia, though very different in habit. They have also been compared with Bouvardia, and in some respects resemble the large white-flowered species of that genus, but independently of all minor distinctions the Hindsias have the ovules and probably the seeds of the tribe of Rondeletiæ, not of that of the Cinchoneæ. The Hindsia violaceæ differs from the better known H. longiflora, chiefly by having much larger, broader, and more downy leaves, the flowers much larger and more hairy, and by the calyx, of which one, two, or three divisions are much larger than the rest, and more or less dilated and leaf-like above the middle. Both species vary in the size of the flowers, and in the shade of their colour. In the H longiflora also, and perhaps in H. violacea the stamens are entirely included in the tube of the corolla in some specimens, and in others the tips of the anthers protrude. In the latter case the style appears to be less prominent than in the former, so that these differences may arise probably from a certain degree of sexuality. For the foregoing matter we are indebted to the kindness of Mr. Bentham, who agrees with us in regarding the Rondeletia longiflora wrongly referred to the genus in which it has been placed. This Hindsia violacea is one of the finest things obtained from South Brazil. It has been imported by Messrs. Veitch and Son of Exeter, who received for it the large silver medal at the Horticultural Society's Garden Exhibition in May last. It will doubtless prove a very easily cultivated greenhouse plant; and is certainly unsurpassed in beauty by blue flowering shrubs.—*Botanical Register.*

Aerides virens. Green-leaved Air Plant. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—This is a beautiful addition to that set of Aerides of which A. odoratum was the first discovered. Like its flowers, these are deliciously and very peculiarly sweet-scented, and not at all inferior in size. Each sepal and petal has a deep purple blotch at the end, while the remainder is a delicate soft French white. The lip is speckled with crimson, and bears in the middle an inflated, sanguine, serrated tongue. The leaves are much alike in all these plants, but here they are of a peculiarly bright green, which circumstance has suggested the name. It flowered in April, 1843, in the stove of Messrs. Loddiges, who imported it from Java.—*Botanical Register.*

Garden Memoranda.

Birmingham Botanic Garden.—This garden still maintains its position, and although not supported with that liberality which might be expected from such a populous and wealthy neighbourhood, is nevertheless firmly established with a slightly-increasing income—a satisfactory circumstance which will be gratifying to those who feel an interest in everything that has a tendency to promote and extend this useful branch of natural history. Many of the shrubs and trees are beginning to develope their forms and specific characters; and these are times, and this too a locality, when such glorious objects, collected from all countries, and brought together by great enterprise and capital, will in the end be rightly appreciated and supported. The hothouses are placed on an eminence commanding a view of vast extent of country; but at the same time exposed to the bleak and [illegible] winds that prevail in this district, and which give them, even in summer, a cold and desolate hue, when viewed in connexion with the surrounding vegetation. It is well to study effect in placing public gardens especially; but when the end and object of them are destroyed in the accomplishment of a mere ostentatious spectacle—which is by no means uncommon—these monuments of comparative uselessness will be but a poor recompense for the thousands expended, and present an easy solution for the decline in public patronage. They will ever remain drags on an institution of this kind, which moves, or ought to move, by its examples of superior arrangement and construction; and as a consequence of such superior cultivation, such and such only will, and must be the right and proper stimulants of a refined taste in Horticulture, more particularly when exemplified in the public gardens of the country. Mr. Cameron, the well-known curator of this garden, has brought together a collection of 360 species of Ferns, many of them very rare: we observed Trichomanes brevisetum, var. Andrewsii, flowering finely, and although a native of Ireland is not now to be found there. Phyllopodium rigidum was thriving well, as was also the rare Pyrola uniflora and secunda. On the exposed and elevated ground, subject to every vicissitude and severity of climate, is Abies religiosa, where it has braved with perfect impunity two winters, confirming the statements recently advanced in the *Chronicle* respecting the hardiness of this beautiful Fir. In a similar situation, and unprotected, are Pinus Hartwegii, P. teocote, P. pseudo strobus, and P. patula, all thriving perfectly. Mr. Cameron remarked that the Mexican coniferæ in our humid climate make late growths, and of course suffer from the early frosts; planting them on high situations in dry soil will obviate this, and we may calculate upon seeing those magnificent trees from the high parts of Mexico, forming objects of as much interest as those from the north-west part of the same continent. Alnus jorullensis and Aralis japonica are quite hardy here, and growing luxuriantly, as is also Coriaria nepalensis. Cupressus thurifera, one of the most rapid-growing species, is also found here to be perfectly hardy. The Cedar of Goa, so tender in some situations that even in Devonshire we have seen it killed here on this elevated and completely exposed situation stood the winter of 1837-8, and is now in a very vigorous state. The different species of Cistus and Heleonthemem die here only of old age, and never from frost. Veronica decussata has stood two winters unprotected, and is now a fine bush. One of the most remarkable plants in the whole garden is Fuchsia discolor, a large bush between five and six feet high, and ten feet in diameter of the branches, covered with flowers and fruit. Mr. Cameron never could flower this Fuchsia in a greenhouse, but on planting it out it soon began to exhibit this tendency, and is now a magnificent object, and

perfectly hardy and permanent shrub. These judicious trials of exposing plants will do much to place a proper value on those from the high regions of tropical countries, and will read a lesson to many who select warm nooks and sheltered sites for plants otherwise accustomed to brave the scourge of the four winds of heaven. —*R. G.*

Miscellaneous.

Culture of the Double Rocket.—The double garden Rocket (Hesperis matronalis flore albo pleno), is one of the most interesting plants we have. Although it is three centuries since it was introduced from Italy into this part of the world, it has still a great number of admirers, although it is very capricious as regards soil, and rarely lives many years in most gardens. I have cultivated this plant for many years, and with much success. It is true, that the soil of my garden is considered to be particularly favourable for its culture; nevertheless, I am convinced that if particular care were not bestowed on the plant, as I shall point out farther down, the soil alone could not secure us against the loss of our plants. I consider it quite hardy, little affected by light or shade, not caring whether the soil is stiff or light, damp or dry, and able to support any degree of cold. It has many enemies, but, if I am not mistaken, one only that is fatal; if haste is not made to prevent its bad influence, this enemy will soon destroy the plant, which seldom escapes from its attacks: I therefore regard the Double Stock as an ungrateful plant, which makes an ill return for all the care that is bestowed upon it. The enemy in question is the larvæ of an insect, at present unknown, which probably deposits its eggs in the stem of the plant, or even in the crown from whence the young shoots proceed. These larvæ, when they are allowed to exist, eat out for themselves a way, till they come to the young shoots, which they infallibly destroy, along with the mother plant, the following spring. The latter appears, at first, to be sound and well, and the young branches unfold; but in a few days the leaves turn yellow and wither, the stem droops, and the interior, when examined, is found to be hollow, and gnawed at its base. It is often seen that at the same time the upper leaves are surrounded and held together by the threads of a little grub. People fancy that this grub is the cause of the death of the plant, but that is a mistake, for such grubs may be found upon either healthy or unhealthy plants, and in reality only eat the ends of the leaves, without attacking either the flowers or the stems. The destruction of the larvæ in question, at the right time, is therefore one of the most important things in the culture of the Hesperis matronalis; it is not difficult to effect, and does not require much attention; the little trouble that it occasions is well repaid by the success. Here is my method:— After the flowering, towards about the middle of August, cut off the stem close to the ground, for the purpose of exciting the root to make some shoots. About the end of September—a week sooner or later, according as the shoots are strong—take the plant entirely out of the ground, and separate the shoots one by one. That done, divide the old root in two by a vertical incision. If the inside is quite healthy, green, and full of pith, without circles or violet streaks, the shoots may be planted with perfect success. If, on the contrary—and it is generally so—the old root is hollow, violet or black inside, or only marked with circles and streaks of those colours, the shoots must be examined attentively at the part where they joined the mother plant; cut a little piece off, and you will always find, before you come to the first radical fibres, a little white curved grub the size of a grain of rape-seed. It must be killed, and then the shoot will become a healthy and vigorous plant. I have never discovered two maggots in the same shoot; nevertheless, all the shoots that the infested stock produces in the autumn will perish the next year. If by chance the grub is not found in some of the shoots which have the symptoms before described, they must not be planted among the others, for you may be sure that they will perish in the spring like those which might not have been examined; for the grub is often hidden and difficult to find. It is necessary that the separation of the shoots from the old stump should be done with care, to be better able to examine each; and if some are without roots they may be treated like cuttings, for they will soon produce roots. When the plants have made many shoots in the autumn, they may be again divided in the spring, either to multiply the number of plants, or more especially, to obtain stronger and handsomer bunches. To look for grubs in the middle of spring is useless, for there are none. Cuttings of three or four eyes, separated from the stem, easily take when they are placed in the shade, and kept moist; the best time to make cuttings, is when the lower flowers are ever. When they are made later, we reject those which are hollow or violet inside; for although they make some roots like others, they are sure to perish in the spring. It is useless to winter old plants, for out of 20 stems which they may throw up, 18 at least will perish in the spring, and the remaining two will only bear insignificant flowers. Otherwise, the culture is so simple, that it is not necessary to say one word about it. Stagnant water in winter, and excessive heat in summer, alone kills them. (*Annales de l'Association Hort. de Prusse*, xv. p. 77). *Note.*— The insect which the author of this article indicates as the most dangerous enemy, is the larva of a fly, called by Entomologists Anthomyia brassicæ. It appears to be the same insect that causes the excrescences that are remarked on the roots of Cabbages, and are often the despair of gardeners.—*Revue Horticole.*

The Common Heron.— The animosity prevailing against this fine bird arises from his frequenting the ponds for a few small fish. For this offence he falls a prey to the gun of the keeper, and the miserable emblems of his success greet the eye, nailed against the barn-door, or other more convenient site. Thus, for the preservation of a few fish, is this noble bird allowed to fall a sacrifice to ignorance and cruelty. I remember a keeper anxiously in pursuit of one who had made his appearance on the edge of a magnificent piece of water, and ventured to plead, but in vain, for his preservation. The water in question was of such an extent, that vast indeed must have been the congregation of these birds to have made any serious diminution of its inhabitants.—*J. M.*

Pot Drainage.—We have received from a correspondent "A." at Lincoln, some samples of zinc clippings, cut circular, and punched full of holes, so as to serve for the drainage of the bottoms of water-pots. If they do not choke up, they will be very useful, because they will effectually hinder worms from drawing into the pots. Our correspondent assures us that they answer the purpose perfectly.

Stones made Buoyant.—A stone crossed the Firth with the S.W. wind of the 5th. A single plant of seaweed had grown upon it, and, being covered with numerous air-bladders, migrated with the stone to the north shore. Upon being lifted out of the water, the stone weighed 3 lbs. 11 oz., and the material of the plant 2 lbs. 3 oz., making in all a weight nearly of 6 lbs., which the buoyancy of the air inclosed in a multitude of small pods had safely ferried over. The plant did not seem to be loaded to its full floating power; although some of the pods had been injured and some burst, enough remained entire to transport the stone, thus suggesting an idea to all makers of floating jackets, chairs, and other contrivances to be used in shipwrecks, never to inclose the air in one mass, but in a great number of subdivisions, each watertight, and containing each a number of little balls filled with the gas. A slight injury, such as perforation of a pin, may now render the best Macintosh-floater fatal. Not so, however, with the algæ when they go a-sailing, and execute on a small scale what icebergs are said to have performed in transporting the large boulder stones over the globe.—*Caledonian Mercury.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Almost all the soft-wooded stove plants that can be grown into large specimens by one or two seasons' growth, like Pelargoniums, may be conveniently treated like that popular tribe: cut them back after they are done flowering, keep them dry for a week or ten days, and then shake them out of the mould, shorten their large roots, and pot them in light rich compost in as small pots as their roots can be got into. This is a good time to look over a collection for this purpose. Where a large conservatory is to be kept gay all the year round, this class of stove-plants is by far the most useful to cultivate, as you can always winter them in little room, whereas fine woody plants will soon get too large and take some years before they are fit to appear in a good conservatory. Another great advantage is, that as soon as you get these plants established in the new pots, they will only require to be kept in that condition through the winter, and therefore will not require more than 50° of heat for three or four months.

Conservatory.—Pelargoniums that have been struck from cuttings early last March, and planted in the reserve garden early in June, should now be fine plants for flowering late in autumn, their first attempt at blooming in the open ground has been checked, of course, and now as their second flower buds are well formed they may be taken up carefully and re-potted. Some people commit a great error at this stage, by putting such plants into heat at once; this should never be done; the grand point is to keep the leaves as free from excitement as possible, until the roots get hold of the new soil; a cool close frame covered with canvass is the best place for them; but in the absence of this, the north side of a wall or hedge will do; sprinkle them over the leaves twice a day, and in ten days they get over the check, without losing a leaf. Chrysanthemums and all other plants that are planted out for a summer's growth—a very excellent practice—should be treated in this way, and should not be allowed to remain in the ground too late; keep the conservatory dry from this time, and little air is required, except for keeping down sun-heat, now that the growth of most plants is nearly over.

Pits, Frames, &c.—There are many of the new Verbenas that will force admirably through the winter, with little heat; this is the time to get a supply for this purpose. The new Veronica speciosa also forces well for early spring, and although nearly a hardy plant, will stand as much heat as an Ixora. Pentas carnea and Manettia bicolor will answer likewise, and all lovers of the lovely Chinese Azaleas, who can afford it, ought to have the new varieties of them mentioned last May and June. The Nurserymen have been very successful in propagating them, and they may now be had reasonable. The old Luculia is as much sought after as if it were a plant of recent introduction, a proof that it is not a long liver under cultivation; it flowers freely in loam, but for pot cultivation and in the hands of beginners hardly any loam should be used; equal quantities of peat, leaf-mould, and sand will keep it in good condition for many years. When it is growing freely it can hardly have too much water, therefore it should have a good drainage, and ought to be under-potted. Every one knows by this time that it grafts as freely as an Apple-shoot on several stocks.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Before the propagation of plants for turning out is proceeded with to any material extent, it is as well that a proper arrangement should be made as to what number of plants are required in another season. To keep up the interest of a garden, especially if planted on the grouping system, requires some considerable skill and forethought, to vary the scene in each succeeding year so as to prevent the arrangement becoming monotonous. Thus if warm colours prevail to any material extent this season, it would be as well to introduce a majority of cold colours next season and to edge each bed of the latter with its complementary warm colour. Indeed the system of edging beds with contrasting colours imparts a highly interesting feature to the flower-garden, and more especially to such beds as may be distributed over the lawn without any methodical arrangement. For these purposes no plants are so well adapted as those which have variegated fehage, and for that reason a large stock of variegated Pelargoniums should be provided. The best of these is Mangles's variegated, the common and golden variegated, and the different varieties of variegated Ivy-leaved Pelargoniums. The rose-scented variegated is an interesting variety, as is also a very small-leaved variety called Dandy. This variety makes the neatest edging for a small bed of any plant that I am acquainted with. Of common Pelargoniums some of the best for beds are the Prince of Orange, Alexandrina, Oliver Twist, Coronation, Gauntlet, Bijou, Sabrina, Gipsy, Garth's Perfection, and most of the very free blooming varieties. Of the Oak-leaved kinds, Moore's Victory is very neat, Robinson's Unique also makes a fine bed, and the old Fair Ellen is not without interest.

Routine.—Attend particularly to the regulating of overgrowths, especially in Petunias and strong-growing Verbenas; keep them well cut in so as to form neat beds, and yet do not let there be any appearance of their having been cut. Mow, sweep, roll, and keep all neat and clean, and if there is any worm casts in the walks water them with lime-water.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Carnations.—Layers must be regularly and carefully watered whenever dry weather makes it necessary, and all weeds should be removed as they appear. Those who layered their plants early will have many sufficiently well rooted to remove. Amateurs and others commencing the cultivation of these beautiful flowers, and they are, we are happy to find, on the increase, will do well, as we before have urged, to obtain their layers in good time. The following list of very fine varieties we have proved, and recommend them with the greatest confidence to young beginners; and those growers who do not already possess them should add them to their stock.—*Scarlet Bizarres*, Elliot's Duke of Sutherland, Hepworth's True Briton and Gameboy; *Crimson Bizarres*, Ely's Lord Milton, Wakefield's Paul Pry, and Greatley's Lord Brougham; *Scarlet Flakes*, Bucknall's Ulysses, Greasley's Marmaduke, and Wilson's William the Fourth; *Purple Flakes*, Brabban's Squire Meynell, Pollard's First rate, and Ely's Mungo; *Rose Flakes*: Ely's Lovely Ann and Lady Lily, with Hutson's Lady Flora; *Red Picotees, light edged*, Sharp's Hector and Gem, and Wood's Queen Victoria; *Heavy-edged*, Jessop's Sir William Middleton, and Sharp's Wellington; *Purple Picotees, light-edged*, Bunker's Perfection, Gadden's Vespasian, and John's Prince Albert; *Heavy edged*, Dickson's Trip to Cambridge, Sharp's Invincible, and Musson's Charlotte; *Light-edged Rose*: Gadden's Favourite, and Barnard's Mrs. Barnard; *Heavy edged*, Green's Queen Victoria, and Wilson's Fanny Irby. *Ranunculuses*.—Seedlings in pans or boxes, which ought to have been kept growing as long as possible, should now, if the Grass is withered, be taken up; this must be done with great care, as many of the roots are very minute. *Dahlias*.—Earwigs are more than usually annoying; small pots in which a little dry Moss is placed may be fixed on the supports, and examined every morning.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—The cloudy weather that has prevailed of late has been favourable for the plants lately repotted. Those which are found to have commenced rooting may have air admitted as usual, and shading may be dispensed with. If the surface of the soil is exposed to the atmosphere it will be necessary to water occasionally; but if covered an inch or two with tan nothing more will be required than syringing over the leaves on the afternoons of fine days. Pay attention to the pits heated by dung, turning and renewing the linings, when the heat is found to be declining. Take an early opportunity before winter of laying in a stock of soil, if it be not already done. Choose the turf about two or three inches thick, from a field or common where the soil is of a firm, loamy nature. It will be in good condition for Pine-growing by February, if laid up now in narrow ridges in a dry, airy situation, where the sun and wind can act upon it. In October, after a few drying days, it may be thatched with dry Fern, or, what is much better, covered with a moveable roof, shanting both ways, to throw off the rain, and supported by posts at the corners sufficiently high to allow of a current of air passing between the covering and the soil.

Vineries.—The Vines intended to be started in November may be pruned now, if the leaves are fading. Do not shorten the spurs of these too much, as the chances of their showing well are very much less than if they were not to be started before the end of January; and by leaving two or three eyes there is more certainty of a regular crop; and it is easy to rub off the top buds at any time, if the bottom ones show. Prune also the Vines in pots, for early forcing. There are few better purposes to which any spare lights can be applied from this time till the Vines are started than placing them over the borders to keep them dry, and if a board is placed on edge under the lights, so as to exclude the cold air, a great deal of heat may be accumulated in the soil by the end of October, when the lights should be removed, to give place to a good thick thatch of dry Fern. Something of this kind, if well done, would contribute much to the success of early forced Vines. The wet weather, after the long drought, has caused an increased growth in most late Vines, and care must be taken not to stop the laterals so much, as to cause any of the principal eyes to start. Be careful to prevent drip, and persevere in guarding against damp, from whatever cause, where ripe Grapes are. I do not recommend the top-dressing of Vine borders, at this late period, so long as the Vines are growing; but as soon as they are pruned, let a mixture of the best dung, chopped turf, and road-scrapings, be laid on the border, to assist the Vines in the following season.

Peach-houses.—The trees in the early house have now completed their growth, with the exception of an occasional rank shoot or two, which should be stopped as often as they start. Let the surface of the inside border be loosened up, and as much of it removed as possible without injury to any of the fibres. Replace this with a mixture of half-decayed turf, from a rich pasture and soot—eight barrowfuls of turf to one of soot.

Figs.—Where Figs are on the back wall of a late Vinery, let them on the first fine day have their final watering for the season, as it will be injurious to the Grapes to moisten the soil beneath them after this time.

Strawberries.—If the earliest laid plants have filled the pots in which they were laid, cut the runners, and a few days after shift the plants into six-inch pots, using a compost of decayed turf and dung, laid together two years previously. Stand the pots in an open situation, on boards, or slates, or a preparation of ashes, to prevent the ingress of worms.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Strawberries.—Proceed with making fresh plantations, choosing well-rooted runners, or such as have been taken up and pricked out in beds previously. It matters little whether they are planted in beds or in rows, provided the plants have a sufficiency of room. The ground should be well trenched and manured, and if the soil is of a stiff nature, the addition of a considerable quantity of gritty matter will be of advantage for keeping the ground open, as no spade ought to be inserted among them until they are finally dug down. For general purposes, no sorts are preferable to Keen's and the Elton Pine, and by planting on different aspects they will furnish a very early and a very late supply. Some of the new sorts I have not seen, and of others, such as Myatt's British Queen, I, as well as others, have got a spurious kind. Other sorts that have come under my notice are not comparable to the above two sorts, when both flavour and productiveness are taken into consideration. Rows or beds intended to produce next season should now have all their runners removed, and the plants thinned out, that the buds left may be fully matured. By adopting the latter practice, and surface manuring, one plantation will produce plentifully for a series of years, though this is not generally desirable, as it would interfere with a rotation of cropping.

Cucumbers.—Those on ridges have generally done well this season, but we cannot expect them to do so much longer, unless there are means for protecting them. Take every opportunity of securing heating material to keep in a healthy vigorous state those in frames. If you can command plenty of dung you may think yourself very fortunate: but if, like many more of us, you find that a very scarce commodity, you will not think

of taking any vegetable matter, capable of producing heat by fermentation, to the rubbish heap, until it has parted with its heat in the frame-ground. *Seed weeds.*—A few of these will sometimes make their appearance in spite of us. It is of little use cutting them down and leaving them, or having them conveyed to the rubbish heap, as many of them, though scarcely in bloom, contain succulence enough in their stems for the perfecting of their seeds, and thus, in either case, take care to insure us with a supply next season. The method I adopt is to have all weeds in flower carefully conveyed to any lining where there is a strong heat, which I find sufficient to destroy the germinating powers of the seeds of our common weeds. *Mushrooms.*—When a bed is wanted early and there is no half-exhausted lining to go to, get some good fresh dung from the stables, rejecting the very longest; make a bed from a foot to 18 inches thick, where you can protect it from rain; beat it firmly, and as soon as the heat rises bore it with holes all over; watch the bed carefully, and as soon as the heat gets about milk warm fill the holes nearly full; wait to see if it does not heat again too violently, and then spawn and earth up as usual. Fine Mushrooms will be thus produced, but much judgment will be requisite to spawn at the proper time.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—For the ordinary routine, refer to directions given in late Nos. Make preparation for any additional planting that is contemplated, by holeing or trenching the ground; this should be done in autumn where the soil is dry, but in cold and wet situations spring is the best time for the operation.

Coppice.—Attend carefully to young shoots from stools that were cut over during last winter and spring; regulate, thin, and train those shoots that are growing vigorously; pinch the ends off the weakest shoots, and reserve only as many of the strongest as will be required for use. I prefer shortening the supernumerary shoots to taking them clean out, for the first and second year, as it prevents them in a great measure from being so easily broken off by wind, or barked and bitten off by hares and rabbits. A stake and bandage will be often required in order to secure an upright leader to any favourite tree or plant that has been headed off, or otherwise lost its leader: many trees that have been injured or deformed might be effectually recovered by a little attention.

Young Plantations.—Prepare ground for new plantations, if wanted, by inclosing, trenching, or holeing. Remove any dead plants, (of which I fear there will be plenty this year,) and expose the soil to the atmosphere until the season for planting arrives.

Nursery Work.—Attend to the directions given in No. 32 of the *Chronicle.*—*W. B.*

VII.—COTTAGERS' GARDENS.

About this time, when the hues of autumn begin to make their appearance, and symptoms of the year's decline to press upon our attention, the cottager should particularly attend to neatness in everything about the garden, and endeavour to preserve the beauty of the flower-border as long as possible. Keep all plants in flower neatly tied up, and remove their flowering-stems as soon as they become unsightly; if this is properly attended to, the flower-beds, which are now in their highest state of perfection, will for some time to come amply repay the labour by their gay appearance. Dahlias, which are now coming finely in to bloom, should be occasionally supplied with liquid manure; keep them neatly tied, and see that the early ties do not pinch them. For entrapping earwigs, nothing is better than Bean stalks; place short lengths of them amongst the branches, examining them every morning, and killing the insects collected. Look over beds of Verbenas, &c., and assist them in regularly covering the space allotted for them by pegging them down on any vacancies that may yet remain to be covered. Cuttings of scarlet Pelargoniums, Verbenas, and other plants for bedding out, should, as mentioned last week, be got in as speedily as possible, in order that they may become well rooted before winter. Growing crops will require to have the soil well stirred between the rows with the hoe, not only to kill weeds, but to prepare and loosen it for being drawn to the plants as they advance in growth. Where circumstances have prevented winter Greens from being earlier put out, they may still be planted, as vacancies occur by the removal of other crops; but the sooner they are planted out now the better.—*J. M'H.*

State of the Weather near London for the week ending Aug. 22, 1844, as observed at the Horticultural Garden, Chiswick.

Aug.		Moon's Age.	Barometer. Max.	Min.	Thermometer. Max.	Min.	Mean.	Wind.	Rain.

Notices to Correspondents.

Antirrhinum.—*A. Z.*—Your seedling is a good variety, but not a new one.*

Bees.—*E. B.*—We cannot afford to this subject more space than it at present occupies, nor do we think it desirable to do so. If the information contained in our columns from time to time is not enough, you should study some such writer as Bevan on "The Honey-Bee."

Books.—*J. W. J.*—Stephens's "Book of the Farm," Loudon's "Suburban Gardener," Mackintosh's "Greenhouse and Flower Gardener," Lindley's "Theory of Horticulture."

Chrysanthemums.—*A. B.*—These will be considerably benefited by Potter's Guano if it be mixed in the soil. The quantity necessary for each plant depends much on its condition, and the size of pot in which it is grown. When a plant is in good health and growing in an 8-sized pot, which is the size generally used, 1 oz. or 1½ oz. may be mixed in the compost §

Cape Heaths.—*A Subscriber.*—The following are useful kinds, and may be easily procured, viz.—Hartnelli, pink; Aristata major, red; Acuminata longiflora, purple; Tenuiflora, white with pink shade; Inflata, white; Archeriana, scarlet; Depressa, yellow; Elegans, light purple; Cavendishii, yellow; Mutabilis, light purple; Retorta major, pink; Lamberti rosea, flesh-coloured; Hyemalis, purple, tipped with white; Tricolor, red; Linnæoides-superba, purple, with white tip; Jasminiflora alba, white: and all the varieties of Ventricosa.‡

Grapes.—*J. H.*—The proximate cause of the shanking and dropping of some of the Berries of your Muscat Grapes is doubtless an imperfect supply of nourishment. This may be owing to various causes; the border may be at present too dry, and the roots may have previously suffered from cold and wet; or the foliage may have been too scanty, or too unhealthy for contributing a due share of elaborated sap for invigorating the roots in the preceding season. ‡

Gooseberries.—*J. B. M. H.*—The following are the names of 12 of the finest flavoured:—Red Champagne, Red Warrington, Red Turkey, Keen's Seedling Warrington, Yellow Champagne, Hebburn Green Prolific, Pitmaston Greengage, White Fig, Woodward's Whitesmith, Taylor's Bright Venus, Early White, White Honey. ‡

Insects.—*Q. Q. Q.*—Your caterpillar is possibly the Noctua meticulosa; but have the goodness to tell us what mischief it was committing. Did it destroy your Carnations, and if so, in what way? *R.*——*Green-Horn.*—You should have sent us specimens. We recommend hand-picking, also your perusal of the 4th vol., p. 100, of the "Royal Agri. Journal," where the subject is discussed. *R.*——*H. A. S.*—The light-coloured aphides you will find described in the "Royal Agri. Journal," vol. iii. p. 49, but we cannot be certain of the species, as there are no winged specimens. The black ones are possibly the Aphis Fabæ, but as you do not say what Beans they are attacking, we cannot advise you as to a remedy. *R.*——*A Subscriber.*—If you will apply to any chemist, he will supply you with a liquor which will attract and destroy all your houseflies. *R.*——*G. R.*—Your grubs will change to Dilophus febrilis; we imagine they feed upon the roots of plants, but whether they will affect the health of your Pelargonium we cannot say. *R.*

Local Horticultural Societies.—*A. B. C.*—We cannot interfere. It seems injudicious: but circumstances may *possibly* render it advisable, though not probably.——*A Gardener, Dartmouth.*—We must beg you to excuse us. Anonymous discussions cannot be carried by us any further than they have gone, but must be settled on the spot. We are too far off to sift out the truth, which is, moreover, of no *public* interest.

Mandevilla suaveolens.—*A. B.*—This may be easily propagated by cuttings of young wood, either now or in spring. Insert the cuttings in silver sand, cover them with a bell-glass, and give them a little bottom-heat. §

Manures.—*A. B.*—For plants in pots, superphosphate of lime is most suitable when diluted in water at the rate of 1 ounce to 3 gallons. For Fuchsias, Pelargoniums, Chrysanthemums, &c., this may be repeated every three weeks or a month; but for others, such as Epacrises, Heaths, &c., once or twice during the season is quite sufficient. §

Melons.—*B. B.*—The Beechwood is a much-esteemed green-fleshed Melon. ‖——*M. D.*—You will doubtless find that your Melon-plants, grown above a hot-water tank, and from which the fruit is now dropping, are too dry at the roots.

Monstrosities.—*An Irishman.*—Such instances as yours are not uncommon. That in the annexed woodcut is a similar instance. They are buds assuming the appearance of Potato-tubers, and proving the latter to be gouty branches. The cause of their appearance is uncertain.

Mulberry.—*B. B.*—You must sparingly cut the roots of your Mulberry tree against a wall, just before the leaves fall in autumn. Pinch the shoots in summer, so as those near the base may have plenty of light to enable them to perfect fruit-buds. ‖

Names of Plants.—*W.*—Alstrœmeria Ligtu, and a very fine purple variety of A. pelegrina.——*Cecil.*—Not an Orchidaceous plant, but Lycopodium lepidophyllum. Your specimen is dead. The species is not known in cultivation.——*Derby.*—Psoralea pinnata.——*E. R. I. F.*—Malva Munroana.——*S. W.*—Anagallis tenella, and Ballota nigra.——*Indiana Meta.*—Lycium barbarum. For colours you must apply to the dealers in them. In flower-painting every kind of tint is occasionally required. All the advice we can give you is not to use Prussian blue, or any metallic colours.——*T. Cripps.*—Either Tropæolum minus or tuberosum.

Names of Fruits.—*A. B.*—The Apricots were too far gone when received. No. 1 only could be judged to be the Moorpark from the perforation along the edge of the stone. Plums—3, Azure Hâtive; 4, Drap d'or; 5, Fotheringham.——*A. B, Fulham.*—No. 1 appears to be the Nectarine Plum; 2, Washington. ‖—*J. B. M. H.*—Gooseberries—No. 1 appears to be Red Turkey; 2, Ironmonger, not Red Champagne; the latter grows very upright, and its fruit is more oblong and not so dark-coloured as that of the Ironmonger; 3, Ashton Seedling, same as the Red Warrington; 4, Early Sulphur; 5, Red Walnut; 6, Crystal; 7, Golden Drop; 8, Probably the Amber. ‡——*W. S.*—The Plum you found in a hedge-row, where it must have been planted, and which flowered in February, bearing abundantly, though in a bleak place and very barren soil, is the Myrobalan or Cherry Plum. Its uses have not been fully ascertained. It would probably answer for kitchen purposes. ‡——*T. L., Kilmarnock.*—Your Apple is the Scarlet Crofton, a winter Apple ‡

Pansies.—*An Irishman.*—Brown's Curion, Pearson's Black Prince, Buxton's Ne plus Ultra, Cook's Mulberry Superb, King's Sulphurea Elegans, and Magin's Bridegroom. Sow your seed immediately.*

Pear-Trees.—*B B.*—If you stop the shoots of your Pear-trees, by merely taking off the extreme points in the beginning of June, and then shorten back one half of them to 3 or 4 inches at midsummer, and the remainder to the same extent in the beginning of July, the trees will most probably soon come into a bearing state; and if they do not, as pavement prevents root-pruning, you must have recourse to ringing. ‖

Pelargoniums.—*W. J. R.*—The Pelargonium you mention, when it comes true, is one of the best in cultivation; the form, size, substance of petal, and the set of the petals when fully expanded, constitute it a first-rate flower. In colour it is fine also, but, unfortunately, there exists in the flower a strong disposition to sport. During the past season more particularly, not half the flowers were true. It is too early to answer your other question, lists of the new flowers not being yet sent out.*

The Pine Scale.—*D. R.*—We quite agree with you that if your gardener has really discovered some certain and simple remedy for this insect, he deserves to be rewarded; and we have no doubt that advertisements would procure him plenty of customers. The difficulty is to try it. The Horticultural Society does not cultivate Pines now; but the remedy would probably destroy other scales as well as that of the Pine Apple; and if so, its value would, of course, be the greater. If you wish it, we will have the experiment tried; but your own testimony would surely be sufficient to satisfy persons of the efficacy of the means employed.

Potatoes.—*A Subscriber.*—Never soak Potatoes in water before cooking them. As soon as boiled the water should be poured off, and the Potatoes set on one side of the fire to dry, before they are peeled. That is the way to have them mealy. Steaming them is a still better way. Never cover them up after they are ready to be dished up.

Sand.—*Wellensis.*—Certainly sea sand, if well washed, may be employed for all plants that do not dislike lime; but as it always contains considerable quantities of small shells, it is on that account unsuited for some things. Pit sand, although reddened by oxide of iron, is better, if well washed. Fine white pit sand is best of all; but it, too, is apt to bind if used in large quantities. Roadside sand always binds—we suppose because it is angular.

Strawberries.—*E. S.*—The distance between the rows of Strawberries should not be less than 2 feet, and from 12 to 18 inches from plant to plant in the row, according to the vigour of the variety and richness of soil. Yours being planted 9 inches apart each way, if they are Scarlets you may dispense with every other row; if Pines, every other row as well as every alternate plant in the row. ‖

Vines in a Greenhouse.—*D. G.*—As you do not wish to force the Vines in your greenhouse, no fire in winter is required on their account. Having been only planted this spring, they should be cut back to a few eyes in autumn, and not allowed to bear in the ensuing season. ‖——*J. F. C.*—The characters of the Vines you mention are not known. ‡

Miscellaneous.—*A Constant Reader.*—Keep your Caladium bicolor during winter in a pot where it gets very little water, and replace it in the tank next summer when it is beginning to shoot again; having previously got it by degrees into good growth.——*R. N.*—The sizes of flower-pots vary considerably in different parts of the country. The dimensions of the different sizes in the neighbourhood of London are given at p. 233 of the volume for 1843.‡——*W. C.*—Brachysema latifolium is a very short trailer, with deep dull crimson flowers. Kennedya or Hardenbergia Comptoniana, is a plant of great beauty, which will grow to a considerable size if permitted. A temperature of 50° is too high in winter for most greenhouse plants.——*F. D.*—We really know of no means of distinguishing correctly stove and greenhouse plants. So many species can be cultivated with more or less heat, that all positive distinction is broken down. For this reason the Horticultural Society of London has always found it necessary to allow them to be shown in the same class. The Achimenes, for example, will grow, and in considerable beauty, in a greenhouse, though it does best in a stove. Suppose a man starts it in a Cucumber frame, which he can easily do, and then transfers it to a good well-managed greenhouse, who could then say it was a stove plant? In truth, all plants that go to rest in the autumn, losing their leaves, may be cultivated in a good greenhouse, if once fairly started. Is a Balsam a stove or greenhouse plant?——*Green Horn.*—The Number you want to complete your set is out of print.——*D. C. L.*—We can hardly deal with the condition of the New Forest without a personal inspection. If we can manage it, we will pay Hampshire a visit this autumn, and, in that case, give our opinion.——*Dot's* Walnut-trees have probably been dying from their roots being in a cold wet bottom.——*Subscriber.*—We are not able at present to recommend you what new Pelargoniums to add to your collection, the lists of the new sorts not being all published.*——*A Reader of the Chronicle.*—Your specimen is a curious sport, and forms an illustration of morphology.*——*X.*—Plants of Salpiglossis should be treated as tender annuals. They should be raised in heat, and should be potted off singly into small pots as soon as the first rough leaf appears; afterwards they should be kept warm and rather moist. If allowed to grow large before they are potted or removed from the seed-pot, they are almost sure to become sickly, or die. They require a soil composed of sandy loam and a little leaf-mould; and great attention should be paid in watering them. Furze may be cut any time between November and March. Ten week Stocks may flower if the autumn is mild; but they will be worthless, as the colours always run. Keep Heaths that are just up in the seed-pots until next spring; place them in an airy and rather dry situation. Keep the bulbs of Lilium tigrinum in the pots until spring. Nos. 13 and 14 for this year may be had.¶——*A. S. Y.*—We have on several previous occasions stated all we know of the Patent Asphalte Covering; namely, that it is light and warm, tight, and will, apparently, last for some years, if properly fixed and painted. We never recommend one dealer in preference to another.

SEEDLING FLOWERS.

Calceolarias.—*W. H. M.*—Of your seedlings 10 and 11 are bright and high-coloured, the latter a self—bright-brown; the former having a rich velvety brown spot, with a margin of very bright-brown. Both these flowers are well formed, but rather flat in front. 6, cream, with large crimson spot; 1 and 3, yellow grounds with brown spots, good in general form but too flat; 7 and 8 are very pretty, but too small for the present advanced state of this flower. 10, 11, and 6 are the most desirable.*

Fuchsias.—*J. Y.*—Both your seedlings have rather coarse sepals, and the difference is too slight between the tube and corolla; they are stout bold flowers, but not equal to the best sorts cultivated.*——*W. M.*—The variety most worth preserving among the sorts sent up is No. 219; the colours are very distinct, and the form of the flower elegant; 213, which is somewhat similar in colour, is neither so bright nor so graceful in form; 220 and 227, very large, but coarse in the sepals, and not distinct in colour; 238, bad form; nor do any of the other sorts appear sufficiently novel or distinct in colour to bring out as new varieties.*——*E. B.*—Your seedling from F. splendens does not appear sufficiently novel to recommend it for general cultivation; it differs from others principally in the brightness of the tube; the foliage is rather large and heavy.*——*J. W. Vectis.*—The distinction you point out in your seedling is looked upon as a defect.*——*J. J.*—No. 1, sepals coarse, and the colours not sufficiently distinct; 2, the divisions of the corolla are too narrow—they untold and remain separate; 3, too coarse in the tube and sepals.*

Petunias.—*J. J.*—The blooms arrived in good condition. The flowers are rather coarse, and the purple appears uncertain; it too much resembles a stain of colour in the corolla.*——*Curator.*—The best and most distinct of your specimens are 2, a deep-mottled variety; 3, a clear, bright, rosy crimson; and 6, having a light ground with dark veins: 1 and 4, though good flowers, are not so much in colour; and 5, a deep, rich, mottled crimson, we have seen in other collections, but not so large; this, and No. 2, appear disposed to break into more decided colours.*

Verbenas.—*G. S.*—Your seedling, to be named *Queen of England.*—Rosy pink, with yellow eye, is a large and handsome variety.*

*** As usual, many communications have been received too late.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps: also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantage us terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London

The Agricultural Gazette.

SATURDAY, AUGUST 24, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Aug. 29 | Agricultural Imp. Soc. of Ireland.
THURSDAY, Sept. 5 Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Sept. 2 Usk. | Sept. 10 Abergavenny.

THE condition of AGRICULTURAL MECHANICS in a country is the best possible criterion by which to estimate the character of its cultivation—for this must be carried to a high pitch before a demand can exist for well-constructed and efficient, but necessarily expensive implements; and thus the improvement which has of late years taken place in British Agriculture is in nothing more satisfactorily apparent than in the superiority of our present farm implements over those formerly in use. Scarifiers and cultivators have now, for many purposes, taken the place of the tedious plough; drilling-machines, as well as machines for scattering seed broadcast, have taken the place of manual labour; the threshing-machine has been substituted for the flail; and chaff-cutters and Turnip-cutters are generally used where such implements were formerly unknown.

Although these substitutions have not all been effected within the last few years, yet any one who has had the opportunity of attending the Annual Meetings of the English Agricultural Society, and of comparing the implements there exhibited from year to year, must acknowledge that great improvements have taken place in the Mechanics of Agriculture even within the still short period of that Society's existence. Speaking of the exhibition of implements at Derby in 1843, the Editor of the *Gardeners' Chronicle* last year made the following observations:—"The most rapid strides have been made in this department. The show of implements at Oxford was not very good; nothing very new or perfect was exhibited there. At Cambridge it was much better; Liverpool and Bristol surpassed the preceding; and at Derby there was the greatest collection of every kind of implement—from the simple plough to the portable steam-engine—which had ever been brought into one spot. For three days we spent many hours delightfully in following the new inventions and the improvements pointed out by the different makers; and many more days would have been required to notice all that was worth the attention of the agricultural mechanician."

Our Report some weeks ago of the Exhibition at Southampton shows how far this rapid progress of improvement has been sustained.

Those who have been unable to visit the show-yards of the Society at its Annual Meetings may easily estimate the extent of this improvement by comparing the works which have been published on the subject. The latest of these, that by Mr. J. Allen Ransome, of Ipswich, is incomparably the best that has appeared; it is descriptive of a greater variety of better implements than any of its predecessors, and it exhibits a thorough acquaintance with the principles on which the efficiency of the different machines depends. We shall have opportunity, in the course of future Articles on Agricultural Mechanics, of noticing Mr. Ransome's opinions on various farm implements; and it is therefore unnecessary at present to refer particularly to his descriptions of them. In illustration, however, of the improvement in them to which we have been alluding, we take the liberty of extracting the following remarks on their condition centuries ago:—

"In our own island, ploughs were, during the early and dark ages of its history, rudely constructed, intolerably heavy, and of all kinds of shapes; a result which might have been reasonably anticipated, for by an old British law, every ploughman was required to make his own plough. The harrows, and other agricultural implements, were equally ill-shaped. Drills were utterly unknown until about the sixteenth century; and when, about the year 1730, the celebrated Jethro Tull endeavoured to banish the flail from the barn, his neighbours loaded him with execrations. The tradition of the neighbourhood of Prosperous Farm, near Hungerford, which Tull cultivated, still is, that he was 'wicked enough to construct a machine, which, by working a set of sticks, beat out the Corn without manual labour.' This is the first traditionary notice of a threshing-machine with which I am acquainted."

The chapter on threshing-machines in this work—one of the best in the book—details the successive steps in their improvement since that period. We shall endeavour hereafter to describe, and fairly to estimate, the value of the various farm-implements now used, in the condition to which they have been brought by that process of improvement to which we have been alluding; and we are glad to be able to say, that in preparing these descriptions, and in forming these estimates, we have been promised the assistance of many eminent manufacturers—that of Mr. Ransome, among others.

WE have been asked by a correspondent if the practice suggested by Mr. Hannam, and detailed in a late Number of this Paper, on the subject of HARVESTING GRAIN CROPS, is applicable to Barley and Oats, as well as Wheat.

In the latter case this point has been already determined by almost universal practice—upon other grounds, however, than those indicated by Mr. Hannam's experiments. Oats are generally cut before their straw has lost its green colour, simply because, when left till quite ripe, they are very liable to shed their seed, its attachment to the stem being much slighter than that either of Wheat or Barley. Most probably, however, this practice is productive here, as well as in the case of Wheat, of a better quality of grain than we should otherwise be able to grow.

With reference to Barley, again, the almost universal practice is to let it remain on the field till it is dead ripe. Whether this practice be correct or not, Mr. Hannam's experiments cannot, we think, be held to condemn it; they only determined the influence which the time of harvesting grain exerted on its quality *as food*. Barley being generally grown for malting, is seed to be sprouted, not grain to be eaten; and there is but little in the experiments to which we allude to indicate the effect of early or late cutting on the quality of grain *as seed*. On this subject Nature is as yet our only guide, and if it be safe to follow her, farmers are certainly right in permitting Barley to become thoroughly ripe before cutting it, for seed is naturally never shed or sown till dead ripe.

The practice, however, of permitting Barley to remain on the field till thoroughly ripe, has not, we believe, arisen from any notion of the propriety of imitating Nature in the matter, but from the circumstance that it is of importance in malting grain that it should all sprout together, so that the process may take place fully within the time allotted for it; and it is probable that the evenness of sample which is thus so essential in malting Barley can only be obtained by ripening it thoroughly. The only way to obtain grain all of the same stage of ripeness is to make it all dead ripe.

Whether, if it were possible, with our variable soil and irregularly sheltered fields, to cut the crop all in one stage of growth before it became thoroughly white, the quality of the grain for malting purposes would thereby be improved, remains an unanswered question.

GEO-AGRICULTURAL NOTES ON SOUTH GLOUCESTERSHIRE.

(*Continued from page 562*).

Fullers' Earth.—Below the Bathstone lies a bed of clay, from 40 to 50 feet in thickness, in which, near Bath, the fullers' earth is found. This bed crops out below the limestone rock, under which it lies, and its course, dependent as it is on the windings of the hills and valleys, is most tortuous. It is, however, easily traceable along the lower edge of the Bath-stone. This bed of clay is generally of a yellow colour; and near and beyond Bath the fullers'-earth occurs in it in isolated masses, in search of which pits are dug at random. It throws out a great many springs; many streams take their rise from above it.

Agricultural Character of the Fullers' Earth.—The surface of the narrow band in which this bed of clay is exposed is most irregular. It may be easily traced at a distance by the contrast in this respect which it presents to the surface of the ground on either side of it. This unevenness is sometimes owing to the occurrence here and there of masses of debris, which have fallen from the rock above, but may be more generally due to the wide cracks made in the clay during the summer, and to the slight slips which consequently take place on the fall of rain. This bed of clay is of very little consequence in an agricultural point of view; it is not only of very little extent, being a mere band, but is steep, being situated on the side of the hills. It is almost wholly in pasture, and this pasture is of the poorest description. When left to itself, as in commons, it becomes covered with the Bramble, the Sloe, and the Briar, which are characteristic of clayey land in general. When arable the soil is very stiff and clayey. It is well seen at the top of a row of fields immediately below the road into Bath, as it winds along the edge of Charney Down. The soil is there a dark (nearly black) stiff clay, forming a narrow band along the upper edge of the fields, which are chiefly of a brashy soil, of a ruddy brown colour, overlying the rock of the inferior oolite. It is adapted for the growth of Wheat and Beans, but, in the few instances in which it is arable, it usually forms, as in the case just cited, merely a portion of fields, including both it and the soil on the rock below it, and thus seldom receives a cultivation peculiar to itself, only taking part in that of the whole field. Now, as the soil both on the inferior and the upper oolite, the one immediately below, and the other immediately above the clay of the fullers' earth, is of a brashy nature, and peculiarly a Barley soil, it is evident that the soil on the clay between them, receiving the same kind of cultivation as they do, can seldom be cropped and cultivated in a manner suited to it. It is only when a crop of Wheat is taken that this is the case, and even then it does not show that superiority as a Wheat soil that might be expected, being so wet that crops of no kind will succeed on it till it is drained. The clay of the fullers' earth, when it thins out on the inferior oolite below it, does not appear to produce that improvement which might be expected to follow the mixture of soils of such opposite characters. This is perhaps owing to the extreme wetness of the land during six or eight months in the year, the whole of the rain falling on the upper oolite being turned out by the clay, over the surface of which it runs until it meets the rock of the lower oolite, through which it sinks.

Inferior Oolite.—The member of the oolitic series upon which, in the descending order, we next come, is the inferior oolite. This consists of two beds, the upper a limestone rock, and the lower a calcareous sand. This rock comes out to the surface all along the edge of the hills, as will be seen by a reference to any geological map of the district. This limestone has much more of the oolitic structure than the upper limestone of the series. It is a softer rock, capable of being worked with the saw as well as the chisel, and is more easily worked for ornamental purposes. It does not, however, stand the weather well. The whitest and finest stone is found in the lower beds of this rock, the impurity of the limestone, owing to the presence of clay, increasing upwards. The uppermost bed, which varies from 20 to 30 feet in thickness, contains as much clay as lime. This top bed consists chiefly of large concretions of shells; it gets the name of *Rag-stone*. The lowest bed of this rock, that, resting on the sand, differs from the rest of it in not being much affected by the weather, is a weather-stone, and accordingly, in quarries and other sections, where both are exposed, it projects uninjured from the midst of the debris produced by the action of the weather on the rock above. This bed does not exceed two or three feet in thickness. Below the limestone rock, and of about equal thickness with it, occurs a bed of calcareous sand, generally of a yellow colour. This sand, in the neighbourhood of Wotton-under-edge, is ferruginous in a high degree, and presents a curious oolitic appearance, which is not common to it. There are also concretions and hardened masses occurring in the midst of it, generally in layers. These are provincially termed *Sand-bats*. They are owing either to a more indurated state of the sand, or to the presence in abundance of shells, of which generally there are but few.

Agricultural Character of the Inferior Oolite.—The soil on the lower oolite is of two kinds; that on the limestone rock necessarily differs from that on the sand. The one is very shallow, full of fragments of rock, and of a brown or ruddy-brown colour; while the other is a light sandy soil, partaking more or less of the yellow colour of the subsoil, according to the degree of cultivation it may have received. The stony brashy soil on the rock is generally situated on the steepest part of the hill-side; and being thus too steep for arable land, and too shallow for good pasture land, it is generally covered with wood. The Beech is the tree natural to the thin calcareous soil occurring on this rock. The valleys of Hawksbury, Wotton-under-edge, and Waterleigh, and a great part of the valleys of Ozzleworth and Uley, are thus surrounded by wood. This is the case very generally along the whole of the oolitic escarpment, and some of the finest Beech woods in the kingdom are to be found here.

Where the land is arable, the practice of the farmers varies very much. Some take successive crops of Wheat and Potatoes, and thus sell everything off the land; others take Wheat, Potatoes, Barley, and fallow or seeds or Turnips, in succession; but whatever the principle be, if there be any which they adopt, whether it be good or bad, the mode in which they carry it into practice and follow out the details of cultivation is slovenly. This is attested by the foul state of the land. The Barley and Wheat crops are, during the spring months, buried in Charlock, the wild Mustard, and a hundred other weeds.

The slovenly state in which this land is generally to be seen is, perhaps, owing to its being let in small farms, and to the practice of sub-letting, which is common, especially when the Potato crop comes round. To this, however, though it is general, there are exceptions. Even a bad system may, in the hands of an active farmer, be made the means of cultivating his land well. The soil on the sand is of a much more valuable kind than that on the rock. Where both exist in their natural state, as in the many commons occurring on this rock, a shower of rain, after a long drought, will enable one to trace to an inch the junction between the two; the Grass on the sandy soil becomes as green as the contrast which it presents to the withered herbage on the brashy soil can make it. The soil on the sand is chiefly in pasture, and some of the richest pasturage in the county is to be obtained on it; whoever has witnessed the freshness and richness of the verdure which the many beautiful valleys intersecting these strata present to the eye after a genial rain, will not doubt this. It also forms good arable land; and where this is flat, as in the case of Mr. Dimmery's farm at Stinchcombe, a report of which by Mr. Morton appeared in the first

volume of the Society's Journal, the land is most valuable. When situated on the hill-side, it is necessarily not so well suited for arable land; and in consequence of the continued practice of ploughing down hill, the tops of many of the fields thus situated have the soil entirely removed from them, and expose the yellow sand of the subsoil; this renders them still less valuable as arable land.

It is on this soil, in the Nailsworth Valley, that the only water-meadows occur that are to be found in our district. The following statement, with which the proprietor of these meadows favoured me, of the expenses and returns of irrigation in this particular instance, shows most conspicuously the advantage of the operation:—The extent of the meadows is about 15 acres. Before being irrigated they were valued at prices varying from 10*s.* to 3*l.* per acre, and averaging about 30*s.* In its original state the land rotted sheep, and was therefore unsafe, except to put fat sheep on just before going to the butcher. The expense of building bridges, laying out and digging the water-courses, &c., in fact the whole expense of irrigation, amounted to about 15*l.* per acre. This is higher than is the case in many instances, owing to the number of bridges and aqueducts rendered necessary by the narrowness of the valley. The annual expense, including repairing the hatches, clearing out the water-courses, &c., amounts to 15*s.* per acre; to this is to be added 15*s.* as the expense of harvesting the hay crop. The return from this outlay is in the form of a greatly increased value of spring and autumn feed, and also in the entire destruction of any tendency in the land to rot sheep. The meadows are generally shut up during the first week in May, and the crop is cut in less than two months; it averages 35 cwt. If it were allowed to grow three weeks longer, it would probably average 45 cwt. per acre; but this would be at the expense of a deterioration in the quality of the hay and in the value of the latter-math. The value of the early spring feed till May, and the autumn feed till December, is estimated at 2*l.* per acre. The following, then, is a statement of the profits per acre, per annum, arising from irrigation, in this instance:—

Dr. Cash.	£	s.	d.	Contra. Cr.	£	s.	d.
To 35 cwt. of Hay, at 60*s.* a ton . .	5	5	0	By former value of the land per acre .	1	10	0
To value of spring and autumn feed .	2	0	0	By 5 per cent. on outlay of 15*l.* per acre	0	15	0
				By annual expense of irrigation . .	0	15	0
				By annual expense of harvesting Hay .	0	15	0
				Balance — profit per acre . . .	3	10	0
	£7	5	0		£7	5	0

To this is to be added the immense advantage to the farmer of being able to carry the crop off the land each year without injuring it. The manure arising from the consumption of the Hay-crop thus goes to enrich the fields of an arable farm in the neighbourhood. The good done by irrigation in this instance does not seem to be owing to the deposition of any soapy or oily matter which the water may occasionally contain from having passed through the mills higher up the valley. In an instance of a water-meadow at Longfords, one of a series possessed by the proprietor of those just alluded to, there were two descriptions of water employed: the one contained the washings and sweepings, &c., of the streets of Minchinhampton, the market town in the neighbourhood, and the other was brought directly from a spring close to the field; the beneficial effects of irrigation were greatly more manifest in that part of the field over which the pure spring-water * was used than in that watered by the washings of Minchinhampton. This is certainly not the result which would have been expected, and it shows that land is benefited by the process, not so much by the deposition of sediment, as by the protection given to it during the frosts of winter.—*M. S.*

ON THE APPLICATION OF MANURES.

In former communications I expressed an opinion that the main uses of the roots of a plant were two-fold; the one to fix itself in the ground, the other to seek water. It is in search of water, and of that alone, that the young root in the first instance descends into the earth: did it seek other nutriments, it would rather remain near the surface, where such matters abound. But that Providence, which always works by the simplest means, where simple means are sufficient for the end, has by this one attraction made the root, by fixing it in the ground, a holdfast also for the fabric over head. The plant has no foresight of the necessity of securing itself in its position, but impelled by this powerful attraction to supply itself with the water necessary for the growth of its stem, its radicle shoots several inches into the soil to insure a supply; and before the plumule raises its head to seek the light of heaven, it has thus firmly established its hold on the earth. Does the existence of the attractive influence of water require illustration? A root has been uncovered, a wet sponge placed near it in a direction different from that in which the root was proceeding, the root soon altered its position, and turned towards the sponge. The attractive power of water may be exemplified in other actions than in those on the roots of plants:—When a wet sponge is held under the leaves of a tree, they bend down in order to touch it. If a vessel of water be put within six inches of a growing Cucumber plant, in less than twenty-four hours the latter will alter its direction; the branches will bend towards the water, and never alter their course until they come in contact with it. Any root, not naturally fibrous, will become so if exposed to the action of running water. It thus increases its mouths, and the necessity no longer exists of striking its roots deeper into the soil. Liebig states, "Fruits, leaves, seeds, nearly every part of the plants of a former world, except the roots, are found in the brown coal formations." In that age of the world, when the alluvial formation of these layers took place, the surface must have been so moist as to preclude the necessity of plants sending their roots deep into the earth in quest of water; the roots were small and fibrous on that account, and not because of deficiency of carbon in the soil, as assumed by Liebig.

But it may be asked, Does not the same cause act on the plumule? I would say no; or rather, that it is counteracted by an opposite and stronger attraction, to which the plumule is by its nature more subject. It is the attraction of light, and light alone, (not heat, for the surface of the earth is warmer than at any distance from it) that compels the stem to rise into the air; it has no need to seek water, but it requires for all its purposes light; and by it the stem is brought into the region where all that is further necessary for the support of the plant is to be found—the gases of the atmosphere and the various effluvia which exhale from organic matters in a state of decay on the surface of the earth, or buried skin-deep within her bosom. That light has an attraction powerful enough thus to make the plant shoot upwards is a matter of every-day observation; the Pelargonium in the cottager's window sends out its branches to the light of day; it extends them not into the darker, though by many degrees warmer, recesses of the chamber. A very strong and curious proof of the attractive power of light offered itself to me in 1827, at Feahle, in the county of Clare. To ascertain the effect of certain steeps, I had sown some Oats in a small room into which the light was admitted by a single pane of glass; the stems tended in direct lines to this pane; but there happened to be a stone about 6 inches high in the direct line between the pane and some of them; all the stems so situated declined from the right line to the pane, from the perpendicular, and from the stone, and took such a direction as to strike the ray of light that proceeded from the pane over the stone at right angles; that is, they took the shortest possible line to arrive at the ray of light, and on reaching it, curved directly towards the pane. When seeds are sown too thickly, the plants are drawn up, according to the popular phrase—they are drawn up by the attraction of light; on the contrary, when the seeds are sown thinly, and light is admitted around the plants, they spread out and become branchy.

But requisite as the presence of light is to the growth of the stem, it is probable that its absence is as favourable to the growth of the root; there has long been a cherished opinion of the working-gardeners and farmers in favour of sowing seeds in "the darks," that is, when the moon reflects not the light of the sun (she does not reflect his heat). Martin Doyle cites (though he smiles at it) the authority of a Wexford gardener for sowing his Cauliflower-seed when the nights are dark in the month of May. We are too generally prone to scepticism when the extent of our reason falls short of the depths either of Revelation or Nature; it is not impossible that popular belief may be here, as it frequently is, better founded than we are disposed to admit. Whether the absence of light be favourable or not to the germination of the root, as the dark nights are probably passed away when the plumule is fit to be acted on by light, the moon's full lustre may serve the plants essentially in this their early, and it may be their more susceptible period of growth. —*J. M. Goodiffe, Revenue Police, Granard, Ireland.*

ON SWING AND WHEEL-PLOUGHS.

It is evident that the wheel has been an addition to the simple original form of the plough. Whoever added it did so, no doubt, with a view to its improvement; probably in order to assist his own imperfect management of it. Again, there is no doubt but that an implement is perfect in proportion as its work is independent of the skill of him who manages it. Upon this fact, those who prefer the wheel-plough found their first argument in its favour. They say that it requires less skill for its management than the swing-plough does—that a boy may guide it. This is, doubtless, true. They say, in the second place, that the draught of the swing-plough is greater than that of the wheel-plough. This point, however, has not been so definitively settled by experiment, but that it will be fair to give the arguments of the opponents of the wheel-ploughs on the point. These shall be stated in their place: in the mean time, it may be said that, supposing the two implements to be guided each by a man of ordinary skill, the draught of the wheel-plough will at any rate be more uniform, and so far, easier to the horses. They state, in the third place, that the depth of the furrow is by this plough preserved constant and uniform, and is not liable to that irregularity which marks the unskilful ploughman. These, so far as I know, are all the arguments used by the wheel ploughmen. They are answered as follows:—To the second one, it is said that the draught of the wheel-plough may be less in particular instances than that of the swing-plough; but it is not so as a general rule. The plough may be so regulated as to "swim fair," though it be a swing-plough, so that by merely holding it in an upright position it will work at a constant depth. If the plough does not swim fair, all the effort to keep it in its place comes upon the ploughman, whose labour is thus increased, so much so, that he will not hesitate at once to proceed shifting the various means of adjustment, till he gets the implement to work properly. In the case of the wheel plough, on the other hand, the plough may not be properly adjusted; but it will, nevertheless, keep to its depth, being hindered from going in by the wheels, which thus hinder that inconvenience for the ploughman to which in the other case he was subjected; and he therefore continues working it in that state, and will not alter it, though it should so much dip in as to jerk forward, as if it were running on tiptoe. In the one case the horses are sure of being properly treated, for their comfort depends upon the very same circumstances as that of the workman, while in the other the horses must suffer from the increase in the amount and in the irregularity of the draught, because the comfort of the man is untouched by that increase. With respect to the third argument, its force is acknowledged upon level land; but the very thing which insures uniformity of depth in ploughing level land will, it must be remembered, increase the irregularity of this point in the case of uneven land.

The truth of the first argument in favour of the wheel-plough is acknowledged; but its force is questioned, and I think with justice, when we look at the agricultural character of the districts into which it is admitted, and at that of those where it is not used. It is urged that the implement which performs its work in a passable way, independently of any attention bestowed on it by the workman, is not necessarily on that account to be considered a good one, for this reason, that it tends to produce carelessness in the workman; and, therefore, that the use of the wheel-plough tends to deteriorate the class of agricultural labourers as regards their skill, their industry, and activity. It will not do to say that we can employ boys instead of men with the wheel-plough; many practical men will acknowledge, to a considerable extent, the truth of the remark made by a practical farmer on this subject—that for each boy he had on his farm he was forced to keep a man to look after him.

I perceive, however, that notwithstanding my attempt to state simply the opinion of the two parties, and then judge between them, I have already expressed my own opinions on the subject. It is possible that a spot so level, and workmen so careful and attentive may be obtained, that the wheel-plough may be superior for its cultivation to the swing-plough; but for general purposes I certainly believe the swing-plough to be the superior implement. There is one advantage which it has over the wheel-plough, viz., that there are few soils which are not ready for ploughing, and which may not be ploughed by the swing-plough, before the farmer could get on it with the wheel-plough, for the wheel clogs with the wet earth, and thus not only is a continual hindrance to the operation, but by getting an increase, in the shape of earth, to its circumference, the depth at which the implement works is variable.

The wheel-plough is also objectionable as an invasion of the original simplicity of the implement, and it certainly is so in some of the monstrous forms which it assumes—that, for instance, of the old Berkshire plough. —*M.*

ON MINERAL AND INORGANIC MANURES.

No. XXIV.

By Professor Charles Sprengel.

The ashes of most herbaceous plants have a greater value than those of wood, being richer in several important salts. The analysis of Rape straw will serve as a sample. 100,000 parts of the ashes of Rape straw contain.

2,065	parts of	silica.
2,323	,,	alumina. oxide of iron. oxide of manganese.
16,912	,,	lime.
3,100	,,	magnesia.
18,800	,,	potash, partly combined with silica.
11,210	,,	soda.
13,340	,,	sulphates of lime and potash.
9,900	,,	phosphate of lime.
11,350	,,	chloride of sodium.
11,000	,,	carbonates of lime, potash, and magnesia.
100,000	parts.	

If, therefore, an acre is manured with 1000 lbs. of ashes of Rape straw, the soil will receive 169 lbs. lime, 188 lbs. potash, 112 lbs. soda, 133 lbs. sulphuric acid, 99 lbs. phosphoric acid, and 113 lbs. chlorine; and thus it appears that its effects will be greater than those of wood-ashes. The ashes of Rape straw, however, are not the richest in saline matter: they are surpassed in that respect by those of Maize and Bean straw, the herbage of Potatoes, and the stems of Tobacco. In order to manure with Rape, it is best to spread the straw thickly over the field, and to set it on fire. The heat will act beneficially on the soil, and kill also all vermin; on which account the result of this operation is always very productive.

Most people believe that the ashes of wood and herbaceous plants improve vegetation only by neutralising the acid (humic acid) contained in the soil, or by bringing the coal of humus to decomposition; this is, however, a mistaken idea. The carbonates of potash, lime, and magnesia, which alone could accomplish this, do not occur in it in that quantity which would enable them to act powerfully: thus, 200 lbs. of potash neutralise only 800 lbs. of humic acid; 200 lbs. of lime no more than 2000 lbs.; and 100 lbs. magnesia only 900 lbs. Consequently, the whole of the carbonic salts contained in 1000 lbs. of ashes, neutralise only 3700 lbs. of humic acid; whilst the furrow-slice of an acre on which these

* It should be stated that the spring water was highly impregnated with the carbonate of lime.

1000 lbs. of ashes have been used, contains at times 50,000 lbs. of humic acid. I manured one acre of a heathy soil, containing very much free humic acid, with 1400 lbs. of Beech ashes, and found—as it could not be expected otherwise—that after the lapse of one, two, and three years, it acted upon chemical tests in the same way as previously; but as, notwithstanding, it produced very fine Oats, Clover, and Potatoes, there is good reason to assume that the ashes nourished the plants, which is the more probable, as we always find them as a component part of crops which have been grown after ashes have been employed. Besides, if it were not the salts of ashes which improve and nourish plants, why should they not be all equally beneficial? We always see that those ashes manure best which are rich in gypsum, phosphate of lime, common salt, and sulphate of potash; and as these salts do not act on the humus of the soil, it is evident that they directly nourish the plants. The silica, alumina, and the oxides of iron and manganese contained in ashes, must not be considered useless; because, though the soil contains a sufficient quantity of these substances, they are not contained in it in such fine particles as in ashes. Silica, especially, may serve the plants as food, the more so, as it is at times combined with potash in such a proportion as to become soluble in water, which also may be the reason why Oats, which are most rich in silica, succeed mostly after ashes.

If ashes are used to the amount of 500 or 600 lbs. per Magdeburg acre, this palpable effect will last only two or three years; as the easily soluble salts are not so much absorbed by the plants as they are extracted by rain. The substances which are hardly soluble in water, like phosphate of lime, carbonate of lime, &c., remain longer in the soil; but this quantity is too small for them to assist vegetation to any great extent. The quantity of ashes used at one time ought not, however, to be too great, else the plants, instead of being improved by the easily soluble salts, will be injured, and a great waste of the salts will take place by rain-water. It is, therefore, always better to use repeated manurings with ashes in small quantities, and this ought to be the general rule with all manures containing many substances easily soluble in water. Clayey soils, however, require always a greater quantity of ashes than sandy soils, and it will not be too much to use 1000 lbs. to 1200 lbs. on one acre of the former, the greater or lesser amount being determined by the proportion of potash they contain. Soils very rich in humus require also much ashes, as in this case a part of the superabundant humic acid is to be neutralised. Fresh ashes will avail such soils chiefly by supplying them with the deficient potash, and it is obvious that those ashes will be preferable which contain most of this alkali. In order to spread ashes well they should be somewhat wetted, and either strewed on the surface in calm weather, or harrowed in with the seed. Generally speaking, in order that the carbonate of potash may not be hurtful to plants, it must be first changed into humate of potash. If, therefore, a soil contains little humic acid, the quantity of ashes used must be very small, and whoever takes no care of this will injure his fields by ashes, rather than improve them.

The manuring with fresh ashes in the neighbourhood of large towns is, comparatively speaking, not very expensive, as we can buy the ashes here at the rate of two-thirds of a dollar per 100 lbs.; if, therefore, even 1000 lbs. should be used per acre, it would only amount to six and two-thirds dollars per acre. We have also constantly to bear in mind, that the constituent parts of the ashes which are absorbed by the plants are soon again returned to the soil in the shape of dung, as only a small portion thereof is retained in the bodies of the cattle. By manuring with ashes the soil is therefore improved for many years to come. It is to be understood that ashes must be kept in a place well protected from rain, else they would soon lose their powerful ingredients.

Experience has shown that vegetable ashes will chiefly improve the growth of leguminous plants, as Lucerne, Clover, Peas, Vetches, &c., which is easily explained by all plants belonging to that family requiring much soda, potash, sulphuric and phosphoric acids, lime and magnesia, and chlorine, for their nourishment, large quantities of these substances being found in their ashes. If wood-ashes are strewed over meadows which produce bad Grasses and Moss, the effect is the appearance, as if by enchantment, of a variety of Vetches and Clovers springing up. On meadows exposed to inundation, ashes cannot be used, any more than upon very wet fields. All plants grown after manuring with wood-ashes are not only much relished by cattle, but are also very nutritious, because they then contain also those mineral substances in great quantity, which are required for the chemical constitution of animal bodies; potash, lime, soda, and magnesia, will also saturate the vegetable acids, and contribute (as has been shown under the head of Marl) towards the forming of much albumen, sugar, and other nutritious substances. Ashes from potash-boilers, bleacheries, and soap-boilers, are used even more than fresh ashes, being much cheaper.

As these extracted ashes will contain but traces of potash, common salt, and other saline matters, easily soluble in water, and will also have lost much of the gypsum they formerly contained; they will never act so powerfully as fresh wood ashes, on which account large quantities are always to be used—nay, two or three tons will not be too much per acre. In this case their effect will last many years, which might naturally be expected, as in 4000lbs. of ashes, at times 480lbs. of phosphate of lime, and more than 2000lbs. carbonate of lime will be met with. At times, extracted ashes are mixed previous to being used with burnt lime, which will increase their manuring properties. Clayey soils, if manured with a considerable quantity of such ashes, will be much loosened, and be more benefited, generally speaking, than light ones. Fields, which even after a manure of gypsum, did not bear Clover, will produce it most luxuriantly, after a manure of these ashes; and as Peas, Vetches, and Beans, will also prosper, this can be taken as a proof that they act chiefly by the phosphate of lime they contain. Amongst the crops growing best after a manuring of extracted ashes, are Oats, most probably because these ashes always contain still some potash, and much of a silica, which will dissolve easier in water than that of the soil. Rape, Potatoes, Barley, and Flax, will succeed equally well, but ashes will act most strikingly, only if the soil contains plenty of humus, as the humic acid thence arising has to dissolve the phosphates of lime, magnesia, &c., and to convey them to the plants. Their effects are altogether similar to those of marl, which is caused by both being very similar in their chemical composition. It is at times said, that extracted ashes will act equally powerfully with fresh ones, but this (provided equal quantities be taken of either), is only the case when the soil is not naturally deficient in those substances, which the ashes have lost by extraction.

Generally the ashes are harrowed in with the seed, or ploughed in very shallow; they must, however, be always well spread, because if they lie too thick on any spot, nothing at all will grow there.

Home Correspondence.

Liquid Manure.—Permit me to call the attention of your readers to a cheap and efficacious manure, now to be obtained in most of our towns, and at the same time to suggest a mode of rendering it more extensively available—I mean the ammoniacal refuse liquor from gas works. This is not unfrequently considered almost a nuisance, and I have known it a practice at some works to burn weekly the contents of the vessels in which it is received; while at a trifling expense the gas company might convert it into a valuable chemical manure, and it would thus become in their hands an article of profit. My own experience enables me to testify to its value in what I may call its unmanufactured state—namely, the liquor as received from the works. I have found it to contain, when freshly drawn, 75 per cent. of pure ammonia (!) and, applied undiluted, it has immediately destroyed all herbage from a plot of sward chosen for the experiment; in various dilutions it has injured or improved; but I consider a dilution with six times its own weight of water gives it practically a sufficient strength. Having received the fresh liquor in casks, and allowed 24 hours for the tar to sink, I then by a syphon draw off the fluid, one portion going, after dilution, at once to the fields, and another being thrown into the dung-yard and tank. The price charged me by the Aylesbury Gas Company is three farthings per gallon, and the tar may be worth one-fifth of that sum. The next point is the conversion of this ammoniacal liquor into a fixed salt. This I have effected with gypsum and various sulphates, and with common salt (muriate of soda); also with sulphuric and muriatic acids; on the ground, however, of superior efficacy and cheapness, the whole becoming by the combination a useful product, as well as on account of the greater certainty in its use, sulphuric acid is to be preferred. In this lies what I before indicated—a resource for gas companies. With their furnaces in action it is manifest that a very small expenditure of sulphuric acid would enable them to convert the refuse they now hardly know how to get rid of into a cheap efficacious manure—sulphate of ammonia. And until this is done on a large scale, the liquor offers to the agriculturist a valuable and ready auxiliary—it is ammonia in solution Your Papers on "Liquid Manure" specify several applicable preparations, and give their *rationale*. I will not, therefore, occupy your *Gazette* by more than this reference to the subject as worthy attention.—*B. L., Highbury Grange.* [Unquestionably this liquor contains much ammonia capable of being put to important agricultural uses; but our correspondent is surely in error in saying that he met with a sample containing 75 per cent. of it.]

Winter Food for Dairy Cows.—Observing in an article on this subject, by Mr. Steele, of Epsom, that Potatoes are recommended, I think some of your readers may be benefited by the knowledge of my experience with them as food for cattle. I have given them in the winter with hay to cows, and straw to young cattle, with the greatest success; the latter, when fed with them, always being in good condition, and the former thriving well and giving a fair quantity of very sweet milk, producing butter of good flavour. Thus far I merely corroborate the statement of Mr. Steele; but the fact to which I wish to draw the attention of your readers is, that when Potatoes are given to cattle late in the spring, with green food, they are liable to become hoven or blown. Two years ago, having a quantity of these roots when they were at a very low price in this neighbourhood, I began to give them to my cows when turned out at Grass, and the consequence was they were all blown to an alarming extent. I have always used the Potatoes raw, but most probably had they been steamed the evil in this case would have been avoided; still I do not approve of steaming roots generally for cattle, because, as far as I have had the opportunity of ascertaining, they do better on them raw. In this case I did not lose any of my cows, but had I not taken prompt measures for their relief, there is every probability that a fatal result would have ensued. Not having a probang at hand, I had them copiously bled, and drenched with three quarters of a pound of common salt each, in two quarts of water, and in the course of a few hours the swelling had entirely subsided. When cattle are hoven I much approve of bleeding, because, even when the probang has been effectually used, the loss of some blood is advisable, in order to check any inflammation caused by excessive distention of the stomach.—*Arthur Hall.*

Analysis of Guano.—The present Number of the Journal of the Agricultural Society of England contains an elaborate analysis of guano, by Dr. Ure, such as no ordinary chemist in a country town could be expected to execute. The African and Peruvian guanos are shown to be entirely distinct (agriculturally speaking), and no farmer ought to order guano without specifying which kind he means to purchase—the qualities of the latter being greatly superior to those of the former, as Dr. Ure (page 302-3), expressly states:—"Among the many samples of African guano, I have analysed for the importer, none has contained any appreciable quantity of uric acid, or of consequence potential ammonia." In page 303 he proceeds to the Peruvian and Bolivian guanos, and explains what he means by potential ammonia. "My attention has been directed not only to the constituents of guano, which act as immediate manure, but to those which are admitted to impart durable fertility to the ground." Ammonia is the chief thing; "yet not altogether in the pure or saline form, for it is too readily evaporated and washed away, but in the dormant, or, as one may say, the potential condition. Genuine Peruvian and Bolivian guano surpass very far all other species of manure in the quantity of potential ammonia, and therefore in the permanency of their action on the roots of plants; while in consequence of the ample store of actual ammonia they contain, they are qualified to give immediate vigour to vegetation. Urate of ammonia constitutes a considerable portion of the azotised organic matter in well preserved guano, (he is speaking of Bolivian and Peruvian). It is nearly insoluble in water, not at all volatile, and is capable of yielding to the soil, by its gradual decomposition, nearly one-third of its weight of ammonia." We may observe, that though there may or may not be as large a proportion of free ammonia, upon which the first year's crop chiefly depends, in the African, as in the Bolivian and Peruvian guano, yet that the two latter exclusively possess that combination of uric acid and ammonia which gives the invaluable power of producing enduring fertility in subsequent years. The true criterion, then, of the excellence of guano is the quantity of uric acid it contains, by means of which it retains, and gradually gives out, a continued stream, as it were, of ammonia. The specific gravity of a decoction of guano will not indicate its value, because this most important ingredient is nearly insoluble. To obtain detailed analysis in the country is quite impossible, or if possible, unnecessary; because it is sufficient for us as buyers to know the existence and perhaps proximate quantity of one ingredient, namely, uric acid, which does not exist at all in the inferior guanos. The test of this ingredient, to be practically and generally useful, should be contained in a little bottle in the pocket, be easily applied, and the effect decidedly and immediately obvious to a farmer's senses. It need not indicate the proportion accurately, but it should proximately. The Royal British Association could not do better than offer a premium, or set their consulting chemist, Dr. Lyon Playfair, of Manchester, to work. But great bodies move slowly; and, considering your influential position, I think a subscription, under your auspices, would soon raise a sufficient sum for the purpose.—*John Guanophil.*

Cambridge Red Wheat.—I inclose an ear of Wheat for your inspection, as a sample—one fairly selected from the produce of an acre, which was dibbled late in the spring by hand, in rows of 1 foot and 9 inches between the dibblings. The acre took but one peck and a pint of seed, was sown very late, and in its earliest stage suffered much from drought. From an ear gathered at the same time as the inclosed I have extracted 106 perfect grains. I am not enabled to give you the name of this variety; all I know of its origin is that it was called Cambridgeshire Wheat. I am induced to send it to you in aid of your argument on thin sowing, and if I can give you any further information I shall be happy to do so. One fact I had nearly forgotten to mention is, that the single grain from which this has been produced, tillered into 16 stems, all bearing similar corn.—*Thomas France.*—[Your specimen is a very fine ear indeed of a large-berried Wheat. Can you give us the produce per acre of this thin-sown Wheat, compared with the acreable produce of the same variety sown more thickly? That would be information of great value. We have not yet threshed out our Wheat, and therefore cannot yet say which distance has proved most productive in our case; but we should be glad to announce the experience of our correspondent, as well as that of others, on this important subject, along with our own.]

Southampton Register of Implements.—I quite agree with your correspondent, "A Subscriber," (page 563), respecting Mr. Johnson's Register. I was much disappointed in it, and at the number of articles omitted—amongst other things, the American plough; as it said that Daniel Webster, on his return from England, stated that he had not seen any in England worthy of comparison with those of America; and there is not one churn given, there being no less than eight shown; and also six cheese-presses shown, and not one given in the Register; and by the public papers it is stated that there was great merit due to the inventors of those articles. It appears to me, if the Royal Agri-

cultural Society of England were to publish a Register of the Implements, with woodcuts of all those that prizes were awarded to, at a small price, for distribution in the agricultural districts, it would be conferring a great benefit on the public at large.—*Facile.*—[The American plough was very inferior to others exhibited—at least in suitableness to English soils.]

New and Old Land.—It is well known that the soil of an old garden is unsuitable for many plants, and that a fresh or new soil is just as favourable to them. A list of these plants would more than fill your columns; but I will select three common ones—Strawberries, Turnips, and Potatoes. Every grower of Strawberries must have seen how they delight in new earth. The old garden mould produces leaves, but the new soil fruit, remarkable both for quantity and quality. In this case, unexhausted vegetable matter may be the cause of plenty. Garden Turnips are never so sweet, or mild, or crisp, as those grown in fields, where, perhaps, they are grown every fourth year with a moderate allowance of manure. In fields too, when Turnips were first grown, they were grown from the same freshness of soil more easily and of better quality than they have been grown since, with all the advantages of modern farming. Twenty years ago I was on a visit to a friend in a part of West Norfolk, where on a good soil Turnips were introduced about 1750. He related to me the experience of his uncle, a strong-headed practical man, who remembered their introduction. I made no note of his recollections, but the substance was this :—White Turnips were grown on this farm without manure, yet with ease and certainty; they were large, and so good in quality, that Scotch bullocks were fattened on them, with Straw and Hay, without any artificial food. The old gentleman used to describe how they were gradually obliged to use manure, and yet that the Turnips lost quality; then they bought Linseed cake, and after a few years introduced Swedes. I once had a garden, in a part of which was a Grass plat some years old, of about ten yards in width. This I had dug over one autumn, for a crop the following spring. Potatoes were planted in April, beginning ten yards to the south of the Grass, the rows running across it as far as ten yards to the north of it. They were a pretty good common kind, and yielded well, but certainly half as much again in the ten yards where the old Grass had been. At the table the difference in quality was most striking; firmness, dryness, flavour, and a peculiar look of the skin, were appreciated in parlour and kitchen. Chemically speaking, what is this freshness in the soil, and can it be restored by any of the appliances of science? Common manure has no such effect.—*Rambler.* [So far as we know, your question has never yet been completely answered. Among the reasons why plants flourish better in soil new to them, than in soil on which they have long been cultivated, are, 1st, the extraction and removal from the old soil of those mineral and other substances required as food by the plant, of which it may be supposed the new land has an unexhausted store; and, perhaps, 2d, the accumulation in the old soil of excrementitious matter from the plants grown there, rejected by them as unsuited or injurious to their growth.]

Steeping Seeds.—In the early part of this year you promised to make use of Mr. Campbell's steeps, and in due time to give the result of your trial, and your opinion of their merits. The time, I hope, has now arrived, and you are prepared to pronounce your opinion respecting these steeps; and many are the small farmers who are anxiously waiting your judgment, for the railways have so reduced the supply of manures, and the feeding of cattle, as manufacturers of manure, has been so ruinous of late, that it has become a great question with them what measures to adopt in lieu thereof. If the steeps should be found as effective as the vendor pronounces them to be, they will be most valuable to the poorer farmer, who ought to be an object of your notice. The Ducie's, Miles's, Pusey's, &c. can experiment for themselves. It is said that Professor Johnston has given a recipe for steeps at a much cheaper cost; if so, you will, perhaps, be so kind as to notice them.—*J.M.* [When our Wheat is threshed out, we shall be able to state the result of the experiment alluded to, and we hope to be able at the same time to publish the experience of our readers on the subject; but our correspondent has only to look at the correspondence on the subject, which has already appeared in late Numbers of the *Gazette*, to ascertain the slight degree of importance to be attached to a single experiment. There is a great deal of contrariety in the accounts we have already received. Let the result be what, within the bounds of probability, it may, these steeps, our correspondent may rest assured, will not render applications of manure unnecessary. Indeed if, as seems probable, the vigour of germination and first growth, which the use of the steep probably imparts to the seed, be just as it were an endowment of the young plant with so many additional parts to sustain—so many additional mouths to feed—the use of manure, so far from being rendered unnecessary, will be all the more required. Professor Johnston's suggestion on the subject will be found in No. 29, *Agricultural Gazette.*]

Societies.

HIGHLAND AND AGRICULTURAL SOCIETY.

On one of the days of the late annual meeting of this Society, at Glasgow, a public breakfast took place, under the auspices of some of the leading members of the Agricultural Chemistry Society, in order to have some conversation on agricultural subjects. The question for discussion was—The best Means of making the Practical Farmer acquainted with recent Discoveries in Science, and enabling him to apply these to the Cultivation of his own Farm.—Sheriff Alison explained the object of the meeting. It was of the highest importance that the greatest amount of information regarding the science of agriculture should pervade the community, as upon agriculture, as well as upon manufactures and commerce, depended our national prosperity—national existence. In Great Britain there were twenty millions acres of arable land under the plough; twenty-seven millions in Grass and pasturage; fifteen millions which could be rendered arable; and fifteen millions of mountain pasturage. Supposing, therefore, the twenty millions to be under crop, it appeared from Mr. M'Culloch that the average produce per acre was three and a-half quarters of grain, and by the recent applications of science the average must now be more. Supposing that in addition to the present twenty millions, ten millions more are improved or put under crop, this would be equal to thirty millions acres, and at the average of three and a half quarters per acre, the produce would be one hundred and five millions of quarters of grain or other nutritious aliment. Besides, there are twenty-seven millions of acres of Grass lands, besides the mountain pasture for the rearing of cattle. The average consumption of grain by each individual in Great Britain is estimated as equal to one quarter per annum, so that even independent of the aid of science, the soil of Great Britain is capable of sustaining one hundred millions of inhabitants. And what then would be the state of our manufactures? The value of our home consumption of manufactures was estimated at a hundred and thirty-three millions per annum, and the exports, including the colonial, fifty millions, the foreign alone being thirty-five millions. Now, if the population should increase to a hundred millions, the home consumption of manufactures would increase to four hundred millions a year—eight times the amount of our whole present exports, and twelve times greater than the exports to foreign parts. It was thus demonstrated what our agricultural resources were, and how essentially necessary it was to attend to their development. During the last half century the population had doubled, and attention during that period had been chiefly turned to the development of our manufactures, yet in the 50 years ending in 1836, the amount of grain imported had been gradually diminishing. It seemed to be a law of nature, that as the population increased the power of producing food was also increased. In Poland there were ten cultivators for every one otherwise employed. In the countries west of the Mississippi there were seven cultivators to one otherwise employed; in the United States, an exporting country, three to one; while in Great Britain, by the late census, there was only one cultivator to three otherwise employed. In Great Britain there were ten millions of arable acres never yet ploughed; and, were science properly applied to agriculture, the same results would follow as had followed the application of science to travelling.—Mr. Burnet, of Gadgirth, gave instances of the benefit he had derived from the application of the discoveries of science to agriculture. Land which some time ago was not worth 15*s.* an acre, was now valued at 45*s.*, and produced large crops of excellent Wheat. In some cases where, by the ordinary practice, thirty bushels had been obtained, he had, by the application of ammoniacal manures, raised forty; and by applying saline manures, he had obtained fifty. He had applied gypsum to Clover and Grass, and found his crops doubled; the cattle preferred the Clover, and it remained three years in the ground instead of two years. He had tried gypsum with Turnips, and found it doubled the crop of Aberdeen Yellows, but had little effect on the Swedish; and he found also that gypsum had not the same effects on the crops if the soil had been previously dressed with manure mixed with sulphuric acid.—Mr. Colquhoun, of Killermont, said it is the duty of the landlords to make the experiments—they are somewhat expensive, and often fail at a first trial, and the owner of the soil, who is ultimately to be the gainer, should pay the expense. He had on this point said to an individual, "You seem to make no experiments in your business, and yet you are getting rich, while there is another individual, your neighbour, who makes many experiments, and continues poor." He admitted the fact, but the secret was, that nine out of ten of his neighbour's experiments failed, but when the tenth succeeded, he availed himself of it, and so saved the expense. Science was of the greatest importance in agriculture; but to make it available generally, it must be plainly illustrated and brought to the farmer's hearth. He hoped every one interested in agriculture would endeavour, in his own district, to disseminate information. The information conveyed in the "Quarterly Journal" was not calculated for plain practical farmers: it was too puzzling for them. It was somewhat like going to a doctor, and, on telling the complaint you were troubled with, you should be told the various medicines applicable to the disease, and asked to choose for yourself, instead of taking a prescription to the apothecary to make up for you what you was to drink.—Professor Johnston said, it was undoubted that the application of science to the soil would greatly increase the farmer's profits; but unless the Scottish farmer was put into possession of the knowledge necessary for the proper application of science—not merely a practical knowledge of agriculture, for in that they excelled—they could not profit by it. One great point would be to spread the broad-sheet among the farmers. Wherever he went, he had audiences of 200 or 300 farmers attending him, who paid the utmost attention to him, and seemed to drink in with avidity the information given them. They should, as far as possible, promote the formation of clubs, meetings for lectures, and the circulation of practical papers.

YORKSHIRE AGRICULTURAL SOCIETY.

At the seventh Annual Meeting of this Society, which occurred last week, at Richmond, a very interesting discussion took place, after the Council dinner, upon the subject of drainage. The following account is abridged from the *Durham Advertiser*:—Mr. Lister stated the mode which he pursued:—The substratum of the land upon which I have drained is principally stiff clay, my practice upon which has been this:—The minor drains are cut parallel to each other, and run directly up the hill, the depth of them being from 30 to 36 inches—the latter depth where the clay is very stiff, as I consider the more tenacious the clay the greater ought to be the depth. The main drains run partly at right angles in the hollows, being somewhat deeper than the others. Having a great abundance of stone at hand, I use it in preference to other materials. I break the stones into two sizes, viz., one about the size of road-stone and the other rather larger. In the branch drains I lay a covering of the smaller stones from three to four inches deep, and then cover them with a layer of the larger stones, upon which I put another layer of smaller stones, making altogether a depth of 9 or 10 inches. I then put clay where it can be had, and where not, turf: the clay where used is well beat over the stones; where turf is used, I put part of what has been thrown out of the drain upon the top of the turf and beat it well down—the object of which is to prevent the finer particles of the soil being washed into the drain. I find no difference in effect between covering the stones with clay and turf: the effect of both, in my opinion, is the same, except that where the drain is covered with clay it is much more durable. I would recommend those who use tiles to lay clay over them also where practicable. I am alluding to a clay subsoil; in many parts the clay is very tenacious. I think that the surface-water ought not to run into the drain through the filling in; for then the water must make its way between the active soil and the subsoil, which would be a very imperfect drainage. I differ with Mr. Arkell, who wrote the Prize Essay in the "Royal Agricultural Journal," vol. iv. He says that land lying in ridges is more easily drained, from its lying in a round form, one of these ridges only requiring drains 16 yards apart; whereas if the surface was level it would require the drains to be placed at a distance of six or eight yards from each other. I think this is not the fact; but a level surface would be as easy to drain as a round one. The active soil of my land is from six to eight inches deep; I do not use tiles; and I do not think I could fold sheep upon the Turnips advantageously, except in a favourable season. Not having to lead stones more than half a mile upon the average, I estimate the average expense of my draining per acre 6*l.*, or rather less. It is difficult to say what is the comparative improvement, because my mode of management is so materially altered. I used to have open summer fallows; now I grow Turnips, and carry out the four-course shift. I may observe that land drained is greatly improved by using the subsoil plough. The result of two experiments this year, according to my estimate, is, that my Wheat on the drained and subsoiled land will yield about 40 bushels per acre, while the land of the same character in the adjoining field, which has not been subsoiled, will only yield about 20 bushels per acre.—The Chairman, the Earl of Zetland, said: In offering a few observations upon this subject, I do not wish to throw any doubt upon the statements which we have just heard from Mr. Lister. My object is to state to you the result of the many inquiries that I have made, especially in Scotland, and I will just observe in the outset, that according to the statements which have been made to me, the plan of drainage which Mr. Lister has supported will not succeed so universally—that it is not, in fact, calculated for every kind of soil. My own opinion is certainly in favour of the system of drainage recommended by Mr. Smith, of Deanston. I should recommend that in particular lands a drain at least 24 inches deep should be cut, and that, in filling it up, parties ought not to put the clay immediately above the tile. I have lately returned from a visit to Scotland, and while there I have conversed with the farmers upon this subject, and, amongst other things, I find that one of the plans advocated by Mr. Smith is universally condemned by the agriculturists with whom I have spoken—namely, that of placing the clay immediately above the tile. All those that I have spoken to on the subject—at least all those who have tried this plan in that part of Scotland where I have been—are opposed to it. When I spoke to a farmer in Stirlingshire upon the subject, he replied, "Oh! there is not a farmer in this part of Scotland but would condemn that system." To give you an illustration with respect to this plan of Mr. Smith's:—A tenant of mine in Scotland, in draining part of his farm, turned up some stiff clay. He did not puddle the drain, but filled it up as it came to hand. The clay was of a very strong and tenacious description, and this was placed immediately above the drain, as recommended by Mr. Smith; and if I remember aright, the drain was formed 24 inches deep. This land was drained only 10 years ago, and the gentleman to whom I have alluded informed me that this year he was going to take up all these drains, because he found that the water lay upon the top of the ground, and that, too, immediately over the place where the old drains were formed. It could not percolate through the clay, and he had come to the determination of taking up the old drains, and of throwing six inches of loose stones on the top. Where the old drains existed he was only

ation to obtain very indifferent crops, while on those parts which have been properly drained his crops have been most abundant; and he feels assured that, by constructing proper drains in the whole of the land, his crops will be good throughout the farm. There is another point to which I wish to allude, as I am desirous of throwing as much light upon the subject, and giving as much information as I can, hoping that it may induce others to try experiments, and thus discover what is really beneficial and of advantage. Last year it was stated that the Duke of Portland had made about [illegible] of drains in his property, 15 or 16 inches deep, and that he was going to take them up, and sink them deeper. When I saw this statement in the *Mark Lane Express* I was unacquainted with the grounds upon which it was made, and I therefore wrote to the agent of the Duke of Portland for information upon the subject. I received an answer in due course, in which the statement was contradicted. The agent stated that he did not know upon whose authority the assertion was made, but certainly neither on his or the Duke of Portland's. My own opinion upon this subject is different from that of Mr. Smith. I think that drains in clay land cannot be made too shallow, so that the active soil is not disturbed. I believe that drains 18 inches deep—or as shallow as they can be made without disturbing the active soil—are the best.—Mr. Charnock then said—The gentleman who commenced the discussion spoke much on stone drainage. Now I apprehend that no stone drainage can be good and efficient unless you have a very considerable fall to commence with. And it ought to be recollected that the greatest portion of the drainage either formed or to be formed in this county is on land having a much flatter surface than is desirable in making drains of the description advocated by Mr. Lister. Perhaps you will permit me to allude to one or two subjects which I consider of primary importance to the attainment of effective and sufficient drainage. With respect to tiles, I think it highly desirable that the agriculturists of this county should be impressed with the desirableness and importance of choosing tiles of a smaller, in preference to those of a larger description. I conceive that there are many objections to the use of large tiles in the majority of cases. In the first place, they are of greater burden and more liable to sink into the clay on which they are placed than small ones; and in the next place they are far more expensive. With reference to the shape and length of a tile, much has been said and many opinions exp essed, but I consider that this important question is yet almost unsettled. To-day I inspected some specimens of tiles without any interna. foot or sole, which I consider would answer very well in a clayey soil; and in places where this tile can be used I should recommend its adoption, because by doing without a sole you effect a saving of perhaps 25 per cent. per acre. But there are other lands to which this tile would not be applicable. Then, as to the method employed in the filling up drains, I may mention that upon a former occasion I strongly urged the necessity of filling up immediately over the tiles with some porous substance; that is, suppose the drain were to be cut not less than 30 inches deep—but for my own part I should recommend that it generally be cut 36 inches deep—then I think that it is desirable to cover the tile over for 3 or 4 inches with some porous substance, and nothing can be used for this purpose better than loose stones or ling, and then to have the clay trodden down so as to prevent any substance from being washed by the water into the drain. In speaking upon this subject, I will just take this opportunity of stating that I think it is desirable that the water should not filter down through the drain, but that it should percolate from the arch at the bottom. And, from my own observations, I am led to think that, in general, the great bulk of the water, particularly in wet soils, finds its way into the drain from the bottom. There are many matters connected with this subject, which must remain in great doubt until actual experiment shall have set the matter at rest, and I will take the liberty of suggesting whether it is not desirable that the Council of the Society should institute some experiments for the purpose of eliciting, as far practicable, information upon the various points connected with practical and successful drainage.—Mr. Thompson, of Kirby, observed, with respect to the shape of tiles, that most people were now in favour of pipe-tiles; but he would mention a case that occurred within his own knowledge, in order to show that they were not always to be depended upon. It would be, perhaps, known that, in the earlier days of draining, the common brick was the only tile used, and this was made to form a pipe about an inch and a half in diameter. About two years ago he had occasion to open an old drain formed of bricks in this manner: the drain had almost ceased to be of any use, and he was anxious to discover the reason of the imperfect drainage of the land where this old method had been adopted. On examining them he found that the bore or hole of the drain was as nearly as possible filled with the oxide of iron. He ought to have observed that the land was nearly through not quite level, and at first when the drain was formed, it would be found sufficient to carry off the water, but the ground being impregnated with iron, the oxide had collected, and in the end, as he had stated, nearly filled up the aperture of the drain. This was the result of the experiment which he had made with reference to small pipe-drains, and he apprehended that in all cases of a similar description, it would not be a safe plan to use them. He had also opened another pipe-drain, which had been formed for a period of upwards of 20 years. The width of this drain was very considerable—being no less than six inches, and upon opening it he found that it had become stopped up in consequence of the growth of a certain description of weed which is sometimes found in drains.—Mr. Turner, agent to the Earl of Zetland, said—There is a very important fact which I think all parties ought to take into their consideration when about to drain land, and that is with respect to the after treatment of the soil. Suppose that it is intended to lay the land into permanent pasture, and that it is never intended to let a plough enter it, then I state with confidence that the nearer you place your drains to the top the better. I do not mean with reference to shallowness; but supposing that you sink, say 36 inches deep, I would fill the drain nearly to the top with stones. Where, however, I recommend this plan with respect to pasture land, I should think that I was displaying the utmost ignorance did I pursue the same system on an arable farm. In this country we are as yet but little acquainted with the advantages likely to result from the use of the subsoil plough, and all persons who can lay aside their prejudices and use this plough, will take care to lay their drains in such a manner as not to interfere with the use of such a valuable implement. There is another circumstance which I wish to mention to agriculturists generally, as it seems to have been lost sight of by the champions of the respective systems of drainage. These gentlemen seem to have forgotten that we have a natural drain-maker at work, namely, the earth-worm, and that in time, however tenacious or strong the clay may be, the soil must become more or less porous through its exertions. I think, therefore, that it is utterly impossible for you permanently to prevent the water from entering the drain. Some gentlemen have stated, and I have seen the theory advocated by certain of the public journals, that the water really passes down to the top of the drain: and there are others who contend that it enters from the bottom, but for my own part I am of opinion that it enters the drain at the sides. In forming a well, you find the water comes in at the bottom; but the cases are not parallel, because parties when they bore for a well merely sink to a spring. With regard to the best and cheapest material to be employed in making drains, until the time arrives when tiles may be obtained for 20*s*. per 1000, I think it is the duty of every agriculturist to drain with stone where practicable.—Mr. Etheridge stated that it was impossible to lay down a law suitable to every case. Surely it must be admitted that there ought to be some difference made between a surface spring and an under spring. The clayey soil of Sussex ought to be treated differently from the soil of Kent, or from that of Northumberland. With respect to the description of tile to be adopted, he considered the pipe-tile upon the whole to be disadvantageous. It was well known that on all clayey soils they were sure to meet with sand or other porous substances in digging for drains, and let the person employed in digging be ever so clever or practical a man, he would be unable to remove this matter entirely away. The consequence was that when the drain was filled up, this matter would in all probability be pressed into the joints of the pipe, which would soon become partially filled or disturbed, and, owing to its small diameter, it would in a short time become useless. He had not heard any complaints with respect to double tiles, which fitted into each other so as to prevent any matter from entering at the joints. The tiles would cost generally 14*s*. or 15*s*. a thousand, but the price would depend in a great degree upon the locality. The first item would be the price of the clay, the next the labour, and the next the quality and the distance the coal would have to be led. He could show that where the common double tile is used the expense ranged from 10*s*. to 15*s*. a thousand.—Mr. Salvin then said, by delaying to drain the land great injury was inflicted upon the farmer. The cost of manuring an acre of land with artificial manure amounted to more than 5*l*. per acre, and should this manure be put on the ground before it was drained, the consequence would be that in many cases it would hardly ever reach the seed. To show the increased productiveness of land after drainage, he stated that while in Kent he was informed by an agriculturist, that upon part of his farm the average produce formerly was not more than 24 bshls. of Wheat per acre; whereas, after it had been drained, the same land produced 40 bushels.—Mr. Crompton then spoke on the subject of liquid manure. Within the last four years he had constructed four tanks for the purpose of collecting the liquid manure from his fold-yard. The first was a very small one; and here he would impress upon any gentleman who intended to construct a tank not to follow his example, but to make it large in the first instance. He should recommend him to make it about half the size of the area of his fold-yard, and then it would contain all the liquid manure that ran from the yard. Two of these tanks were erected in stiff clayey soil, and two in porous land. Those in the clayey land held water immediately, while those in the gravelly soil had to be cemented before they became sufficiently tight. He filled these tanks three times a year, but he had found by experience, that if they had been sufficiently large, so that he could empty them at one season, the beneficial effects would have been far greater. Were he enabled to water the whole of his Grass with this manure in the spring the effect would be truly astonishing; he was convinced that if applied in the proportion of 30 cubic yards to an acre of Grass, it would be found to produce as heavy, if not heavier, crops than any quantity of other manure that could be applied. Indeed, the crops were so heavy that were they to be increased they would prove injurious to themselves. He had tested the quality and quantity of the Grass produced on the land watered by this manure with that of Grass grown on land manured with another description, and the result was decidedly in favour of liquid manure. The Earl of Zetland had published, in the Transactions of the Society, the result of an experiment which he had made with respect to the application of farm-yard manure to Grass land. The quantity of Grass grown on a certain portion of land so manured, together with its weight, was there stated. Now, when he read this statement he determined to make a comparison between the produce of this land and an equal portion which he caused to be watered with liquid manure. The Grass was dry, and the result was that he found the quantity of Grass produced on the land watered by the liquid manure was nearly double to that which had been reported by his Lordship. In this experiment he watered the land at the rate of 30 cubic yards to the acre, though generally speaking 30 cubic yards were the quantity which he used, and with this he was convinced that he obtained as good crops as any agriculturist would wish. He was only able to manure 12 acres in this manner, but then he ought to observe that he cut the whole of this twice in the year, and each time he obtained a good crop. Two years ago he applied a quantity of this manure—at the rate of 25 cubic yards an acre—to a field of seeds, and the result was, that the crop was certainly one third larger than any other in the country which he heard of. That was the only experiment which he had made with this manure on light soil, the rest having been laid on clayey land. Mr. Crompton then stated that when he began to use this manure he pumped it out of the tank with a copper pump. In less than 15 months, however, the corrosive matter in the manure completely destroyed the pump. He then got one made of cast-iron, but in less than two years this was rendered useless. He then ordered his joiner to make him a wooden one, and this had been found to answer the purpose most satisfactorily. It had been now in use five years, and did not exhibit any symptoms of decay.

Lecture in the Town-Hall.—At two o'clock on Tuesday, in the Town-Hall, Dr. Robinson, of London, author of "Chemistry for the Use of the Agriculturist," &c., delivered a lecture on The Utility of a Knowledge of Chemistry to the Agriculturist, as a Means of saving him from the Frauds practised in the Adulteration of Artificial Manures. After some general observations, in the course of which he showed the impossibility of ascertaining, without the aid of chemistry, the genuineness of artificial manures, he explained the nature and properties of guano, which is the deposit of fowls that feed on fish. He illustrated the manner in which the purity of this and other valuable manures of a highly fertilising character might be tested. The first experiments related to the blue stone vitriol, or sulphate of copper, which, though not used as a fertiliser, is known to be of considerable importance to the agriculturists in many districts, being used in the preparation of grain for seed. He said that, some six years ago, whilst at Rochester, he was waited upon by some farmers to test something which was offered by the agent of a London drysalter as blue vitriol, at 3½*d*. a pound, the usual price being 7*d*. or 8*d*. a pound. At the first sight he could not tell whether the article was blue vitriol or not, but by applying a common chemical test—namely, by dissolving a portion of real blue vitriol in a glass, and a portion of what was called blue vitriol in another glass, and adding to each a little ammonia (or hartshorn)—he at once detected the imposition, the solution of the genuine article remaining perfectly blue, while the spurious one turned black, and he thereby discovered that what was offered was green vitriol, or sulphate of iron. In order to render the latter less easy of detection, it had been powdered, and he cautioned agriculturists, as a matter of prudence and a check to imposition, never to purchase anything they might require in a ground state, if it could otherwise be obtained. Turning to the subject of guano, Dr. R. said, when pure it contained two highly fertilising properties in great abundance, namely, phosphate and urate of ammonia, as well as very fine bone-dust; and he showed by an experiment, that when genuine, it would dissolve in diluted muriatic acid or spirit of salt. After some remarks on nitrate of soda, a valuable stimulant for many kinds of Grasses, he tested it by applying a quantity to red-hot coal. The pure was shown by a beautiful bright blaze, unaccompanied by any noise; whilst, when adulterated by common salt, the presence of the salt was ascertained from the dulness of the blaze and a continued crackling. This test did not apply when nitrate of soda was adulterated with common washing soda. It then required that it should be dissolved in water, and the presence of the washing soda would be indicated by effervescence on the application of oil of vitriol; while salt was readily dissolved again in ammonia. The concluding experiment related to gypsum or sulphate of lime, and it proved that pure gypsum would not effervesce on the addition of oil of vitriol, but when common chalk, with which it is often adulterated, was present, it was indicated by rapid effervescence. All the experiments were of the most simple character, and were all performed by means of two or three common tumbler glasses.

Miscellaneous.

Experiments on Irrigation.—The first field experimented upon in irrigation contains about one-and-a-half acre imperial measure, which was lying a few years ago in a state little better than useless. From its proximity to the farm-steading, it had for many years been used as a park for the calves, which were reared upon the farm for a few weeks, until they were weaned and put to other pasture. But, as a proof of its great sterility,

when we entered to the farm at Whitsunday, 1839, we put two calves into it in the month of June, and were obliged to take them out two or three weeks afterwards, as it did not grow as much Grass as to support them. Its herbage was of the coarsest description, and although in a sheltered situation, much of the ground was unswarded, and stunted heather was beginning to show itself upon some of the driest parts, while a few straggling rushes wore a sickly appearance upon those parts which were saturated with wet. In January, 1840, we turned it over with the plough, and found the soil to be much inclined to Moss, especially in the lower part of the park. It appeared as if it had been burned at some former period, as the soil was partly mixed with ashes. In the lower part of the park the subsoil is a stiff gravelly clay, while across the middle it becomes hard and stony, and is only covered with a few inches of surface; from this part a large quantity of mineral water flowed, and left a brown ochrey sediment on the surface; nearer the top the soil is a dark-coloured earth about six inches deep, and the subsoil a fine clay. We sowed it with Oats in the spring, and, excepting a small space at the upper end of the park, it was a very poor crop. We furrow-drained it in autumn, and planted it with Potatoes in the spring following, with farm-yard manure at the rate of about 25 cubic yards per acre; the crop was middling good, being about 28 bolls, or 7 tons per acre. We then ploughed it into ridges about 18 feet broad, to answer the declivity. In the following spring we spread upon it the small quantity of about 10 bolls, or 60 bushels, of lime shells, per acre, and harrowed them in with the Oats and Grass seeds. Perennial Rye-grass of excellent quality, which had been cut after the nineteenth year, and a few pounds of red and white Clover, were the only seeds sown; the crop of Oats was middling good, being about 7 bolls, or 42 bushels, per acre; but the sward of Grass in autumn was far from luxuriant. We applied the water to it in the month of November, which was done in the following manner:—A small rill, which has its source from a few drains at a little distance, had trickled by the steading for a great length of time, without being used for any other purpose than to afford drink to cattle, for which purpose, at times, from the smallness of the run, it was scarcely sufficient. During wet weather, however, in the winter season, it sometimes swelled to a considerable size, and as it then brought the washings of the farm-road along with it, from a distance of about 300 yards, we thought it might be turned to some useful purpose in irrigation. We were in the habit of collecting all the urine from the offices into a reservoir, and carting it to the fields; but there was at times a considerable loss of that valuable liquid from the dunghill, which, when fully saturated, ran over. If, therefore, we could by any means raise the water of the rill to a sufficient height to come in contact with the refuse liquid of the dunghill, and form a small reservoir, it would then in wet weather catch all the rich washings of the premises, and conduct them over the park in irrigating rills. We managed to effect this, and we have not been disappointed. When we got the water raised to a sufficient height, we formed a main conducting flooder along the head of the ridges, and made small feeders from it to conduct the water occasionally into each ridge. The supply of water was small, and to prevent waste, we laid the bottom of the feeders with clay, which we got puddled at the clay-mill in the vicinity. The water was generally not more than sufficient for one ridge at a time, so we commenced at one side of the field, and regularly watered it ridge by ridge. We usually allowed the water to flow only about two days over a ridge, when we turned it off into another. We spread it over the ridges by damming the cuts with pieces of slate or stone. When we got once over the field, we commenced again at the other side, and continued to do so during the winter. That part of the park which lay at the greatest distance from the water was apt to get a less supply than the rest; but, fortunately, a few drains emptied themselves into a ditch which ran along the side of the park, and of this we took advantage, by raising the water in it to a sufficient height, where it had ample declivity to run along a cut made across the ridges; and we found that, from the feeding qualities of this water, and partly from a little of the more fertilising liquid soaking into it from the flooder above, that it had a most wonderful effect in promoting fertility. Indeed the effects of the irrigation were visible in a few days after this contrivance was applied. Whenever the weather was fresh during the winter, the Grass assumed a green appearance, and nothing could exceed the luxuriance of its growth when the spring set in. We allowed a few ewes and lambs to pasture on it the first two weeks of April, which kept it back a little, but commenced cutting the Grass about the beginning of June, and cut and consumed it green by horses and cows for nearly two months. Before it was all cut it was much too ripe, and some beginning to rot at the roots; but as the cattle continued to relish it, and it was so conveniently placed, we were loth to make any of it into Hay. We, however, measured and won a portion of it to ascertain its weight per acre, and found it to be 402 stones, of 22 lbs. to the stone per imperial acre. This portion was cut about the middle of the field, and might be reckoned a fair average sample. It was cut July 26, and weighed August 16. The second crop was excellent, being exceedingly heavy where the first crop was earliest cut. We commenced cutting it the second time on the 20th of August, and we cut a beautiful third crop from a considerable part of it till the frost came on the 13th of October, when its growth was completely checked, and we then allowed the cows to eat up the foggage. When cutting the second and third crops, the sward was so close, that the swathe might almost have been rolled up like a fleece of wool. Thus we have reason to believe that, by the continued application of the water, small as its allowance is, the ground may still, in future years, increase in fertility, and, of course, prove a valuable acquisition to the farm. It is now worth as many pounds a-year as it was before worth shillings, and the means which have been used to improve it have not been expensive, and any future charge that may be incurred to maintain and increase its fertility, will cost nearly nothing, seeing that the application of no fertilising ingredient is required but what heretofore ran to waste. The second portion of irrigation consists of about three imperial roods, which lie in a steep acclivity on the banks of a river. It is too steep to be brought under cultivation by the plough, and, being a dry gravelly soil, the want of sufficient moisture in summer seldom failed to render it almost useless. Having, two years ago, furrow-drained the field immediately above it, we led the main-drain in a direction where we could catch another small supply of water that came from the surrounding fields. This was nearly all that was required; we had merely to make a small cut as a flooder along the top of the bank, and another across about half way down, when we let a small supply of water into each, and the steep declivity rendered it an easy matter to spread it over the surface. We kept the water upon it throughout the whole winter, and during summer, until a week or two before commencing to cut the Grass. When the supply of water was very small, we let it run a few days in one flooder, and then in the other; but we found that it did no damage when it was allowed to run continually upon the same part. The first year the irrigation was applied, being 1842, it had no great effect, and the Grass which was cut from it was foul, and not highly relished by the cattle; but in autumn a beautiful sward appeared; and in the present year, 1843, nothing could exceed the luxuriance of its growth, the water being still applied in the same manner. The Grasses were much finer in quality than in the preceding year, and the cattle devoured it greedily. We measured and won a part of it to ascertain the weight, and found it to be the extraordinary weight of 440 stones, of 22 lbs. to the stone, per imperial acre; the Hay was cut on the 7th of August, and weighed on the 28th of the same month. Thus another small portion of land has been brought from comparative barrenness into a state of great fertility, by means both simple and cheap, as a very small amount of labour and attention have been required, and for which, certainly, we have been most amply repaid.—*Mr. Wilson, of Penicuik, in the Transactions of the Highland Society.*

On Rolling Wheat.—Agriculturists in general allow that a friable soil is favourable to the growth of Wheat; and they even recommend a harrowing in spring, to loosen the soil and promote the action of the air and the sun. In an experiment I have tried, I set out on a principle entirely opposite, founded on a practical fact. We like to trample the sprouting Wheat in October and November by flocks of sheep, for the purpose of pressing the soil. The treading of these sheep causes every trace of vegetation to disappear: yet the Wheat fields so treated look the finest in spring, and yield the best crops. This trampling by sheep must not be confounded with folding, to enrich the soil, for the sheep, in treading a field, drop very little dung, which would only fertilise the spots where it fell; but the fields thus trodden exhibit a vegetation uniformly vigorous. In the month of October, 1842, I passed my heavy roller, above 4 feet long and 4 feet diameter, and weighing about 3 tons, once over a field of about 5½ acres. The Wheat had come up, and the rolling was even and complete. In this operation I had in view to condense the soil that it might not absorb moisture, and that no water should lodge upon it, because this, in freezing, would, of necessity, injure the young plants. I also thought that compressing the soil, which promised to be particularly favourable to Wheat, would retain moisture in fine weather more effectually, and that the roots, fixed more firmly in the ground, would push up more vigorous shoots. My anticipations were realised beyond expectation; the field was uniformly covered with plants, which shot up early in the spring, and continued to flourish until harvest. All the neighbouring farmers observed it with astonishment. The 5½ acres of Wheat compressed by the roller consisted of light sandy soil, mixed with a little clay, not well adapted to Wheat, which prefers strong soil; and it had been cropped the year before partly with Wheat and partly with Oats. I had, therefore, transgressed the ordinary rules of rotation by sowing Wheat again; but I hoped to compensate this disadvantage by manuring the land. From these 5½ acres I reaped 213 bushels of Wheat, weighing about 5½ tons, and about 12 tons of straw. This is a very satisfactory produce on a light soil of moderate quality. By mistake, my whole field was rolled, and therefore I could not ascertain the difference between portions that were rolled and those that were not; but, judging from the crops of my neighbours, I must believe that the rolling of my field augmented the produce one-fourth. The compressed state of the field continued until harvest; and, from the first, I was struck with its compactness. I remarked that a weed, which grows only on highways much frequented, was collected on my field, whilst other weeds were very rare, notwithstanding the frequent rains of 1843. However, I found no difficulty in working it, and I sowed it with Turnip and Rape, some parts of which were rolled immediately after the seed was put in. I had some portions watered with solutions of salts of ammonia, and I have rolled some Wheat, leaving parts of the field untouched. Next year I shall be able to speak more positively of the effects of heavy rolling. I make a successful use of my highway roller on my meadows in early spring. A single rolling is sufficient to produce a hard, smooth surface, conducive to the growth of herbage, and easy to be closely mown.—*M. Schattenmann, in the "Annales de Chimie et de Physique," Ayrshire Agriculturist.*

Sale of Guano at Liverpool.—A cargo of guano brought by the ship Hamilton, Ross, from Ichaboe, was offered for sale on Friday, by Mr. Alexander Allan, broker, at the Sale-room in Oldhall-street. The quantity announced was 350 tons, but only 250 tons were offered, the difference having been disposed of by private contract. The article was said to be the best ever imported, and the analysis showed that it was of superior quality. It was divided into four lots of five tons each, and twenty-three lots of ten tons each. The biddings commenced for the first lot at 5*l.* per ton, and rose slowly by half-crowns to 5*l.* 10*s.*, at which it was knocked down, and the purchaser took the next lot, making ten tons altogether. The third and fourth lots were put up, and sold at the same price. The first lot of ten tons was offered at the same rate, the broker stating that no more would be sold at that price, but there were no higher biddings, and it was withdrawn at 6*l.* Twenty tons were all that was sold. The attendance was rather numerous, but there was little or no competition.

Notices to Correspondents.

Allotments.—*S. L. S.*—We quite agree with you, and will have the subject attended to fully.

Are Rabbits Game?—Rabbits are not game within the Game Act, 1 & 2 Will. IV. c. 32. We have not seen the opinion in *Bell's Life in London* referred to, and therefore do not know the precise point upon which it was given. The opinion given in a former Number is correct. We understood the question of our then correspondent to be—Whether a tenant could use a gun to kill rabbits on his land without taking out a game certificate, and we referred him to the exception in Schedule L. of 52 Geo. III. c. 93, to show that he could. *W.*

Barley and Rice.—*T. C.* asks for information on the nutritive qualities of Rice and Barley-meal, and also on the relative nutrition of the bran and flour of Wheat. Have any of our readers experiments on these matters in the fattening of cattle to report?

Clover Dodder.—*G. Kirk.*—It has probably a foreign origin, being introduced into this country with Clover seed. Mr. Babington, of St. John's College, Cambridge, requested some time since that farmers would send him specimens of this weed, and of the seed, with information as to where the seed was obtained.

Draining Level.—*Constant Reader.*—A very excellent level was exhibited at Southampton, by Mr. Bailey Denton, as you will see in our report of the Exhibition. We do not know Mr. Webster's.

Gypsum.—*A. H.*—We will endeavour to get the title of the book you refer to, for you, next week.

Names of Plants.—*J. Y.*—The small sweet-scented plant from South America is Melilotus parviflora. It has been cultivated in Botanic Gardens, but not as an agricultural plant that we ever heard of.

Professor Johnston's Supp.—*A Correspondent* was last week erroneously referred to [illegible] of the *Agricultural Gazette* on this subject; it should have been to No. 19, where he will see the following substances recommended as a steep for Corn and Beans:—Phosphate of soda, sulphate of magnesia, nitrate of potash, common salt, sulphate of ammonia—1 lb. of each, in 10 gallons of water, to steep 300 lbs. of seed. To be dried with gypsum or quicklime.

Rats.—*Proteus.*—Mr. Meyer's Rat Poison is continually advertised in our columns.

Stall-feeding.—*A Teifiside Subscriber.*—A field of six or eight acres should answer your purpose, one-third of it to each of the three roots, Parsnips, Carrots, and Mangold Wurzel. Give your cows 10 or 12 lbs. of hay each day, and as many Carrots and Parsnips as they will eat besides; which will probably be from 80 to 100 lbs. Mangold Wurzel should not be given till March or April.

Sulphate of Iron.—*C. B.*—See the advertisement over the Leader of the *Agricultural Gazette* last week.

Wood-ashes.—*Peter Drill.*—See Sprengel's Paper on this subject in this Number of the *Gazette*. You may put on 15 or 20 cwt. per acre. You need not deprive the ashes of causticity if you apply them on fallow land a fortnight or so before putting other manure in the ground. Plough them in immediately. We do not think the addition of sulphuric acid is advisable.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Aug. 19.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to	4s	2	Best Downs & Half-breds	3s	10 to 4s 0
Best Short Horns	3	8		3	10	Best Long-wools	3	6 3 10
Second quality Beasts	3	0		3	6	Ewes and second quality	3	4 3 8
Calves	3	4		4	4	Lambs	3	8 4 4
Pigs	3	4		4	4			

Beasts, 2736; Sheep and Lambs, 35,230; Calves, 153; Pigs, 295.

We have again a short supply of Beasts, and a brisk trade. Although we cannot make any alteration in our tabular statement from last week, yet there is a slight advance on the best qualities; everything is readily disposed of; the second quality is also more in demand than of late, but does not make any more money; a large proportion of the supply is of very middling quality. There are a larger number of Sheep and Lambs than last week, but the demand is also increased, and the advance realised on Friday is fully supported to-day—namely, a little more than 4s for the best Downs, and rather over 3s 10d for the best Longwools, but not a quotable advance. Lamb-trade is still worse; the season for this article is nearly closed. Veal is a rather worse trade, very few of the choicest quality making 4s 4d—indeed many very good ones are sold at 4s. Pork is much more in request at an advanced price.

Friday, Aug. 23.
